

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

# Index to Vol. VIII.—Motor-Car Journal.

The Asterisk indicates illustrated article.

**A** CCESSIBILITY and Cleanliness, 1048, 1059, 1077, 1111.  
Accidents, Motor-Car, 252, 315, 404, 442, 460, 480, 499, 518, 534, 572, 592, 612, 650, 669, 687, 706, 710, 761, 782, 830, 1021, 1042, 1063, 1069, 1124.  
Accumulators, Charging, 205\*.  
Accumulators, Hints on Charging and Care of, 588.  
Accumulators, Recent Improvements in, 800.  
Accumulators, The Capacity of, 394.  
Action of a Petrol Motor, 561.  
A.C.G.B.I. Hill Climbs, 236.  
A.C.G.B.I. Testing Apparatus, 304.  
Aerial Navigation, 1061.  
Aero Club Exhibition, 913, 937.  
Aeronautics, 161.  
Alcohol v. Petrol, 651, 1019.  
Alcohol, Industrial, 691, 1063.  
Algeria, Touring in, 488.  
Ambulances, Motor, 275, 336, 384, 582, 786, 1003.  
Anomaly, Motor-Car Law, 382.  
Appeals Dismissed, 421, 440.  
Appeals Allowed, 211, 460.  
Argyll Works, 383, 402.  
Argyll Prize Winner, 252.  
Army Motor Reserve, 501, 519, 689, 1100.  
Australian Advance, 383, 832, 983.  
Austin Car, 220.  
Australian Contest, 1001.  
Automobile Education, 4.  
Automobilism, Tuition in, 334.  
Automobilism in 1906, 993.  
Auxiliary Exhaust Ports, 1032.

**B** ALLOON Race, International, 629.  
Balloons and Motor-Cars, 702.  
Ballooning, Novel, 233.  
Balloon Racing, 423.  
Bath, Motor Union at, 465.  
Benzole as a Motor Fuel, 1105.  
Berlin, Motor-Cars in, 1011.  
Berlin, Motoring in, 966\*.  
Blackpool Meet, 555, 577, 651, 668, 674, 692.  
Bondsmen, Why be? 39.  
Brakes Desirable, Are Water-cooled? 863.  
Brecon Beacons and through Mid-Wales, Under the, 579\*, 597\*.  
Brighton Motor Road, 478.  
British Industry, Progress of the, 1023.  
Brittany, A Three Weeks' Motoring Tour in, 835\*, 862\*.  
Brooklands Racing Track, 983, 1004.  
Brotherhood Car, A Run on a, 1047.  
Brown Trophy, Albert, 272, 292.  
Bulgaria, Military Motor-Cars for, 977.  
Business News, 1124, 1142.  
Buses, Brakes on, 555.

**C** AB, Argyll Motor, 533.  
Cab, The Motor, 357, 633.  
Cairo, Progress in, 23.  
Camels v. Cars, 482.  
Camera and the Car, 767.  
Canada, A Tour in, 429.  
Canadian Progress, 358.  
Canadian Regulations, 168.  
Canning Cup, 647.  
Cape Colony, In the, 522.  
Carburettor Design, Some Requirements of, 610.  
Cases Against Motorists, 20, 38, 58, 80, 106, 136, 164, 192, 212, 232, 352, 374, 315, 334, 356, 381, 404, 422, 440, 459, 479, 500, 517, 536, 574, 591, 612, 630, 650, 670, 1002.  
Cases under the Motor-Car Act, 686, 707, 780, 828, 857, 886, 911, 935, 960, 982, 1000, 1021, 1060, 1081.  
Census of Industry, 317.  
Ceylon, 357, 1100, 1122, 1140.  
Change Speed Gear, An Automatic, 543.  
Chauffeur's Appeal, 440.  
Chauffeur's Contract, 478.  
Chauffeur v. Employer, 960.  
Chauffeur's Illicit Commission, 1006.  
Children, Motoring Dress for, 1066\*.  
Children and Motoring, 420.  
Chloride Solution, 316.  
Churches as Garages, 40.  
Claims against Motorists, 460, 480, 688.

Claims by Motorists, 1042.  
Cleanliness of Number Plates, 420.  
Clothing as Part Wages, 1022.  
Club Garages, 1126.  
Clutches, The Care of, 190.  
Comments, 1, 21, 39, 59, 81, 107, 137, 165, 193, 213, 233, 253, 273, 293, 317, 335, 356, 383, 405, 423, 443, 461, 481, 501, 519, 537, 555, 575, 613, 631, 671, 689, 709, 763, 783, 803, 831, 859, 888, 913, 937, 961, 983, 1003, 1023, 1043, 1063, 1083, 1103, 1123.  
Commemoration Number, Our, 709.  
Commercial Van Trials, 276.  
Commissions, Illicit, 984.  
Companies Registered, 164, 334, 355, 588, 611, 689, 688, 778, 801, 830, 856, 1122, 1141.  
Compression, The Object of, 6.  
Continental Notes, 8, 28, 46, 66, 87, 114, 142, 175, 199, 218, 239, 262, 283, 303, 323, 343, 370, 393, 411, 428, 451, 486, 506, 525, 544, 565, 585, 589, 623, 640, 663, 677, 702, 711, 772, 790, 810, 864, 893, 931, 953, 977, 997, 1011, 1031, 1053, 1109, 1130.  
**CONTINENTAL TRIALS, ETC.**  
Belgian Criterium, 466, 486\*.  
Boulogne Speed Trials, 467\*, 486.  
Circuit des Ardennes, 428, 486, 506, 523\*.

# THE Motor-Car Journal.

VOL. VIII.]

LONDON, SATURDAY, MARCH 3, 1906.

[No. 365.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

ELSEWHERE we give the main rules and conditions of the Scottish Reliability Trials for motor-cars, which will be held in June, with Glasgow as the starting and finishing point. The route of the 1906 trial will prove a severer test of the vehicles than that of last year, owing chiefly to the alteration in the course of the final day's run. We well remember that journey taken inadvertently on a "free lance" car accompanying the competitors, and would assure prospective motorists that cars succeeding in the trial may safely be recommended to endure any conditions likely to be met with in Great Britain. The principle underlying the rules is that the trial is a test of reliability, and its object is to demonstrate to the public the suitability and capability of the modern motor-vehicle for touring purposes. No advantage, from the point of view of marks, will be obtained by a vehicle which travels in less than the maximum times for the respective classes of vehicles set forth in the annexed schedule. Speed in excess thereof will therefore be useless. An important variation between the conditions of this and the former trial is that an absolutely non-stop performance is not now essential to eligibility for a medal award. This has been decided after very careful deliberation, and in view of the fact that a hardship was apparent as regards several cars which lost their non-stop certificates through "driving stops" or other minor causes.

### The Forthcoming Motor Show.

THROUGHOUT the country the walls of garages and motor depots are being made gay with the new poster prepared to give publicity to the Motor Car Exhibition to be held at the Agricultural Hall, London, at the end of the present month. Agents and manufacturers who have not received a copy of this artistic production, and who will be willing to give it a prominent place on their premises, are invited to send a postcard to that effect to Messrs. Cordingley and Co., 27-33, Charing Cross Road, London. The references which have been made to the Show in the Press during the last few days demonstrate the interest with which it is regarded by the public. It is very clear that a good attendance of the buying public is certain to result.

### Prospective Legislation.

FROM his seat in the Upper House Lord Montagu is still keeping watch over the interests of automobilists, and in the Commons Mr. J. H. Dalziel has somewhat anticipated the question he intends to ask next Tuesday, as to the course of the legislation to be introduced with regard to automobiles. The Motor Car Commission has not yet reported, so that anticipations as to the nature of its conclusions are, of course, only prophetic, and consequently, liable to lead folks astray. But the Motor Union must be prepared to act the moment they are issued, and then proceed to the education of M.P.'s. Now that the Chancellor of the Exchequer has promised that the national maintenance of roads must be considered by the present Parliament, it is im-

portant to keep the financial contributions of motorists to the county and national funds, in the shape of registration and licensing fees, well to the front. And with that is associated the idea that fines on motorists should be utilised for the improvement of roads, instead of being made to swell the contributions to local exchequers.

### Roads a National Charge.

LATE on Monday evening, in the House of Commons, Colonel Lockwood moved an amendment to the Address regretting that no mention was made of any arrangement for making the maintenance of public roads a charge on the Imperial Exchequer. Colonel Legge seconded the amendment, which was withdrawn after Mr. Asquith had promised to consider the matter when the general question of local taxation was discussed. We trust that the subject will not get into the rut of party controversy, but will be considered with a view to the national welfare. In the present state of local indebtedness the maintenance of main highways becomes a serious charge on the resources of the particular district—all the more irksome to bear when it is remembered that the advantages of such thoroughfares are enjoyed by people not associated with the locality as well as by residents. There are many borough and county areas where roads need re-making rather than repairing, but, owing to heavy rates, such work is scarcely likely to be undertaken by the authorities directly concerned. The whole question of roadways needs consideration in the widest sense, and we trust that the House of Commons will have regard to the national importance of the subject.

### The A.C.G.B.I. Trials.

ON Monday the cars, tyres, speedometers and lamps in the trials which commenced on Thursday under the auspices of the A.C.G.B.I. were assembled in the garage at Niagara, Westminster. Road tests will now be continued daily, excepting Sundays, till March 31st, when the 4,000 miles will have been completed and the work of the judges will commence.

### The Motor-Boat Season.

WITH the annual meeting of the Motor-Yacht Club, and the re-union that the British Motor-Boat Club will hold at the forthcoming Automobile Exhibition, the season for the motor-boat may be said to have commenced. The Motor-Yacht Club was founded by the A.C.G.B.I. in June, 1905, to take over the duties of the Marine Motor Committee elected by that body in December, 1902, to promote the interest of motoring in the water. The membership of the club is now 150, and the club has received a challenge from America for the international cup, won by Lord Montagu with Napier II., owned by Lord Montagu and Mr. Lionel de Rothschild, in the contest for motor-boats in September last at Arcachon (S.W. France). Through the good offices of the rear-commandore, Commander Mansfield Cumming, the ex-Admiralty yacht Enchantress, 1,000 tons, has been chartered for a number of years, and is now undergoing a thorough reconstruction prior to her being taken over as a floating club-house. The Enchantress will, besides

affording the usual club-house accommodation, comfortably berth thirty members. She will be moored off Netley, communication with Southampton being maintained by means of a fast motor-launch.

#### A New Motor-car Service in India.

A MOTOR-CAR service which will entirely revolutionise the journey to the principal hill station in the Bombay Presidency is being inaugurated by the Western India Motor Company, of Bombay. Mahabaleshwar is the station in question, and has hitherto been reached from Bombay only by a most trying journey. The train has to be taken to Poona, next a light railway to Whattar, and thence by "tonga" twenty-one miles to the ancient town of Wai, which is famous as being the centre of Brahminism, and is happy in the possession of no less than twenty-five temples, to which pilgrimages are made from all parts of India by the devotees of this religion. From here the tonga is again taken, and the journey continued by stages to Mahabaleshwar. When it is stated that the last eighteen miles of the run has a mean gradient of 1 in 10, and that the horses employed by no means represent the highest class of animal, the dreary slow rate of travel will be easily realised. A total rise of about 7,000 ft. has to be negotiated

The Beaufort 18-22-h.p. Brake ascending Netherall Gardens, N.W.

during the journey. Under the new regime a fleet of thirteen Beaufort brakes and lorries will take care of the traffic. The brakes will meet travellers at Poona Station, conveying them the seventy-four miles to Mahabaleshwar in about four hours, handbags and other small luggage being carried on the roof of the canopy, while the lorries will bring up the heavy luggage; it is anticipated that a saving of seven to eight hours will be effected. One day last week the Beaufort Motor Company afforded us an opportunity of testing one of the brakes, which, by the time these lines are published, will be on its way to India. The vehicle, of which an illustration is given above, has accommodation for about nine passengers. It is fitted with a Beaufort standard 18-22-h.p. four-cylinder engine, having low-tension magneto ignition, supplemented by accumulator and trembler coil for starting purposes. An important point in securing the order was the ability of the motor to keep cool under continuous heavy loads and gradients. On the trial run referred to the car showed not only a good turn of speed on the level but on the various hills in Hampstead now so largely used for trial purposes. Netherhall Gardens was included in the journey, and on the steep part of this well-known gradient the car was brought to a stand and started away again without the least difficulty.

#### Inquiry at Guildford.

ON Friday of last week Mr. F. J. Willis held an inquiry on behalf of the Local Government Board into the application of the Corporation of Guildford for the issue of a regulation with regard to the speed of motor-cars within several important thoroughfares. Mr. C. G. Mason, the Borough Surveyor, outlined the proposed areas of restriction, and gave evidence as to the lengths, widths and gradients of the scheduled roads. The total length of the main road through the town, which included part of London Road, the whole of High Street and Portsmouth Road, was nearly two and a half miles, of which it was proposed to limit the speed limit over a distance of 2,530 yards, or nearly 1½ miles. In his opinion, the following places were exceedingly dangerous for fast driving: The intersection of York and Waterden roads with London Road; the upper part of High Street; the Ram Corner, where the width was only 13 ft. 6 in. between the kerbs; the remainder of the High Street, on account of its steep gradient and busy traffic; the Portsmouth Road, at the junction with the High Street; and owing to the fact that at St. Catherine's Valley there was a falling gradient of 1 in 26 from the town, and 1 in 16 from St. Catherine's Hill. Owing to the excessive speed of cars, warning boards and signs had been erected, without any good results. Macadam roads and busy thoroughfares, such as these in question, were quite unsuitable for fast traffic, especially in wet weather, when cars were continually skidding into the side walks. In reply to the inspector, Mr. Mason said it was really the side-slipping, in his opinion, that constituted the great danger in Guildford, especially in High Street.

#### The Opposition.

THE chief constable, Mr. W. A. Worlock, said he regarded the fixing of danger signals as a failure. At the same time, he was opposed to the laying of traps for motorists, despite the fact that probably 50,000 motorists passed along the High Street during the year. On behalf of the opposition Mr. Rees Jeffreys contended there were no exceptional features in Guildford that called for a restricted limit, and argued that the chief thing at the back of the application was to facilitate convictions against motorists. The people the regulation would hit were the considerate drivers, who would be liable, even when driving considerably, to prosecution for a technical offence. Mr. R. W. Buttemer, hon. secretary of the West Surrey Automobile Club, said he had driven over 60,000 miles in motor-cars. The proposed regulation was not desirable in the least; it was an entirely wrong principle. Dr. Fennings, of Farncombe, thought the proposed limit was quite unnecessary, and Dr. Mitchell, of Guildford, said it was perfectly safe to ride on an average fifteen or sixteen miles an hour in the borough. Mr. E. E. Pullman, Guildford, Colonel Fairtlough, chairman of the West Surrey Automobile Club, and Mr. A. King, Guildford, also gave evidence in support of the opposition, and the inquiry then closed, the sitting having lasted over five hours.

#### After-dinner Oratory.

THOSE familiar with the trend of after-dinner oratory on laudatory occasions are not disposed to cavil at the effusive speeches of their hosts, nor need they accept their conclusions as the Omega of the matter in question. Judging from correspondence received this week—some of which is couched in terms too strong for publication—it would appear that a gentleman connected with the motor trade has been enlightening the public as to the proportion of business done by British and foreign firms. Figures relating to the latter branch are easily obtainable; statistics concerning the former are absolutely unreliable. Thus, one firm was approached to supply particulars of the output to a rival manufacturer; in return, information as to the workpeople was given. Of course some makers gave certain details concerning their output, but, after the aggregate result has been obtained, it is clear that they

should be accepted with much reserve. One of our correspondents, delighting in the *nom-de-plume* of "Janus," asks whether any real advantage can accrue to the British industry from the agitation thus aroused, and wonder whether consistency of opinion would qualify for impartial association with the British Empire Motor Trades' Alliance, Limited, and the Importers' Association. Such conundrums must be reserved for festive occasions; they are not problems for newspaper solution.

#### Motor Progress in Egypt.

ACCORDING to a recent report there are now 170 motor-cars in Egypt, 56 of which are in Alexandria, and 110 in Cairo. These figures would be much higher were there more facilities for motoring available, there being a great want of good roads in the country. In fact, beyond the Ramleh road in Alexandria and the Pyramids road in Cairo, measuring together less than twenty miles, there are nothing but agricul-

leading hotels on all the main roads—preferably on the country outskirts of the great towns. Where necessity requires motor-houses are to be provided, so that motoring members will never be stranded for want of combined automobile garaging and personal accommodation. The scheme is somewhat ambitious; but of its utility there is no doubt.

#### A Warning to the Police.

NONE too soon the authorities have issued a warning to the police reminding them that the object of the witness-box is not to secure convictions, but to enable the magistrate or judge to ascertain the truth. That such has been a difficult question every motorist knows full well; and the new order should prove a useful deterrent to those constables who have been inclined to exaggerate when giving evidence. The suppression of material facts which are known to the police is, in future, to "constitute misconduct of a grave nature"; and the

The River Nile, near Cairo, on which Motor Launch Trips may shortly be popular.

tural roads, which are practically impossible for motor traffic. The construction of a road which would join Cairo to Alexandria is projected, and the Government is to be approached in the matter. If such a road were made it would not only facilitate communication between the different parts of Egypt, but would afford tourists a good run between the two cities. As regards motor-buses the Société des Omnibus du Caire has recently imported two De Dietrich vehicles, with which trial runs are at present being made. It is also reported that a company has been formed to introduce a service of motor-launches on the Nile.

#### The Road Club.

ELSEWHERE we record the formation of the Road Club, which has been started to include motorists, hunting, and coaching people and others willing to assist in "a revival of the glories of the road, and to pursue the delightful pastime of road touring under more favourable conditions than have hitherto been available." Private club rooms will be secured at the

extension of facts until they become fiction should be equally a misdemeanour. Now that the authorities have told the police to be truthful, they might go further and advise the magistrates to be impartial when dealing with motor cases.

#### Motor-Buses in London.

THE inaugural luncheon of the London Power Omnibus Company, Limited, at the depot in Langton Road, Cricklewood, was a notable affair. As Captain Deasy remarked, the building in which the guests were assembled was the largest of the kind in the world, and accommodation for 150 motor-buses is provided under cover. The facilities for filling the petrol tanks are such that a dozen omnibuses can be loaded simultaneously, and as many more batteries can be charged at the same time. An acre and a-half of land is covered by the depot, and the Willesden Urban District Council naturally welcomes the coming into their area of a motor-bus company that promises to do much for the development of the district.

In giving his benediction to the enterprise the Hon. Arthur Stanley, M.P., said he regarded the motor-omnibus as the solution of the traffic problem. Unlike the electric tramcar, which not only interfered with everything else on the road by claiming the middle of the track, but also interfered with itself, for when one went wrong every car following it had to stop too, the motor-omnibus interferes with nobody. People preferred motor-omnibuses to any other mode of conveyance, and it would not be long before the motor-omnibus had supplanted every other public means of rapid transit in the streets of London. He strongly urged the necessity of every driver passing an examination for the Automobile Club certificate, which would ensure not only competence, but also reliability.

#### Car for the King of Siam.

UNDER the rule of King Somdeth Phrea Paraminda Maha Chulalongkorn Siam is making good progress. Bangkok, the capital, has good roads, and although an electric tramway has given the natives a new method of reaching the outer suburbs, they are kindly disposed towards vehicles of a mechanical kind that do not run on tracks. His Majesty King Chulalongkorn is particularly partial to the motor-car, and we have just witnessed the despatch of a fine vehicle from London to his dominions, where it will doubtless be regarded much in the light of a State car. On a 28-36-h.p. Daimler chassis the

Lacre Motor Car Company (Limited) have fitted a seven-seated Roi des Belges body with a canopy of the three-screen type, each window being made to slide into the roof when not required for use. The car has an eleven feet wheelbase, and, finished in a Royal red, is a really noteworthy example of British carriage work.

#### Prosperity Sharing.

SEVERAL firms in the automobile industry have successfully introduced the idea of prosperity sharing so generally adopted in the larger works of the United States. Others are doing all they can for the convenience and comfort of their people while at work. The idea has found expression in the Argyll Works at Alexandra, where the leisure hours of the employees are provided for, as well as the working day. It is usual for large industrial companies having factories situated in the country to set aside a special messroom for the use of their employees at meal times. At the Crayford (Kent) Works of the Wolseley Company this idea has, by the energy of Mr. L. Silverman, the works manager, been extended, so that the opportunities which the possession of such a room affords for social evenings are taken full advantage of. The whole of the necessary fittings and furniture have been purchased with the proceeds from the small nominal charges made for attendance and cooking the staff dinners, at the same time leaving a good balance at the bank sufficient to meet all expenses in the organisation of any special functions. The hall,

which is now splendidly furnished, is the headquarters of a gymnasium and sports club, while a works' orchestra provides musical selections at the dances and social evenings which are a regular feature of the winter programme. The idea is worthy of emulation throughout the country, and news of other firms which have adopted the notion will be welcomed.

#### Motor Car Lamps.

THE proposal of the Motor Union that special trials should be held of motor-car headlights, so as to discover the make or makes which, while effective for the requirements of automobilists, are yet free from the brilliancy and glare of which the public complain, has had the effect of stimulating both lamp manufacturers and inventors, and we understand the Union have already received intimations of a desire to enter for any special trials that may be arranged. It is earnestly to be hoped that, should trials be really proposed, some effort will be made to secure an adequate entry, so that the experiences in connection with recent trials organised by the Club may not be repeated. In fact, we are not quite sure that makers of lamps, who, after all, are the people who will decide the matter, would welcome such contests. Experience gives the best clue to the conditions required to be fulfilled, and motorists will extend their patronage to the manufacturers of those lamps which most suit their purpose. Of course, if the Motor Union can be assured of the possible entry of all the leading firms, its efforts will be valuable, otherwise there is considerable doubt.

#### Motor Parcels Delivery Schemes.

THE registration of the London Motor Parcel Express, Limited, and the London and Provincial Motor Dispatch Company, Limited, as limited liability companies, each with a capital of £10,000, is a matter of interest to those who have long predicted the use of the motor-van in connection with the delivery of goods. It seems to make the failure of the van trials projected by the A.C.G.B.I. all the more regrettable, for private enterprise will have to buy the experience that it was hoped would be freely available as the result of official competitions. The objects of these companies are to carry on the business of carriers, railway and forwarding agents, bonded and common carmen, and, of course, the automobile will bulk very largely in the actual operations. The directors are all directors of Messrs. Carter, Paterson and Co., Limited—a fact which adds to the significance of the development, which we chronicle as an indication of the inroads that the mechanical vehicle is making into the prejudices of commercial men, who are not likely to risk profits with horses unless they see a likelihood of their recurrence with motor vehicles. In the strictly utilitarian vehicle for business and commercial purposes our own makers have had a long success, and may be expected to share in the manufacturing expansion that the formation of such companies as the London Motor Parcel Express, Limited, foreshadows.

#### Automobile Education.

THE movement for the extension of technical education in automobile matters is developing on right lines. We have already recorded the new equipment at the Bradford Technical College. Now comes news of the purchase of a chassis by the authorities of the Battersea Polytechnic and the presentation of a motor to the Glasgow University College for experimental purposes in connection with Professor Barr's lectures. Such indications of the growth of public favour are encouraging.

At his premises in Bridgeland Street, Bideford, Mr. W. H. Elliott has facilities for general motor-car repairs.

THE Automobile Club of Hawaii has recently been formed at Honolulu with a membership of about seventy.

MR. C. H. E. RUSH, of 199, Piccadilly, W., is acting as consulting motor-car engineer to the Duke of Sutherland. He is also acting as licensed valuer to the automobile trade.

## THE SCOTTISH RELIABILITY TRIAL.

ONE of the most arduous motor-car trials ever carried out under official supervision was that of the Scottish Automobile Club in May of last year. It has been decided to repeat the contest on June 13th, 14th, 15th and 16th next, and the rules have just been issued by Mr. R. J. Smith, the hon. secretary of the Club, whose association with the trial is one guarantee of success. The principal rules and conditions provide that the trial is open to motor vehicles driven by persons registered with the Scottish club or the A.C.G.B.I. Only one car of any specific make and horse-power will be accepted, and no cars will be considered of different horse-power unless the cylinder capacities vary by at least fifteen per cent. The vehicles entered will be classified as follows:—

- A. Petrol vehicles, the selling price of the chassis of which does not exceed £200.
- B. Petrol vehicles, the selling price of the chassis of which exceeds £200 but does not exceed £350.
- C. Petrol vehicles, the selling price of the chassis of which exceeds £350 but does not exceed £500.
- D. Petrol vehicles, the selling price of the chassis of which exceeds £500 but does not exceed £650.

E. Petrol vehicles, the selling price of the chassis of which exceeds £650.

F. Steam cars.

No petrol car showing more than 12-h.p. on the basis of the following formula will be allowed to have a seating capacity of less than four:—

$$\frac{\text{Cylinder diameter in inches}^2 \times \text{number of cylinders.}}{3}$$

The trial will form practically a non-stop run, as the only stops not causing loss of marks are compulsory ones, and stops for tyre troubles under one hour in all. During these no repairs or adjustments to the car, other than adjustment of brakes (for which five minutes will be allowed on each of the second, third, and fourth days without penalty) will be permitted. No marks will be given for speed in excess of the minimum fixed.

There will be a maximum number of marks for the run, deductions being possible on the lines usually observed in such events. Stops for tyre troubles will not be reckoned in determining the title of a competing vehicle to a non-stop certificate or its eligibility for a medal award.

All vehicles will have to be fitted with recognised touring bodies, and the fuel and water tanks will have to be of the ordinary size and capacity as usually sold to the public.

The club will offer an efficiency gold medal in each class. The award of the medal in each class will be made to the car making the best performance on the following basis:—

800 marks will be the maximum for reliability.

100 marks will be allotted to the vehicle in each class making the best time in each hill-climbing test adopted, and the others will be allotted a percentage equivalent to their respective performances, and the average of the marks so gained will be taken, 100 being consequently the maximum possible.

100 marks will be allotted to the vehicle in each class showing the lowest fuel consumption per ton mile over the whole trial, and the others will be allotted a percentage equivalent to their respective consumption per ton mile.

The medal will be awarded to the vehicle in each class obtaining the highest aggregate marks, expressed in the following formula:—

$$\frac{\text{Marks gained for reliability} + \frac{\text{Total marks gained in hill-climbing tests}}{\text{Number of hill-climbing tests}} + \frac{\text{Lowest petrol consumption per ton mile in class} \times 100}{\text{Fuel consumption per ton mile}}}{3}$$

The proposed itinerary is over a course of 673 miles. On the first day the run will be from Glasgow to Edinburgh by way of Ayr, Dumfries and Peebles; the second day's run will be to

The Sarthe Circuit, on which the Race for the Grand Prix will be held. The Village of Connerre.

[Bariller, Le Mans.

Aberdeen over the route made familiar last year; then will follow a severe test from Aberdeen by Tomintoul and Kingussie to Pitlochry, finishing on the fourth day in Glasgow, a deviation from last year's course being made by avoiding Aberfeldy and going through the picturesque village of Killin—an alternative route described in the *M.C.J.* last May.

WITH this issue the *M.C.J.* commences a new volume.

MESSRS. G. T. RICHES AND CO. are removing from Gray's Inn Road to 19, Store Street, London, W.C., where they will commence business on the 12th inst.

THE 14-h.p. Star car built by the Star Engineering Company to the order of the A.C.G.B.I. has been delivered this week. The vehicle is to be used for instruction purposes, and a novel feature is the provision of a third pedal, by means of which the tutor can control the clutch and foot brake independently of the pupil.

A STRANGE sight was witnessed on the Thames Embankment, London, on Wednesday morning. An electrical motor brougham was travelling speedily along when suddenly the back axle snapped clean in half, allowing the two motors to fall on the road. Fortunately, the car did not overturn, nor were the passenger and driver seriously hurt.

## SOME CURRENT TOPICS.

### Which Brakes should be mostly used on Live Axle Cars?

In our Correspondence columns this week Mr. F. F. Wellington makes reference to a point in motor-car operation which is deserving of close attention. His suggestion practically amounts to a recommendation that in cardan shaft live axle cars the brakes most generally used should be those acting on the hubs on the rear wheels, that on the gear or propeller shaft being reserved for emergency purposes. Something may, of course, be said for the other side of the question, but the reasons advanced by Mr. Wellington seem to be sound. In any case, we shall be glad to have the opinions of motorists on the matter, especially of those whose automobile experience includes both chain-driven and chainless cars.

### Improving Compression in Old Cars.

In the more modern petrol motor a marked increase in compression over that in the older patterns is noticeable. It is not surprising, therefore, that many of the earlier vehicles will not develop the power they should. In many cases the compression can be raised with beneficial results by applying a plate of cast iron to either the top of the piston or to the inner side of the cylinder head. The latter method is to be preferred, because any weight added to the piston will destroy the balance of the motor, unless the other moving parts are altered to correspond. The proper thickness of plate to give the best results is largely a matter of conjecture, and if one of the later models of the engine to be altered can be secured, and a comparison of the compression spaces made, this will be the better way. Otherwise the original percentage of compression space should be secured, and the desired percentage subtracted from it, when it will be a simple matter to make a wooden pattern containing the number of cubic inches necessary. The compression plate should not, under any circumstances, obstruct the port openings to the valves, and in many motors this will necessitate chamfering away the pattern at the part adjacent to the ports.

A Group of Peugeot Cars outside the Garage of the Caledonian Motor-Car Company, Ltd., Aberdeen.

### The Object of Compression.

It may not be clear to everyone why the gaseous charge in the cylinders of a petrol motor is compressed before ignition, especially since the compression absorbs power. By compressing the charge before ignition a proportionally higher explosion pressure is obtained, and also a much higher mean pressure during the explosion stroke. Much greater power is therefore obtained from the same engine, and the thermal efficiency—i.e., the relative amount of power obtained from a certain amount of fuel—is also increased. Generally speaking, the higher the compression the greater the power of an engine of given dimensions and the greater the fuel economy; but there is, of course, a limit beyond which it is not advisable to go, which is fixed by the conditions that when the compression is too high the charge is liable to ignite spontaneously at a too early period—a phenomenon known as pre-ignition—that the motor is hard to start (for the first explosion the charge must be compressed by hand), and that if the piston and valves are not a perfect fit a considerable part of the charge is likely to leak out.

### Ascertaining Compression Space.

A well-known engineer has suggested the following method of readily ascertaining the original percentage of compression space in an internal compression engine. Have the inlet and exhaust valves closed and the piston at its innermost position. Now through the ignition plug opening, the cylinder being placed so that this is uppermost, fill the compression space with water from a rectangular vessel, the cubical contents of which may be readily computed. Find the displacement in cubic inches of the piston, and with these two factors the clearance percentage of any motor, no matter how irregular its port passages, may be readily calculated.

THE capital of the Deasy Motor Car Manufacturing Company, Limited, is £150,000.

MESSRS. C. J. RICHARDS AND Co., of Pontypridd, are specialising in motor repair work.

DEPOTS for the Arrol-Johnston cars are about to be established in important towns by the Arrol-Johnston Agencies, Limited.

## THE DE DIETRICH 60-H.P. CAR.

WE are able this week to give illustrations and some particulars of the new 60-h.p. De Dietrich car, the first of which has just been received by Messrs. Jarrott and Letts, Limited, the British agents, and which is the property of Mr. R. Douglas Croall, of Edinburgh. The motor, which comprises four cylinders of 150 mm. bore by 175 mm. stroke, has been considerably simplified, there being only one

Fig. 1.—View of De Dietrich 60-h.p. Motor.

cam shaft, which operates both inlet and exhaust valves, in addition to the tappet rods of the low tension magneto ignition. The inlet and exhaust valves are interchangeable in all their parts—springs, pins, etc. To examine the valves all that is necessary is to loosen the bolts holding down the covers of the same, an operation which can be performed very quickly. The covers over the inlet valves form the ignition plates, and are arranged to receive the ignition plugs, which in the 1905 models were fitted at the side of the cylinders. On the motor itself is fixed the pump, carburettor and rods controlling the throttle. Inspection doors of such a size as to allow the heads of the connecting rods to be easily examined are provided in the base chamber. The carburettor, which is of the float feed spray type, has an auxiliary air inlet, which is automatically worked by the throttle plunger, giving the engine its full amount of air when the throttle is opened fully, thus securing a great variation of speed, light consumption, and quietness of running. The mechanical lubricator is of the improved Dubrulle type, having the oil pump driven by an eccentric off the cam shaft. There is also a large auxiliary oil tank fitted to the side of the frame, which automatically feeds the main lubricator on the dash board. The pipe providing the release for the air in the base chamber is arranged to serve as the spindle for the bracket carrying the air-inducing fan behind the radiator, which is of the framed ribbed-tube variety. The bracket is free to slide on the pipe and is held up by a spring, so that the fan driving-belt is always kept at the right tension. The flywheel is also provided with arms arranged to act as a fan. The arrangement of the throttle has been much simplified, and the tubing of the motor is also arranged in a neater form, so that access to the engine is facilitated. The water circulation is secured by a gear-driven pump. No advance and retard mechanism is now provided in connection with the ignition, the starting of the engine being facilitated by the aid of a half-compression device, by means of which part of the compression is released. An accelerator pedal

is provided, and the clutch pedal is connected up with the throttle to prevent racing when the clutch is withdrawn.

The clutch, which is of the leather-faced cone type, is centred on the crankshaft of the motor itself, and can be easily detached and entirely dismantled if required. The pivot of the clutch is fitted with ball bearings, and is connected with the gear-box by means of a strong shaft fitted with two universal joints, thus making it very easy to take down and put together, and giving extreme suppleness to the transmission. Similar joints are also introduced in the differential shaft. The change-speed gear is of an entirely new pattern. It is of the sliding sleeve type, with gate motion for the speed lever. The locking arrangement is contained in a separate box from the change-speed portion of the gear. All the shafts run on ball bearings, including the steering gear and the axles. The control of the car is on the same system as that so successfully employed on the 1905 cars, with the exception that the accelerator pedal is placed a little farther back between the clutch and brake pedals, in a more convenient position.

Three double acting metal-to-metal brakes are fitted, a wide one on the differential shaft and one on each of the rear road wheels. The foot brake is actuated by means of a push pedal; the side brakes are internal expanding, and are operated by a pull-on hand lever placed on the off side of the change-speed lever. The brakes on the back wheels are exceedingly powerful, and, owing to the compensating arrangement fitted, gradual in their movements. The friction is obtained by expandable segments, not directly connected with the controlling lever, inside a steel drum entirely closed and fixed by bolts to the road wheel sprockets. The action of the lever is transmitted to both wheels equally by means of an exceedingly simple compensating arrangement which prevents unequal friction being put on the wheels. The adjustment for taking up wear in the steering is of a practical character, making it possible to take up the slightest

Fig. 2.—Rear View of De Dietrich 60-h.p. Chassis.

play whenever it may occur. The small petrol tank on the dash-board, previously fitted to the 1904 and 1905 models, has been done away with, and pressure to the petrol tank for starting the motor is obtained by means of a small hand pump fixed on the dashboard. The chassis is arranged for the fitting of comfortable and roomy side-entrance carriage bodies, the weight having been distributed over the four wheels, in order to minimise the danger from side-slip. Altogether the new car is an excellent specimen of modern motor engineering.

## CONTINENTAL NOTES.

### The Voiturette and Tri-car "Criterium."

The six days' reliability contest for voiturettes and tri-cars, known as "Le Petit Criterium," and organised by "Les Sports," has been held during the past week. Eight entries had been received in each section, but of these only five tri-cars—a Griffon, a Quentin, a Bruneau and two Australs—and three voiturettes

The Voiturette and Tri-car Trials.—M. Civelli de Bosch on the winning Gregoire Car.

—a Vulpes and two Gregoires—started on the first day's run, which was from Suresnes, near Paris, to Evreux, and back by a different route. All the competitors successfully made the run, Barriaux on the Vulpes being the first home. On the second day the journey was to Evreux and back, the reverse route being taken. Bucquet on the Griffon tri-car made the best run, while the Quentin and one of the Australs gave up. On the third and fourth days, six competitors set out for Gaillon, all safely returning to Suresnes in the evening, a similar remark applying to the runs to Chartres on the fifth and sixth days. The final awards are as follows:—

VOITURETTES.			TRI-CARS.		
Driver.	Car.	Penalty Marks.	Driver.	Tri-car.	Penalty Marks.
1. C. De Bosch...	Gregoire...	233	1. Bucquet...	Griffon...	787
2. Barriaux.....	Vulpes.....	457	2. Foulon.....	Bruneau..	1298
3. Cornil.....	Gregoire...	1570	3. Guitard...	Austral...	1414

### The Circuit European.

An important meeting of delegates of the French, German, Austrian, Italian, and Belgian clubs was held in Paris on Sunday to settle the details of the International Touring Contest to be known as the Circuit European. It has been decided that there shall be four classes for petrol cars:—No. 1, cars in which the total piston area is under 86½ square centimetres, and which will be required to maintain an average speed of 19 miles per hour; Class 2, cars having total piston area of not more than 226 square centimetres, 22 miles per hour; Class 3, ditto, 346 square centimetres, 25 miles per hour; and Class 4, ditto, 531 square centimetres, 28 miles per hour. Steam cars will be admitted to the contest, they being classified on a basis

which takes into account the heating surface of the boiler. It has also been resolved that observers are not to be carried on the cars, the order of the competitors being based on the records taken by official timekeepers at the start and finish of the morning and afternoon sections on each day's run. The following itinerary and programme was decided upon:—

July 26.	Paris-Limoges.	Aug. 5.	Klagenfurth-Vienna.
" 27.	Limoges-Toulouse.	" 6.	Exhibition at Vienna.
" 28.	Exhibition at Toulouse.	" 7.	Vienna-Prague.
" 29.	Toulouse-Nîmes.	" 8.	Prague-Breslau.
" 30.	Nîmes-Grenoble.	" 9.	Breslau-Berlin.
" 31.	Exhibition at Grenoble.	" 10.	Exhibition at Berlin.
Aug. 1.	Grenoble-Milan, via Chambery.	" 11.	Berlin-Hanover.
" 2.	Exhibition at Milan.	" 12.	Hanover-Cologne.
" 3.	Milan-Treviso.	" 13.	Exhibition at Cologne
" 4.	Treviso-Klagenfurth.	" 14.	Cologne-Reims.
		" 15.	Reims-Paris.

The test will thus extend over twenty-one days, of which six will be devoted to exhibitions.

### The Nice Automobile Week.

Judging from the programme which has been drawn up, the 1906 automobile week at Nice promises to be of a more interesting character than last year. The event will open on March 25th with a flower fete; on March 27th a tyre changing competition for drivers is to be held, and on March 28th an elegance competition at Monte Carlo. The speed trials will commence on March 29th by the mile events on the extension of the Promenade des Anglais, Nice. Only cars weighing between 650 and 1,000 kilogs. will be allowed to compete. These will be followed by the flying kilometre contest for the Henri de Rothschild cup. The programme on Saturday, the 31st March, will consist of a hill climb on La Turbie road, over a distance of 9 kilometres, and a 500 metre climb from a standing start, for the De Caters cup.

The Voiturette and Tri-car Trials.—M. Barriaux on the Vulpes Car.

### French Exports of Motor-Cars.

According to returns just issued the exports of automobiles from France last year attained a value of no less than £4,016,000, as compared with £2,852,080 in 1904, and only £376,680 in 1900. Of last year's total it is estimated that England is responsible for £1,702,880; Germany, £488,000; Belgium, £416,440; America, £265,880; Italy, £193,360; Algeria, £146,560; Argentina, £125,000; Spain, £101,200; and Switzerland £76,680.

## My Way of Tinkering.

WE have been favoured with the following practical notes and advice from an individual who on a memo. head describes himself as a motor repairer and expert. From independent inquiries we learn that up to recently he followed the calling of a plumber and house decorator, and that the staff comprises the expert and an erstwhile plumber's mate. Our readers may, therefore, estimate his notes accordingly.

### Curing a Slipping Clutch.

Nothing is more annoying to a motorist than a slipping clutch. If paraffin won't cure it, there are several other methods. My firm not long ago had a car to attend to for this cause. It was effectually cured as follows: Two coatings of the best quick drying varnish was applied to the leather with a brush. It was given half a day to set. The clutch never slipped again. We are now fitting new gears, and have informed the owner that we expect to have the car completed by about Easter.

### Repairing a Cracked Chassis.

This is an extremely difficult job that should only be entrusted to a most competent repairer. My firm recently had a 25-h.p. car in for repair. The motorist said it was difficult to steer, and that there was a harsh, metallic noise when travelling over rough roads, as though something had broken. It was thought that the wheel axle bearings had worn or that the teeth of the cog wheels had broken. We spent three days in removing the body and enlarging the garage, after which we found that the chassis plate had cracked. A repair was effected as follows:—A plate was soldered over the split and firmly secured with boiler rivets, and after being painted over was not noticeable. We charged £12 6s. 8d. for the week's job, which was exceptionally cheap under the circumstances. We have since heard that the car has been badly damaged as a result of a smash, and are estimating for the repair.

### A Tube Repair.

A passing motorist called and said his cover and tube had burst. We suggested that he leave it at the garage for a few hours. After packing the cover with tarpaulin we removed the inner tube and fitted a patch. Then the tube was put in the enamelling oven for sixty minutes. When removed it was hard and brittle and the patch had curled off, due to the tube being of inferior manufacture. We accordingly recommended a new tube (from a customer's car), which was eventually fitted. We explained that the bulge in the cover would subside after a little running on the road.

### Fitting a New Bush.

We were recently perplexed over a certain car that was brought in for repair. The motorist said that his engine knocked badly on hills, and we suggested in all probability the cylinder needed hammering down, but as the bolts were found tight it was proved that internal troubles were responsible. After examination, it was seen that the connecting rod bush had worn oval, so I turned up a new bearing out of the solid brass, and as it slipped in rather easily, I sweated it in place to avoid any possible trouble. After several other new bearings were made and fitted, we put the motor together again, but in starting she kicked so badly as to break the piston rod clean in half, besides nearly breaking my arm off. The owner, who knew nothing about it, said that I had upset the timing. Three days' time in fitting new piston rod £3 19s., plus 45 hours' work in overhauling, £12. Another exceptionally cheap job!

### Broken Valve Repair.

A motorist in distress called and said that he had been obliged to leave his car half a mile down the road, as his exhaust valve had broken. I said that, although pressed with work, I would undertake the repair, so went to the car and extracted the two broken bits of valve and told him that in a couple or so hours I would return with the valve repaired and as good as new. It was an extremely difficult job, but practical repairers ought to be able to cope with any repair. The broken ends were dovetailed and pinned, and afterwards the valve was tinned over so that it appeared to be a new one. I returned to the car and fitted the valve, but the motorist said it was too short. I explained that it would expand with the heat, but he said it was useless to attempt to try and get the engine to run with a short valve. I returned to the works and sweated on a piece of solid metal so as to make the valve longer. After fitting the valve the engine started first turn. Charge:—Half-day's time, 18s. 6d. N.B.—The following day I received a most abusive letter from the motorist saying that I had botched the valve and it broke again. He threatened to report me to the Automobile Club, but I replied that I would supply and fit a new valve at a reasonable cost. To this he did not have the courtesy to answer.

### Shaping and Fitting new Exhaust Pipe.

There was a considerable noise outside our garage a few mornings ago, and a gentleman entered and said his car was creating such a noise that he already had been stopped three times by the police that morning, besides sending several horses out of control. To the practised ear it was at once evident that the motor exhaust was faulty, and on examination I found that the exhaust pipe had dented and split. Under the circumstances I advised him that it would be unsafe to venture any further on the car until a repair was effected. The broken pipe was then removed and a length of standard bore gas pipe obtained from the store room. This after being cut and bent to shape was provided with the necessary unions, and when fitted up the car ran silently. The charge for this repair was not excessive, and the motorist expressed himself satisfied with the job. The following morning we were surprised when he called in a towering rage and handled a large heavy stick menacingly. For safety's sake I thought it prudent to lay hold of the largest shop hammer, after which I asked him to state his business. Considerably subdued, he impertinently said that his car was not a water cistern, and if we wanted the gas pipe back we could go with the melting pot and pick it up in the road. I quite lost my temper then and ordered him out of the premises. N.B.—A summons arrived this morning.

Owing to growth of business we have found it imperative to remove at once to larger and more suitable premises.

THE new National 50-70-h.p. six-cylinder car will be shown by Messrs. Lamb Brothers and Garnett for the first time at the forthcoming Show at the Agricultural Hall, London, N.

MESSRS. FRISWELL, LIMITED, have just issued a very useful pamphlet, giving detail instructions as to the driving and upkeep of the Peugeot two and four-cylinder cars. It is a translation by Mr. J. H. Paterson, President of the Scottish Motor Trades Association, of a similar work issued by the Peugeot Company, and should prove of valuable assistance to users of Peugeot cars.

## THE "E.I.C." GENERATIVE SYSTEM FOR IGNITION AND LIGHTING.

THE Electrical Ignition Company, Limited, Birmingham, have lately brought out an interesting generative system for ignition and lighting purposes on petrol cars, of which the following are among the most salient features. A generator (Fig. 1) is fixed on to the car in the same manner as a magneto, the size and weight being somewhere about the same

Fig. 1.—General View of Generator.

as that of the latter. The machine, which absorbs about one-third horse power, is of the low speed class; it commences to generate current at about 500 to 600 revolutions per minute, and at that speed it automatically cuts into circuit with the accumulators and commences charging them. At any lower speed the dynamo automatically cuts out of circuit, and the tendency of back E.M.F. or reverse current accentuates this function and makes the same positive. The generator gives eight to twelve volts and about four amperes, and no matter how the speed may advance by the increased speed of the motor the windings are so arranged that the output practically remains constant, this result being achieved by the special method of compound winding adopted, by which any excess current demagnetises the fields and so automatically causes the output to drop to normal without any outside mechanical appliances. The old trouble experienced in dynamos previously introduced for this purpose

Fig. 2.—The Automatic Cut-out.

of a sudden acceleration of speed by the motor resulting in a great excess of current being generated, which broke down ignition, is in this way claimed to be avoided. The pressure developed by the generator is from 8 to 12 volts, which enables two 4-volt accumulators to be charged in series, and, moreover, always kept fully charged. In conjunction with the generator a patent cut-out is fitted (Fig. 2), which automatically puts the generator in circuit when the voltage of the dynamo rises above that of the accumulators, the dynamo energising the coil at 4 volts, so

completing the circuit. When the speed is reduced to a point when the voltage of the accumulators predominates, the reverse current operates the coil and cuts the dynamo out. The accumulators are therefore always maintained at 4 volts, so that it is an impossibility for the car ever to be stranded by want of current, as, even if the dynamo stopped, there is always a reserve of current which will run the engine for a very long period. The two accumulators used in connection with the system are of the new E.I.C. solid type; these are made without plates, the positive elements being inside the porous pots, which form the negatives, and which are made of a special material, quite different from anything else on the market. The cell is claimed to be practically indestructible, and cannot be damaged by overcharge or excessive discharge. The current of these accumulators is used at 8 volts in series for lighting, and at 4 volts alternately for ignition purposes. The coil (Fig. 3) employed in connection with the arrangement is a special one, known as the E.I.C. double spark coil, which is so arranged that each trembler will cause a spark to jump across the terminals of two plugs in each cylinder. The makers claim that this double ignition not only makes a breakdown from plug troubles practically an impossibility, but increases the power of the engine, a quicker and more powerful explosion resulting from the charge being fired at two points. By keeping the accumulators fully charged not only is the ignition

Fig. 3.—The "E.I.C." Double Spark Coil.

made reliable, but it is possible to light the tail and side lamps on the car electrically. In conjunction with the tail light a small safety lamp is fitted on the dashboard, which automatically lights up if the rear light goes out from any cause. For motor-bus work the E. I. Company supply a larger size generator which enables a greater number of accumulators to be used, thus providing for the electric lighting of all the lamps on the vehicle. We understand that the company have had the system running for some time with perfect results, and owing to the reliability it provides in the way of ignition, together with the great advantages for lighting purposes, it is worthy of attention from all interested in motor-cars, and especially from those in the public service branch of the industry.

MESSRS. MANN, EGERTON AND CO., LIMITED, send a new catalogue of the cars in which they deal, which comprise all the leading types.

A CATALOGUE of "Scout" cars comes to hand from Messrs. Dean and Burden Bros., of Salisbury. It includes a complete description of the firm's 14-17-h.p. car, which made a creditable showing in last year's Tourist Trophy race, running upwards of 180 miles on 9½ gallons of petrol. The illustrations of working parts are very well done, and the catalogue should be extremely useful to motorists favouring British-made vehicles.

## ENGINE SPEED CONTROL.

### AN EXPERT OPINION IN FAVOUR OF THE VARIABLE LIFT INLET VALVE.

**R**EFINEMENT of finish and control of the petrol motor, and the constant endeavour to make the engine flexible in the strictest sense of the word, has been the means of makers adopting a variety of methods to secure this end. Amongst the different systems used the variable lift to the inlet valves has been most satisfactorily exploited, and during the past year this has been brought forcibly before the notice of the public. Whatever the means employed to accomplish the variable lift—and from an engineer's point of view there is a right and wrong way to do it—the result is what we are dealing with.

Looking at the matter on general lines the principle is decidedly good, and forms a perfect throttle, as by it the control of the amount of vapour admitted to the cylinder approaches that of a steam-engine in effect, and it is possible to drive very slowly on "top gear" and accelerate by opening the valves to full lift and glide off very gently as the lift is increased and the full power developed. It also obviates the necessity of controlling the mixture, as by this form of throttle the carburettor ought to have an automatic air supply permitting a greater proportion of air according to the speed of the engine. The throttling takes place in exactly the right place, and has an instant effect, both when being closed or opened, and there is always a supply of mixture ready to draw upon stored up in the inlet pipe on the valves being opened again; whereas in the ordinary throttle valve of the plunger or butterfly type the operation of throttling has a tendency to altogether upset the working of the carburettor, and the vapour is exhausted as far as the throttle valve. When accelerating, moreover, the sudden suction on the carburettor causes a rush of petrol and naturally some moments elapse before the mixture assumes the right proportions again. This is a wasteful way of control, not experienced with the variable inlet valves, for the reason that there is vapour to supply the engine still in the pipes, as in a reservoir. The suction on the carburettor is much more gentle, and on accelerating the carburation accommodates itself better to the speed of the engine, due to the fact of the difference in position of the throttle and the effects therefrom. A variable inlet will allow the engine to run at a much lower number of revolutions per minute, and the car can be kept and run on the high gear at slower speeds, even to crawling pace. The makers I have discussed the matter with seem to generally acknowledge the most effectual method of securing flexibility of the engine is best obtained by the use of variable lift inlet valves; and this form of throttle is now very common, seeming to prove the undoubted practical advantage of so controlling an engine. An additional throttle, I feel confident, is a superfluity, and, without improving matters, only complicates and defeats the simplicity admittedly obtained. Chauffeurs say that with the variable inlet there is hardly any need to alter the ignition, except a slight retardation on hills; therefore the engine is kept to a certain extent cooler.

Some of the foremost firms use this type of control, and it will be found that a variable petrol jet, in addition to the variable valves, as a means of economising consumption, has also undoubtedly a great effect in securing silence and flexibility, and the advantages gained from this refinement of control are worthy of discussion later on. It is well known that such means of controlling the petrol supply have long been used in the finest-made cars.

Flexibility is not to be secured by using carburettors having air and gas adjustments, needing continual alteration of the position of the levers for every variation of the speed of the engine. This interesting subject is of great importance; those mostly concerned are the makers, and their views and reasons would enlighten the motoring public, but it certainly seems that the principle of controlling by means of the variable lift has the advantage.

R. S. G.

## USEFUL NOTES.

**MOTORISTS** are sometimes puzzled by a sudden loss of power apparent in their cars, so a few words concerning this may not be out of place. In the case of atmospheric valves, the inlet valves are very frequently the source of loss of power, and it must be remembered that the temper of the valve springs is not a certain quantity, as it is liable to be affected by the heat. The inlet valves should be looked at first of all.

A **SHAFT** which has a little play owing to a slightly worn bearing acts as a hammer to increase the play. Moral, take up looseness as often as it appears, without waiting for it to get serious.

A **TYRE** valve should not be allowed to go without its cap, or at least a substitute for a cap. Dust is sure to work in and interfere with the seating of the valve, and the result will be a slow, steady and most annoying loss of air from the tyre. If the cap is lost tie a scrap of rag over the end of the valve stem to keep the dust out, and get a new cap at the first opportunity. A couple of extra caps occupy practically no space in the tool-box, and should be carried at all times.

Mr. and Mrs. Leicester Barwell and Family, of Ascot, on their Leon Bollee Car.

**UNLESS** certain that there is no vehicle close behind you, never make a sudden reduction of speed or come to a quick stop without giving a warning signal. The customary way of announcing the intention of slowing or stopping is to raise one hand in the air, so that those following may see it readily. Rear end collisions are undesirable, to say the least, and there are frequently occasions when they may easily occur if this simple method of signalling is neglected.

**HIGH-TENSION** current is very difficult to insulate, and will leak away through the most unlikely channels. If the ignition acts strangely and the trouble cannot be located in the usual ways, look for a high-tension leak. The elusive current will frequently follow oily wood or cloth, if given an opportunity, causing the most mysterious short-circuits and sometimes "shocking" the driver most unexpectedly.

If the front tyres of the car are wearing more rapidly than they should, it is well to examine whether the wheels are parallel. The least departure from parallelism causes a certain amount of sliding friction between the tyres and the road, with disastrous results to the covers.

## AN ITALIAN RELIABILITY TRIAL.

—•—

IN connection with the forthcoming International Exhibition in Milan the Automobile Club of Milan is organising an important reliability trial, to be held from the 15th to the 25th May next. The event, which is to be known as the "Coppa d'Oro," will be open to all types of cars, divided into three classes, as follows:— (1) Cars the chassis of which cost more than £320; they must carry a body having accommodation for four passengers, and which must not weigh less than 440 lbs.; two seats at least must be occupied. (2) Light cars, chassis price of which is between £160 and £320. (3) Voiturettes costing not more than £160 complete. The vehicles in the different classes will be required to run each day over the allotted distance at the following average speeds:—Class 1, not less than nineteen and not more than twenty-five miles per hour; Class 2, not less than fifteen and not more than twenty-one miles per hour; Class 3, not less than 12½ and not more than 16½ miles per hour. The mean speed

miles, the majority of the daily runs being over 250 miles. In Classes 2 and 3 the itinerary will be reduced to nine days, the circuit being from Milan *via* Bologna, Lucca, Florence, Genoa, Turin, Milan, Como, Brescia, Verona, Mantua, Lodi and Milan. Cars in the second class will start on May 16th, and in the third class on May 18th. There are no less than ten prizes offered in Class 1, ranging from £1,000 and a gold cup—the Coppa d'Ora—to £20 each for the eighth, ninth and tenth cars. In Class 2 there are four prizes, ranging from £120 and a members' cup, of the Milan Club to a gold medal, and similar awards are made in the third class. A team prize will be offered in connection with Class 1, which will be known as the Grand Prize of the Milan Municipality. A prize of £200 and the President's cup will be also awarded to the lowest-priced car in Class 1 to run successfully through the whole of the trial. A prize, to be known as the Grand Prize of Industry and Commerce, subscribed for by manufacturers and dealers in Italy, will be divided among the owning drivers who win in their respective classes. All entries should be sent to the Sports Secretary of the Automobile Club

A Pretty Snapshot from the Orange Mountains District, twenty miles from New York.

will be calculated from the hour of the departure to the hour of arrival of each day's run. Any excess of the maximum speed will count double points against the competitor. If the maximum is exceeded by fifteen minutes on any one day's stage the competitor will be disqualified. The winner in each class will be the car that approaches most nearly the maximum speed throughout the entire trial for its class. In the case of a tie the award will go to the car of the lowest chassis price. The course to be covered runs through all the most beautiful and historic parts of Italy from Milan to Naples. The cars in Class 1 will be required to make eleven daily runs as follows:—First day: Milan, Brescia, Treviso, Bologna; second day: Bologna, Perugia, Rome; third day: Rome, Naples; fourth day: Naples, Rome; fifth day: Rome, Siena, Florence; sixth day: Florence, Parma, Genoa; seventh day: Genoa, Piacenza, Turin; eighth day: Turin, Arona, Milan; ninth day: Milan, Mantua, Verona, Udine; tenth day: Udine, Vicenza, Brescia; eleventh day: Brescia, Cremona, Milan. The total distance is about 2,500

of Milan. The list closes on April 1st, but cars may be entered up to the 20th of that month by payment of a fifty per cent. increased entry fee.

COLONEL FOX, of the London Salvage Corps, has just perfected an important invention in connection with motor-car axles. By the new method the axle is built up of a thin steel rod, around which are fitted numerous steel tubes until the required thickness is obtained. These are then welded by heating processes until the whole is, to all intents and purposes, one solid bar of steel, which can then be treated in every way as if it had been made in one piece. The advantage of the construction will be obvious, for, even assuming there is a flaw in each of the tubes, no breakage can occur unless all the flaws happen to be in exactly the same place, an extremely unlikely possibility. The Farman Automobile Company have secured the entire rights in the new invention, and their "Mascot" cars will in future all be fitted with the patent unbreakable axle.

A 30-FT. motor launch is being built at Dumbarton for a mission station at Calabar, in the Niger Protectorate.

THE Duke of Westminster has placed an order with the London and Parisian Motor Company, Limited, for a 30-35h.p. Hotchkiss car to be fitted with a Hooper limousine body.

At 6, Royal Exchange Square, Glasgow, the Palmer Tyre Company, Limited, has opened a depot.

MR. W. R. BELL has been lecturing before the Dundee Institute of Engineers on motor traction.

MESSRS. L. G. BALE AND CO. are proprietors of the Barnstaple Motor Works, Newport Road, Barnstaple.

THE Roads Improvement Association intends to re-introduce its Bill for the improvement of roads during this session of Parliament.

THE Highways Committee of the Westminster City Council are recommending the purchase of a motor-wagon, with interchangeable water-tank body, from the Lancashire Steam Motor Company, Limited.

THE Osaka Automobile Company has five motor-wagonettes in daily operation in Japan. They have accommodation for a dozen passengers; the chassis were supplied by the makers of the White steam car.

THE Liverpool Motor House, Limited, is opening a garage at 6, Atherton Street, South Castle Street, Liverpool, under the management of Mr. John Wilson. They will act as sole district agents for the Arrol-Johnston cars.

THE Motor Union have prepared a statement of hints and suggestions for the conduct of motor-car gymkhanas. These suggestions have been circulated to the various clubs included in the membership of the Union for their information and guidance.

MESSRS. THOMPSON, MCKAY AND CO., carriers to the Great Central Railway Company, have been making experiments with a five-ton Hercules steam motor-wagon. A further order has just been given and delivery made by the Hercules Motor Wagon Company, Levenshulme. The Hercules Company will shortly place a motor-omnibus on the market with engine of 40-h.p., having a specially designed gear-box for heavy work and change speed on the locking gate principle.

THE Maudslay Motor Company, Limited, have sent us copies of the new catalogues they have just issued. They deal respectively with the Maudslay pleasure cars, heavy vehicles, and marine motors, and, in addition to full particulars, contain a large number of well-executed illustrations.

MESSRS. PERCIVAL, MARSHALL, AND CO. have just published a handy little Engineers' French-English Technical Dictionary. It has been compiled by M. Lvoff, who, himself a practical engineer, has devoted special attention to the principal terms used in connection with mechanical engineering, electricity, motor-cars, and cycles. The book is of a useful pocket size, and the work has, on the whole, been well done. A few of the motor-car terms might, however, be revised; for instance, we do not think a contact-breaker is known as an *allumeur* and *manivelle*, while certainly a crank is, in motor parlance, the starting handle. The word *chassis*, too, has a wider meaning than that given by M. Lvoff.

THE motor-house of the A.C.G.B.I. has been provided with an Adams jack.

THE equipment of the new laboratory in connection with the motor-car department of the Bradford Technical College will

include an engine specially built by Messrs. White and Poppe, of Coventry.

MESSRS. BINGHAM AND STEVENS are opening business at 20, Store Street, Tottenham Court Road, London, W., as dealers in motor accessories.

MUCH attention is being given by practical motorists to the vulcanising specialities of the County Chemical Company, Limited, of Birmingham.

THE New Ellis Motor and Cycle Company, Limited, has been registered with a capital of £1,000, to acquire the business of Mr. R. Ellis, at 120, High Street, Watford.

FROM the North British Rubber Company, Limited, comes the Motorists' Vade Mecum for 1906, in which much useful information with regard to the speed of cars and the main roads of England is given in addition to some valuable hints on the care and repair of motor tyres.

THE Reo Motor Car Co., of Lansing, Mich., U.S.A., have issued a little novelty in the shape of a mutoscope thumb book illustrating in a clear but simple manner the action of a four-cycle petrol motor.

THE Midland Counties Motor Garage Company, of Granby Street, Leicester, have issued an excellent catalogue illustrating their facilities for the repairs of cars, recharging of accumulators, etc., as well as cars for which the firm act as agents.

CREABE is the cognomen of a new soap introduced from 10, East Parade Chambers, Leeds, which can be effectively employed with cold water. At the same time it is sufficiently moist to be used without water in the event of none being obtainable. It is, therefore, invaluable for motorists.

THERE are three motor-car firms at Rotorua (New Zealand), and when the mail left all were unable to cope with the large

demand for cars in that district caused by the tourists preferring to hire motor-cars rather than make the various sightseeing trips in coaches. This is easily understood, for while the drive to Taupo takes nine hours behind four horses, it is easily accomplished in a motor-vehicle in four hours.

OF the many forms of speed indicators, the Veeder Tachometer, or speed indicator, has become well known since put upon the market by Messrs. Markt and Co. The principle adopted is that of centrifugal force acting on a coloured liquid contained in a reservoir. A small force pump is geared down against the car wheel (for convenience on one of the steering wheels), and is connected by metal or rubber tubes to the reservoir and indicating scale on the dashboard. The fluid acted on by the pump as it rotates under the influence of the car wheel is drawn down from the reservoir into the pump, and forced up the indicating scale, each speed being exactly determined by careful experiments. It is claimed that when once this instrument is fitted, and the liquid sealed up, the machine is practically in calibration for all time, or until the car is worn out, because the manufacturers claim that this instrument, having nothing to wear, will outlive the car itself.

MESSRS. D. M. WEIGEL, LIMITED, have taken offices in Goswell Road, E.C.

MOTOR JOBSTERS, LIMITED, is the title of a company registered with offices at 79 and 80, York Street, Westminster.

MESSRS. STRANSOM AND SONS are making an interesting show of motor-car accessories at their showrooms in Market Place, Reading.

THE Wallsend Council is making application to the Local Government Board for regulations to limit the speed of motor-cars in certain streets of the borough.

AMONGST the latest patterns of lamps introduced by Messrs. Weldhen and Bleriot, Limited, the British manufacturers of the Bleriot lamps, is a very interesting one in the shape of a square side lamp, fitted with a petrol burner. It is really a smaller type than that sold by the firm during the last few months, and is finding much favour amongst all those who are buying new side lamps. The new type gives a bright light, and as it burns petrol is always as clean as an electric lamp. The construction of the burner ensures safety, and we are pleased to be able to give an illustration of a lamp which is likely to be a great favourite for use on broughams or landaulets.

THE University Motor Garage, opposite the Victoria University, Manchester, has been opened with accommodation for a hundred cars.

MESSRS. HARTENFELD, SON AND CO., LIMITED, have a fully equipped motor garage in Sykes Street, Manchester, which is open day and night.

A THORNYCROFT 24-h.p. double-deck 'bus has recently been put in service in Bombay by the Western India Motor Company. We understand that several additional vehicles are on order.

MESSRS. BALFOUR AND SONS, of Jedburgh, N.B., have an Albion motor-van in use for general delivery work. It is fitted with a 16-h.p. two-cylinder engine. In the last nine months it has run 5,000 miles, the upkeep working out at 1½d. per mile.

THE International Motor Insurance Company, Limited, has been formed with a capital of £100,000 to undertake motor-car insurance, to which operations it is to be confined. Mr. W. S. Hartley is the general manager, and offices have been taken at 207, Deansgate, Manchester.

THE Continental Tyre and Rubber Company have brought out a motor tyre accessory box suitable for private garages and motor-car owners, and containing large quantities of all repair material necessary in connection with the upkeep of motor tyres, also repair outfits in different sizes, puttees, tyre levers, etc.

THE Young Street Motor Garage Company, of Young Street, High Street, Kensington, W., has issued an attractive tariff of their terms for the hire of motor-cars either by time or distance. Their garage is always open, and a special feature is made of Darracq cars, for which the firm acts as agents.

MESSRS. J. HUTTON, SONS, AND CO., of Dublin, referring to a rumour that they proposed opening the motor section of their business on Sundays, say that they have never entertained the idea, and were they "to adopt Sunday trading in any form it would be entirely against the principles which have guided this firm for close on two centuries."

THE Turner's Motor Manufacturing Company, Limited, are just completing large extensions to their works at Wolverhampton, to enable them to take up the construction of commercial steam cars. The first lot of vehicles to be laid down will be suitable for loads up to about 30 cwt., or to carry from sixteen to twenty passengers. The engines are similar to those fitted in the Turner-Miesse pleasure cars, but, of course, of greater strength and power; they are of the single-acting, three-cylinder type without any glands or packing, and, apart from lubrication, will require no attention. The chassis will be provided with an improved form of generator and paraffin burner which have been subjected to a lengthy test.

THE Sheffield Motor Company are exhibiting a collection of Argyll cars at the Sheffield Show.

MESSRS. KELL AND DELOTZ are commencing business at 38, East Street, Farnham, as motor-car engineers.

WE hear that a writ has been issued in respect of infringement of the patent covering the "gate" method of change-speed gear control.

A MOTOR-CAR company is being formed at Crieff (Perthshire), with the object of letting cars out on hire during the summer months.

THE Imperial Tyre and Rubber Company, Limited, of Brooke Street, have enlarged their works at Clerkenwell, and are giving special attention to the repair of old covers.

THE Coventry Chain Company, Limited, have issued an effective picture postcard, drawing attention to an important contract for the Daimler Company for the coming season.

FROM the Adams Manufacturing Company, Limited, we have received a copy of the new catalogue of the Adams-Hewitt car they have just issued. In addition to a full description of the vehicle, illustrations are given of several of the principal component parts.

THE Service Company (London), Limited, which is the new name of the Civil Service Motor and Cycle Agency, Limited, has issued a pamphlet giving a comparative statement of the cost of motor-cars. This will be of service to prospective motorists, and useful for reference throughout the motor trade.

SOME trials of a new petrol-electric car, known as the Auto-Mixte, were carried out at Charlton last week. The leading details of the vehicle, which is of Belgian construction, were given in our report of the Paris Salon, but it may be mentioned that a 24-h.p. petrol motor is directly connected up to a dynamo, and thence through a magnetic clutch, cardan shaft, and bevel gear to the rear live axle. The dynamo is arranged to act both as a generator and as a motor, and in circuit with it is a small battery of twenty-six Tudor accumulators. By an ingeniously-arranged controller the full power of the engine can be employed to drive the car, or, on an easy road, any excess can be utilised in causing the dynamo to charge the accumulators; while, thirdly, when it is desired to increase the speed of the car or assist the engine on a hilly road, the accumulator can be called upon to increase the power by converting the dynamo into an electric motor.

The above illustration depicts the first of the 1906 type 20-25-h.p. Mercedes landaulets to come into this country. Messrs. Duncro-Mercedes, Ltd., inform us that the chassis in question is specially built to take landaulet and side entrance coachwork, and will permit of a body being fitted to seat four or five persons inside and two outside.

UNDER the title of "County of Gloucester Garage," Messrs. H. E. Steel, Limited, have opened their new premises in the High Street, Cheltenham. Although the large workshops and garage which they are building at the rear of their showrooms, and which will have an auxiliary entrance on a side street, are not quite completed, they are perfectly competent to undertake any repairs at their existing garage in Regent Street. The directors of the company are Messrs. H. Ripley, J.P. (chairman), H. E. Steel, and H. E. Ripley.

## CORRESPONDENCE

(Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, W.C.)

### THREE-CYLINDER ENGINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Mawdsley Brooke's letter in your last issue, re three-cylinder engines, was especially interesting to me, as I have recently patented a three-cylinder engine, which I think will correct about all the faults Mr. Brooke finds with the three-cylinder, four-stroke cycle engine. My motor is of the three-cylinder, two stroke cycle type, with cranks at 120 degrees, giving a torque equal to a six-cylinder, four-stroke cycle engine, and having some other advantages besides the great reduction in the number of parts, weight, and space occupied. For instance, all crankshaft and connecting rod bearings will be in constant thrust, in which respect it is comparable to the Willans high-speed steam engine with air buffer, making a silent running engine even after considerable wear has taken place in the bearings. The exhaust is swept out very completely and positively, each stroke, and the

has taught me a lesson that in future I must not only see that the lever is in its lowest position, but that the action has been continuous throughout the system. The point is one which it may also be worth the while of other motorists whose cars are fitted with the Bowden control to take notice of.—Yours truly,

FUNNEL SWITCH.

### WHICH BRAKE SHOULD BE MOSTLY USED ON LIVE AXLE CARS?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think it would not be amiss to call the attention of your readers to the advisability of paying special attention to the methods now universal in driving motor-cars with cardan shafts. It has frequently come to my notice of late that drivers and owners are ignorant of the fact that to use a foot brake that is connected to the propeller shaft, or to the projecting shaft from the gear-box, is disastrous, and destroys more quickly than anything else the life of the small pinion. As the cardan shaft is now almost universally used, it is the more necessary that this explanation should be given, as it will be of help to those motorists who have studied and learnt mostly from the chain-driven cars. When riding with notable drivers, I have been surprised to see how severely they have used their foot brake, without considering the effect on the life, and the wear and tear of the back axle; whereas if the side brakes were used when de-clutching, the strain is only dis-

A Motor Meet at Colombo, Ceylon. The illustration depicts a 7-h.p. Oldsmobile and three Wolseley cars.

cylinders filled with fresh air at slightly above atmospheric pressure, no pressure in crank chamber. The fuel is introduced during the compression stroke, without the use of a carburettor or vaporiser, and fired electrically in the usual way.—Yours truly,

T. W. KINGS.

### A HINT RE BACK FIRING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I recently wrote you with regard to the trick the engine of my car paid me by continuing to run after the current had been switched off, owing to the circuit having been completed by a funnel which had been jolted against the two terminals of the switch. Now I have to tell you of another little act of bad behaviour on the part of my motor, which resulted in an injury to the little finger of my right hand; fortunately it was no worse. The air throttle and ignition control on the engine is by means of Bowden wires, the levers actuating the same being located on the steering pillar just below the wheel. The other day, when about to take the car out, I took the usual precaution to see that the ignition lever was fully retarded. To my surprise, however, the engine gave a nasty back-kick, which resulted in the injury mentioned. On inquiring into the cause I found that although the lever was fully down, the contact maker itself had not been correspondingly retarded, the wire, instead of passing down its sleeve, having curled up just below the lever. While I attribute this more to the weakening of the spring attached to the contact maker, by which the latter is retarded, than to any fault in the Bowden wire mechanism, it

tributed on the road wheels, and, generally speaking, the purchase of a hind brake is a third greater than the foot operated one; not only so, but the fact must not be overlooked that when the foot brake is used, it is the means of causing a back lash, and a great strain on the differential and the small bevel pinion, which is generally keyed on to the cone of the propeller shaft.—Yours truly,

F. F. WELLINGTON.

### AN ENGINE QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a four-cylinder 24-30-h.p. car which I have now been driving for nearly six months, but am sorry to say it has very seldom run right; it is very little used on account of trouble when mostly starting away with the car. It runs very well for the first mile or so and then one cylinder will miss fire and then another will do the same. Then the car will be running on two cylinders—first one cylinder and then another will miss fire. Next engine commences to knock and then in a few minutes all four cylinders will fire correctly and the car will go splendidly, but on coming to a small hill knocking will commence again, and it seems as if the engine has not enough power, but that I put down to the misfiring; the carburettor is correct, as there is a good flow of petrol and all seems clean. The four tremblers on the coil seem to all have a nice buzzing sound as I have them nicely adjusted, but I may say that one cylinder misses fire more than the other, and has done so ever since the car was bought, nearly six months ago. I have wondered if it could be the fault of the coil, as everything else seems right. I have

even put a new high tension wire and new plug to the cylinder that misses most, but it does not make it any better. The carriage drive to the house is very steep. The car never comes up under four minutes, while the horse can pull a brougham up in seven minutes. I think it is ridiculous for a car of such a power to take so long a time.—Yours truly,  
ANOTHER CONSTANT READER.

[The misfiring complained of by our correspondent may be due to many causes. This kind of misfiring generally occurs when the contact breaker is dirty, or perhaps coils are adjusted too tightly. If these are not the causes, we should recommend that the aid of a competent man be obtained to thoroughly inspect and locate the difficulty, as nothing is so annoying as electrical troubles.]

### THROTTLE VALVE OR VARIABLE LIFT ?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We notice a correspondence is now taking place in your journal on the above subject, and as the original introducers both of throttle control (1893), and of variable lift inlet valves (1895), our views on the subject may perhaps be not without weight. We have used both systems, and there can be no doubt whatever that control by the variable lift of the inlet valve is more correct than the other. It is the most perfect system possible. It controls the admission of the mixture at the nearest point to the engine, and secures a more constant mixture in the supply passages, ready for use as the valves open, and in practice we have found that a higher degree of flexibility is obtainable by this method than with the simple throttle on the induction pipe or throttle at the

system of the two. I would, however, point out that by using the variable lift in conjunction with the auto-mechanical valve an entirely different condition of things is arrived at, which places the variable lift far in advance of the throttle system. By this combination the time of opening is constant and the time of closing variable, thus giving a more uniform action on the jet of the carburettor.—Yours truly,

ROBERT E. PHILLIPS.

### THE INSURANCE OF DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I beg two lines of your valuable space to make a personal statement that the insurance company which treated me so badly was not the General Accident Corporation, of whose Motor Board I am chairman? I find this statement necessary owing to misunderstandings which have been brought before me.—Yours truly,

MARK MAYHEW.

[This has reference to the letter from Lieutenant Mark Mayhew which appeared in our issue of the 3rd ult.]

### MISFIRING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "Anxious One's" query re misfiring in the back cylinder, last year I was troubled in the same way, and found that it was owing to the joint between the cylinder and the inlet pipe not being tight—in fact, in my case it was cracked round the flange. The reason for

A General View of the London Power Omnibus Co.'s new Garage at Cricklewood. (See page 3.)

carburettor, as is usually the case. An engine will run steadily at a less number of revolutions with variable lift valves than it will if fitted with throttle inlet pipe only. We have tried both methods on the same engine and have further used them both together with a still further increase in flexibility. As fitted to our American cars, using automatic induction valves, the method of controlling the lift is exceedingly simple, and we only discontinued its use in our British-built cars because of the demand for the mechanically-operated valves, with which, although it is not impossible to secure the variable lift, it adds quite a little complication to get it. As throughout our system we give simplicity first place as against complication, and as we are able to obtain with the throttled inlet pipe a sufficient amount of flexibility for practical purposes, we decided that the advantages to the user were probably more fully met by the simpler construction, though, had we been able to combine the variable lift valve with its mechanical operation, without adding more parts than those required with automatic valves, we should certainly have preferred to do so.—Yours truly,

THE DURYEA MOTOR COMPANY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Whichever of these methods is used to control the running of internal combustion engines having mechanically-operated valves and employing a jet carburettor, the effect is to produce a constantly varying action on the jet of the carburettor, which even the best of the "automatics" fails to entirely minimise. As Mr. Percy Richardson says, there are many points that affect the question as to which is the better

misfiring is that when the throttle is closed it is much easier for the cylinder to suck air through a bad joint than mixture through a length of pipe and an almost closed throttle.—Yours truly,

CONSTANT READER.

### TOURING IN ENGLAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am going for a month's tour through England, and should be grateful for any hints upon obtaining comfort at night without the excessive hotel bills specially prepared for motorists. What is the usual course adopted as to driver's food and lodging?—Yours truly,

NOVICE.

### THE COST OF OPERATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letter from "W. A. W." in the *M.C.J.* of February 10th was most interesting, but I hardly think it fair for him to include such items as registration, licence, club subscriptions and insurance under the above heading. But, even with these items removed, the cost of running in his case is excessive, being nearly 6½d. per mile. I have had my car, a 10-h.p. Turner Miesse steamer, five months, and have run just over 1,300 miles, and so far have only had to pay for fuel and lubricating oil. I have had nothing to repair and have never had a breakdown of any sort. I have not even had to look at the engine nor have I ground in a valve, either in the engine or pumps. I have not cleaned out the furnace tubes yet, but shall do so shortly.

The car is most simple to drive, and will fly up any hill in my locality with a full load. I always have four people in the car, and frequently have had five. I had my first puncture last week, caused by a sharp and thick nail. It kept the air in until I reached home, and then the tyre went flat all at once. The tyres, which are 810 by 90 Continentals, are in excellent condition, although they have been over any amount of new road metal recently. I hardly know what to put their depreciation down at, but, apart from them, my cost of running is as follows:—

140 gallons paraffin at 5½d. ...	£	s.	d.
9 " lubricating oil at 2s. 6d. ...	3	4	2
4 " petrol at 1s. 3d. ...	1	2	6
Thick motor grease, about ...	0	5	0
	0	1	6

Total ... £4 13 2

Equal to nearly 1d. per mile.—Yours truly,

W. HILL.

#### TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have pleasure in sending you particulars of the cost of running a Phoenix tri-car for comparison with that of a car:—  
Time, 78 weeks. Distance, 12,000 miles. Average length of run, 51 miles.

Petrol ...	£	s.	d.
Oil and carbide ...	9	11	7
Ignition ...	4	3	0
Tyres ...	0	8	0
Repairs and replacements ...	7	14	0
Garage and cleaning ...	12	4	4
Taxes and licences ...	2	13	6
Insurance (complete) ...	2	0	0
	6	6	0

£45 0 5

Total expenses per mile ... 9 penny.

Total expenses for week ... 11s. 6d.

Tyres, Palmers', number of punctures ... 1

Three tyres renewed and one retreaded.—Yours truly,

K. B.

#### READY FOR DEMAND.

##### TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Before Mr. Edge poses as a leader in the "Ready for Demand" movement, he might tell your readers how many British cars he is turning out per week. My concern turns out ten cars per week, and we have inserted a liquidated damages clause in all our sale agreements since Olympia. Mr. Edge has evidently overlooked the fact that a penalty is not enforceable at law, and therefore can be of no use whatever to those to whom he offers it.—Yours truly,

A BRITISH MANUFACTURER.

#### THE VALUE OF ESTIMATES.

##### TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. S. F. Edge made a public statement on the evening of February 24th in respect to the present value of cars manufactured in Great Britain.

While thoroughly in accord with Mr. Edge's endeavour to demonstrate the fact that our home manufacture of motor-cars to-day exceeds in value the imports of foreign made cars, we are entirely unable to understand how Mr. Edge has arrived at his figures. We may say for ourselves that, when approached on this subject, we declined positively to state the value of our monthly output, but nevertheless gave certain information as to the number of work-people employed and the amount of our weekly wages bill. At the time of asking for this information, Mr. Edge sent us certain particulars with regard to the output of various other companies, and we can only say that if Mr. Edge's statement has been based on an assumption from the figures as submitted to us we think—while making every possible allowance from a patriotic point of view—it would be best to accept these figures with a good deal of reserve.—Yours truly,

J. D. SIDDELEY.

#### VALVE SPRINGS.

##### TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In examining the illustrations you gave in a recent issue of the *M.C.J.* of the new 40-h.p. Crossley motor, I notice that the valve springs are of helical form instead of being spiral, as usual. At the Palace Show an attendant at one of the stands also drew my attention to the fact that the valve springs on the engine of the car he represented were helical. In this case, however, the position of the springs was reversed to that in the Crossley, the apex of the helix being at the top, whereas in the Crossley it is at the bottom. It would be interesting to know the advantages claimed for the helical valve spring over the spiral

form. Perhaps Mr. Critchley, the designer of the Crossley engine, would favour you with a few lines on the subject.—Yours truly,  
R. MOORHOUSE.

#### CHARGING ACCUMULATORS FROM SMALL DYNAMOS.

##### TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice that you are answering queries with regard to the charging of accumulators, and therefore venture to write you on the subject. I have a dynamo generating current at 100 volts, and have got my two wires (having ascertained which is + and —). How many candle-power must I have in the one circuit to charge my four-volt accumulator, which, according to instruction, should be charged at the rate of one ampere for ten hours?—Yours truly,

S. J. ROBINSON.

[To charge a four-volt accumulator which requires one ampere for the charging rate, it will be necessary to put two 16 c.p. lamps in the circuit. At 100 volt pressure a 16 c.p. lamp takes 6 amperes, and therefore two of these will give a trifle over one ampere when the 4-volt accumulator is in circuit. If 16 c.p. lamps are not available, three lamps of 8 c.p. will do; these take about 4 amperes each; or if it is preferable to charge for a long time at a slow rate, two 8 c.p. lamps will be sufficient.]

#### PISTON CLEARANCE.

##### TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you would kindly give me some information as to what is considered the best practice in the clearance between the body of the piston and the cylinder walls of a petrol engine. In other words, what should be the difference in diameter in thousandths

The 20-h.p. "Brotherhood" Car, with Limousine Body by Hooper, built for the Right Honourable Earl of Mar and Kellie.

of the piston body and the cylinder of a motor having a bore and stroke of respectively 3½ inches by 4 inches. I have been told that some manufacturers make this 4/1000 and others recommend making the piston 2/1000 smaller at the top than at the bottom on account of the higher temperature reached by the top of the piston.—Yours truly,

T. H. HALLIDAY.

[The usual amount of piston clearance is from 2/1000 to 4/1000 of an inch; some manufacturers allowing more, some less, this depending greatly on the cooling surface. The clearance on a cylinder 3½ inch bore with average cooling surface would be approximately 3/1000. The principle of the piston being larger on the one end than the other is very seldom used, most being perfectly parallel.]

HEAVY OIL.—"Steamer" writes re Lieut. Col. R. E. Crompton's lecture mentioned in the *M.C.J.* of February 24th:—"I see heavy oil mentioned at 2d., 3d., and 4d. per gallon. I would be obliged if any reader could inform me if it would be suitable for using with a Serpollet burner (old type); also where it can be bought and the smallest quantities, as I think it would interest steam users."

TYRE VULCANISING.—Mr. A. C. Duckworth writes:—"I should be glad to hear from any of your readers as to their experience with the 'Stitch-in-time' or 'Ara' portable vulcanisers."

A BRIGHTON ADVERTISER writes:—"Having had 150 answers to the advertisement you inserted last week, will you kindly say that Box 113 is now suited, and begs to thank applicants for their letters, which he has been unable to reply to individually."

AUTOMATIC ATTACHMENT FOR CARBURETTORS.—In answer to several correspondents, the address of the maker of the automatic attachment for Longuemare carburettors, illustrated in the last issue of the *M.C.J.*, is Mr. H. A. Clutterham, 19, Poplar Street, Bolton.

THE TOURIST TROPHY RACE.—Replying to J. G., St. Etienne, France, full particulars of this event can be obtained from the secretary of the Automobile Club of G.B.I., 119, Piccadilly, London, W.

## THE MANCHESTER MOTOR-CAR SHOW.

THE second of the motor-car shows with which Manchester has this season been favoured was opened in St. James's Hall on Friday of last week. It has been organised under the auspices of the Manchester Motor Trades Association, and a representative collection of the latest models of the leading makes of cars has been got together. On the stand of the Belsize Motor Car Company, Limited, Manchester, pride of place is given to a handsome Belsize 30-40-h.p. six-cylinder car, with side-entrance body. Other cars exhibited include a 12-h.p. two-cylinder and 18-24-h.p. and 30-40-h.p. four-cylinder, the principal features of which have already been dealt with in these pages. The Wolseley Tool and Motor Car Company's exhibit comprises the 6-h.p. and 12-h.p. Wolseley cars, and the 6-h.p., 12-h.p., 15-h.p. and 18-h.p. Siddeleys. The Road Carrying Company, Limited, Liverpool, are present with examples of "Unic" two and four cylinder cars and also of the 15-25-h.p. Brasier vehicle, which are attracting considerable attention. A good display of Horbick cars is made by Messrs. Horsfall and Bickham, including a 10-12-h.p. three-cylinder vehicle, a 12-16-h.p. four-cylinder landaulet, a 15-20-h.p. chassis and a 20-24-h.p. double phaeton. The Daimler Motor Company, Limited, whose new showroom and repair garage at 293, Deansgate, Manchester, is expected to be opened by the end of the present month, are showing amongst other vehicles a fine 28-36-h.p. five-seated limousine and a 30-40-h.p. "Nottingham" phaeton. The stand of Messrs. McNeil, Hutchison and Co., Limited, Manchester, is attracting considerable attention, as on it is to be seen the most powerful car in the Exhibition—the 160-h.p. Cottureau six-cylinder racer—reference to which was made in our report of the Paris Salon. Examples of the Cottureau 8-h.p. single-cylinder, 9-h.p. and 12-h.p. double-cylinder, 14-h.p. and 18-h.p. three-cylinder, and 18-h.p. and 25-h.p. four-cylinder vehicles are also shown. The Cottureau cars enjoy considerable popularity in the North, where a considerable number are in use. One of the 14-h.p. vehicles exhibited is fitted with an ambulance van body. Messrs. Newton, Bennett, and Carlisle, Limited, is another concern with a large stand, on which are shown quite a variety of makes, including Argyll, Fiat, Rover, Minerva, Enfield, Clement and Napier. Of the Argylls, the exhibit includes the 10-12-h.p., 12-14-h.p., 14-16-h.p., and 16-20-h.p. models, while the Fiats include a 24-40-h.p. chassis and a shooting brake of similar power.

Two excellent examples of the Whitlock-Aster cars are displayed by the Whitlock Automobile Company, Limited; one is an 18-22-h.p. chassis fitted with Aster four-cylinder engine and the other a 12-14-h.p. car with a well-designed double landaulet body. Both cars are of the chain-driven type. The Hollingdrake Automobile Company, Limited, Stockport, show for the first time one of the cars of the Etablissements de la Buire, for which they have secured the British agency; reference to the Buire cars, which are built at Lyons, was made in our report of the Paris Show; they are made in three sizes—15-20-h.p., 24-30-h.p., and 35-50-h.p.—the chassis on view being of 24-30-h.p. The engine has the four cylinders cast in pairs, with the valves arranged on opposite sides; the high tension magneto is advanced and retarded by means of the change-speed lever, so that the ignition is always retarded when the lever is in the neutral position. The cars are chain-driven, the differential shaft being fitted with double brakes. Ball bearings are used throughout except in the engine. Several Clement-Talbot cars are also shown by the Hollingdrake Company. Three types of Rothwell cars—16-12-h.p. double-cylinder and 12-14-h.p. and 20-24-h.p. four-cylinder—are exhibited by the Eclipse Machine Company, Limited, Oldham. Messrs. Bell Bros., of Ravensthorpe, show a well-finished 24-30-h.p. chain-driven chassis. The four-cylinder engine is provided with both accumulator and magneto ignition, both controlled by one lever on the steering wheel. A Hele-Shaw disc clutch transmits the power to the gear-box, which gives four speeds and a reverse. Ball bearings are employed throughout except on the engine. A 16-20-h.p. side entrance car, a 16-h.p. chassis, and an 8-10-h.p. two-seated car are also shown. The exhibit of the Bolton Motor Company, Limited, comprises an 8-h.p. Wolseley, a 6-h.p. Siddeley, and a 15-18-h.p. Siddeley, the latter being fitted with a handsome landaulet body. Two examples of the Coventry-Humber 10-12-h.p. four-cylinder cars are also shown. Messrs. Joseph Cockshott and Company, Limited, have a large stand, on which are to be seen the chassis of the latest Crossley 40-45-h.p. car, a 20-30-h.p. Renault, an 8-h.p. Panhard landaulet, and examples of the Clement-Talbot 8-10-h.p., 12-16-h.p. and 24-30-h.p. cars. Mr. F. Garner, Manchester, is showing specimens of the 15-h.p., 20-h.p., and 20-32-h.p. Darracqs, and of the 16-20-h.p. and 10-12-h.p. Humber, two of the latter having been built to the order of local doctors. A full range of the Humber cars is also staged by Humber, Limited. Messrs. Brown, Bros., Limited, in addition to a large display of accessories, have on view examples of the "Brown" 20-22-h.p., 18-20-h.p., and 8-10-h.p. cars. Other exhibitors of cars include Mr. R. Ramsbottom, Manchester, (Manchester); Mr. W. King Perrens, Manchester (Simms-Welbeck); Messrs. J. A. Lawton and Company (Panhard, Mercedes, Berliet and Napier); the Manchester Motor Car Company (Pipe, C.G.V. and Thames); the Northern Supply Company (Singer); Mr. F. Wilkinson (Stanley steam cars); and Mr. J. Robertson, of Rusholme (Robertson cars).

In the accessory department the exhibitors include Price's Patent Candle Company, Limited, oils and greases; Messrs. R. and J. Pullman,

Limited (non-skids); Messrs. Chas. MacIntosh and Company, Manchester (tyres); Messrs. J. Marshall and Company, Mossley (lubricants); Mr. W. Hawksley, Lytham, a new pneumatic road wheel; the Seddon Tyre Company, Manchester; Messrs. J. S. Morris and Son, Salford (lubricants); the Manchester Motor Supply Company (Michelin tyres, Parsons non-skids, and a large display of motor clothing, etc.); Messrs. David Moseley and Sons, Limited (the Moseley motor tyre); Messrs. Alfred Dunhill, Limited (everything but the motor); the London Rubber Company, Manchester (motor clothing); and the Shrewsbury and Challiner Tyre Company, Limited. The last-named concern make a large display of wheels and tyres for motor-cars and omnibuses, including the "Giant," "World," and "Road" tyres, and Challiner's patent interlocking spoke wheel. The show closes to-day (Saturday).

## A TRY FOR THE HERKOMER TROPHY.\*

By MRS. EDWARD MANVILLE.

My husband and I went in for the Trophy just for fun; we had decided to take our holiday in a motor-car in Southern Germany and the Austrian Tyrol in August of last year, and so when we heard that the Trophy was to be competed for in that very district at the very time we should be there we thought it would be fun to compete. Some friends heard, we were going, and decided to join us, so that in all we were five cars, strangely enough all Daimlers. The other four were entered by husbands of our members—Mr. Dawson, Mr. Rendle, Mr. Herdman Ash, and my husband. We only got to Munich two or three days before the competition, and we had all we could do to get our cars cleaned up and thoroughly examined before the Exhibition. We were most kindly received by Professor von Herkomer and the representatives of the Bavarian Club, who did their best to explain the tremendous number of rules of the competition to us.

We found that we must, of course, each carry a controller, that only one person would be allowed to touch the engine during the three days of reliability, and that a second man might be carried for tyres; so that filled the car, the driver, the controller, and two men. Our cars were kept in the Exhibition till six on the Friday night, and then we found we had to go forty miles to the scene of the hill climb. This was rather a nasty knock, because it meant that we should have no chance of trying the hill, and we had heard that several of the professionals had been practising on it for weeks. However, we had to trust to luck. We did not get to Kochel, the village at the foot of the hill, till nine that night, when it was raining cats and dogs, and therefore impossible to try a strange hill. We heard, however, that we might do so between six and seven the next morning, so we all turned out, but we found it impossible to really get up any speed on the hill because all the other seventy-nine competitors were trying it too, and there seemed to be an unending stream of wagons with German beer and char-a-bancs with people who were going to drink the beer going up to take their positions for the day. Of course, we saw what it was like, found that the gradient was really nothing, but the bends appalling and very frequent, and seeing that it was still pouring with rain, or rather a sort of wet mist which makes the roads worse than anything else, the going was likely to be as bad and as skiddy as it possibly could be. Everyone was searching for non-skids, the racing cars had one on each wheel. The men of our party all took upon themselves to warn me most seriously about not taking any risks. There was no necessity to go fast or tear round the corners, as, after all, the hill climb meant very little. It seemed ages going up the hill. I felt I had been driving up it for years, although it was only 3½ miles long, and only took just over seven minutes. After our climb we had to run down the hill the other side, where the cars were all collected by the Walchensee. Next morning we found that my car was fifth of all the cars, my husband's second, Mr. Rendle's third.

On Monday morning, at 3.30, we had to be in our places for the Reliability Trial. I was beginning to feel that the most delightful thing in the world was a reliability trial, when suddenly I had my first tyre trouble, and that meant I was absolutely out of the trophy. The penalty for punctures was very severe, and, besides that, there were sure to be lots of cars that would go through without any, so that it was quite certain that one loss of marks such as I had would put me out. We ran about 30 miles between controls, and had to do the distance in about an hour and a quarter or an hour and a half. The fact was that everybody went pretty fast at first, and then had to wile away time just outside the controls.

When the Trophy was run for and won, we were at liberty to explore the beautiful country lying south, which, as a matter of fact, happens to be part of the road for this year's course. The roads were most picturesque, very good surface, and beautifully engineered. Being free lances in our motor-cars, we were able to dodge about the country as we liked, and, hearing the play was on at Oberammergau, we decided to go there. We made a most romantic entry to the little village. We did not get here until about midnight. The road is very winding and mountainous, and every time we turned a corner it seemed as if the mountains shut up behind us as we went into the heart of the world, where no one could follow us.

\* From a paper read at the Ladies' A.C. on the 22nd ult.

## CLUBS AND ASSOCIATIONS.

### AERO.

THE Aero Club balloon, in charge of the Hon. C. S. Rolls, with some members of the Aero Club aboard, including the Hon. Mrs. Burrell, the fourth lady to make a balloon voyage this year, on Saturday afternoon crossed the centre of London. The party were favoured by a wind which took them directly over Westminster, St. Paul's, and the City. A maximum altitude of 4,000 feet was attained. The earth was completely lost to view, and thick snow falling, the valve was opened and the balloon brought down till the trail rope touched the ground. The journey was thus continued until the final descent in the grounds of Riven Hall, near Witham, in Essex, the residence of Mr. Bott, who, with his family, entertained the party most hospitably until their return to London by the 7.45 p.m. train. The average speed of the balloon was sixteen miles per hour.

The following have been elected to the Meteorological Committee of the Aero Club:—Sir Norman Lockyer, the Hon. C. S. Rolls, Professor Huntington, Messrs. Roger Wallace, Pollock, Dines, F.R.S., and Alexander. This committee has arranged to work in conjunction with the Royal Meteorological Society with a view to carrying on a series of balloon ascents for the purpose of the scientific research of the higher atmosphere, by means of observations and experiments, and continuous, in fact, of the work done by the late Mr. Jas. Glaisher, F.R.S., in Coxwell's balloon in the latter part of the last century.

### THE ROAD CLUB.

YET another organisation which intends to draw support from motorists is being formed. From the fact that some of the leaders of the A.C.G.B.I. are among its supporters it is not anticipated that its work will clash with any of the present societies, while it enters almost a new avenue of usefulness. The Road Club is intended to look after motorists on the road and concern itself with the ways of hotel-keepers as well as other allied matters of importance.

### YORKSHIRE.

THE committee of the Yorkshire Automobile Club has arranged for its members, and those of the affiliated branches, viz., Huddersfield, Cleveland, and Bradford, free garage upon production of their membership cards, when casually visiting Leeds, at the following garages, which are open day and night:—Mr. Rowland Winn, Albion Street; St. George's Motor Garage, Great George Street; North Street Garage, North Street; Yorkshire Mutual Garage, Woodhouse Lane; Bridge Garage, Briggate. The following are open during the day:—Mr. Atkinson, Aire Street; George and Jobling, Trinity Street; J. Wales Smith, Woodhouse. A like privilege is extended at Huddersfield, at the garage of Netherwood Bros., Albion Street.

### THE MOTOR UNION.

THE annual meeting of the Motor Union of Great Britain and Ireland will be held on Wednesday, March 28th. The Union has accepted the invitation of Messrs. Cordingley and Co. to hold the meeting at the Agricultural Hall, London, during the progress of the Exhibition. It has also been arranged that members of the Union shall be admitted free of charge to the Motor Car Exhibition on the above date, and also on the opening day of the Show, namely, Saturday, March 24th. Tickets of membership of the Union, admitting to the Exhibition and the annual meeting, can be obtained on application to the secretary, Mr. Rees Jeffereys, 1, Albemarle Street, Piccadilly, London, W., on payment of the annual subscription, which is one guinea.

### BURNLEY.

THE Burnley and District Automobile Club held their annual dinner at the Empress Hotel, Burnley. After dinner a paper was given by Mr. Douglas Mackenzie, of London, on "Transmission in Motor-cars," illustrated by photographs and diagrams.

During the course of the evening the secretary (Mr. Smith Lawson) announced the receipt of a communication from the North East Lancs. Automobile Club suggesting the advisability of an amalgamation of the two clubs. Speaking for himself, he thought that amalgamation would benefit the cause in the district. He also pointed out the possibilities there were of one united club holding sporting events, such as hill climbing competitions, non-stop runs, etc., and in addition he thought there were greater possibilities from a social aspect. Mr. Atkinson thought that there was a danger of the club losing its individuality by such amalgamation. It was ultimately decided to call a general meeting of the members to decide the

question. The proceedings terminated with a vote of thanks to Mr. Mackenzie and to Mr. T. G. Parkinson, who generously supplied the lantern for the occasion.

### BRITISH MOTOR-BOAT CLUB.

AT the forthcoming Motor-car Show at the Agricultural Hall a reception will be held on Friday, March 30th, by the British Motor-boat Club, in the Reception Hall (kindly placed at the disposal of the club by Messrs. Cordingley). The club will also have a stand in the gallery. It is expected that a large number of ladies and gentlemen will attend the reception.

The club is now appointing at various ports on the coast, and in various districts on the Thames and other rivers and estuaries, official repairers and water garages. In doing this, the aim is to endeavour to get a uniform scale of charges for members of the club, which of course would be a reduction to that charged to the public at large. Under this scheme the firms appointed should also greatly

Sir David Salomons, a Pioneer of the Automobile Movement.  
From a Caricature [in *Le Chauffeur*.]

benefit, as all members would naturally, when in the district, go to the firm appointed by the club for their supplies, housing the boat, etc. The same system is also being carried out with regard to hotels at various seaports on the Thames. Applications for appointments should be made to the secretary, British Motor-boat Club, Craven Hotel Charing Cross, London, W.C.

### BLACKHEATH.

THE Blackheath Automobile Club has now a membership of fifty-six, and the annual report is a record of good work done in the locality as well as in collecting evidence for the Commission. Several social gatherings were held, and a joint meet with the Kent Club was most successful.

The annual general meeting and dinner was held at the Art Club, Blackheath, on Friday, the 23rd ult. Col. Holden, R.A., in the chair. Fifty members and guests were present, including Professor Carlton J. Lambert, M.A., Messrs. R. W. Annison, L. Beadle, H. Beadle, P. Beadle, J. H. Bowden, Tom Browne, W. F. Butcher, H. A. Cunis, A. W. Dover, H. J. Fisher, O. V. Flather, A. G. Fraser, E. Fraser, J. Strickland Goodall, M.B., A. Jackson, W. H. Kendall, Leslie, C. Lambert, Ralph Lucas, T. Marshall, F. G. Nichols, Septimus Nickells, F. Palmer, J. T. Prestige, junr., T. E. Quick, J. Horace Reeves, A. Roberts, Clarence Souhes, E. W. Stabb-Johnson, Fred. Thorne, W. L. Veitch, A. W. Warmsley, W. Whiteway, and G. Willis. The following officers were elected:—President, Lord Hugh Cecil; vice-presidents, Col. H. C. L. Holden, R.A., F.R.S., Prof. Carlton J. Lambert, M.A., Hon. Arthur Stanley, M.P.; committee, Messrs. H. Cunis, J. Strickland Goodall, M.B., Arthur Jackson, W. Stabb-Johnson, Ralph Lucas, T. Marshall, J. T. Prestige, junr., Fred Thorne; hon.

treasurer, Mr. H. J. Fisher; captain, Mr. Leonard Beadle; auditors, Messrs. Ralph Lucas and J. T. Prestige, jun.; delegates to Motor Union, Messrs. H. A. Cunis and hon. sec.; hon. sec., Mr. Alfred Roberts.

A vote of thanks was passed to the retiring officers, Messrs. Leslie C. Lambert, Harold Norfolk, and Stanley Norfolk, which was suitably acknowledged by Mr. Leslie C. Lambert; and a vote of thanks was passed to the officers who acted last year, which Mr. H. A. Cunis, chairman of committee, acknowledged.

Following the business a musical programme was much enjoyed. The *bonne bouche* of the evening was the lightning sketches which Mr. Tom Browne, B.I. (member of the club), made, depicting the features of "The Man who does not like Motor-Cars"; "Keep on his right side" (head of a constable), and "The Motor Race," which were extremely clever character studies, and their rapid delineation causing great interest to the onlookers.

### ABERDEEN MECHANICAL SOCIETY.

At a meeting of the Aberdeen Mechanical Society, held in Gordon's College, Aberdeen, on the 23rd ult., Mr. P. N. Shinnie delivered an interesting lecture on "Automobiles—Petrol Motors." There was a very large audience, and the chair was occupied by Mr. Samuel Milne, president of the society. Mr. Shinnie described the mechanism of the petrol motor, entering in detail into a discussion of the methods of constructing the various parts. He also described and commented upon the various types of automobiles on the market, showing where they differed from each other, and pointing out the specialities of construction which characterise the different makes. The lecturer also gave some interesting information as to the cost of running automobiles. His address was listened to with great attention and interest, and at its close a cordial vote of thanks was awarded to the lecturer.

### LIVERPOOL ENGINEERING SOCIETY.

At a meeting of this society, Mr. E. A. Rosenheim, B.Sc., has read a paper on "Motor-car Practice in 1905," which will be discussed at a meeting to be held at the Royal Institution, Liverpool, on Wednesday next. In his paper the writer gave a comprehensive review of the industry and the leading principles of modern practice.

FOR the Auto Cycle Club's run from Land's End to John o' Groats one quad-car, two tri-cars and six motor-cycles have been entered.

THE Automobile Association's scouts will, in future, confine their protection only to members of that body.

THE discussion on Col. Crompton's paper on "Some Unsolved Problems in Motor-engineering" will be resumed at the United Service Institution, Whitehall, on the 7th inst.

A SUGGESTION is being made for an automobile club for Kensington, and resident motorists likely to be interested in such a development are invited to communicate with Mr. J. H. Reeves, 2, Penywern Road, Earl's Court, S.W.

MR. G. A. GIBBS, M.P., and Sir Herbert Ashman, J.P., have been elected vice-presidents of the Bristol and Gloucestershire Automobile Club, which has now a membership of 100.

THE Earl of Caledon and Sir Frederick Harrison have been elected to membership of the A.C.G.B.I.

ON June 16th the annual hill climb of the Midland Automobile Club will be held at Shelsley Walsh.

MR. H. A. COOKE, 274, High Street, Cheltenham, is the honorary secretary of the newly-formed motor-cycle club for that town and district.

THE Essex Motor Club will have an Easter tour to Bournemouth.

THE local honorary secretaries for the Lincolnshire Automobile Club, to look after the interests of the organisation in their respective neighbourhoods, are Dr. Passmore, Gainsborough; Mr. C. G. Parker, Grantham; Dr. Miller, Boston; Dr. Gilpin, Bourne, and Mr. Spencer, Grimsby.

A CIRCULAR of "the advantages enjoyed by members of the Sheffield Automobile Club" has been issued. It might be usefully imitated by other provincial organisations.

THE British Motor Boat Club held at its headquarters, Craven Hotel, Charing Cross, on Thursday of last week, a successful informal dinner, after which Lieut. Windham, R.N., read an interesting paper on the "Practical Handling of Motor Boats," which was illustrated by some lantern slides. Amongst those present were:—Capt. Hamilton (Chief of the Metropolitan Fire Brigade), Lieut. Windham, Capt. W. E. Owen, Messrs. N. B. Kenealy, J. M. Gorham, R. S. Fraser, O. B. Colls, Mackworth B. Praed, L. Appleton, J. T. Virgo-Vincent, S. Cutler, F. B. East, G. Tagg, Seaton Edge, W. E. Hearman, K. O. Searle, Rev. A. C. Hervey, T. F. Woodfine, J. Wood, F. C. Blake, A. Harden, A. G. Fentiman, and the secretary, R. B. Robinson.

THE general committee of the Motor Union of Great Britain and Ireland has added the following members to its list of vice-presidents:—The Duke of Beaufort, Earl Cairns, Lord Wenlock, Lord Langattock, Sir Charles Seely, Bart., M.P., Sir George Livesey, and Mr. N. Micklem, K.C., M.P.

### ROAD REPORTS.

LONDON TO FOLKESTONE.—The road from London to Folkestone is to be clearly indicated by a system of finger posts erected by the Roads Improvement Association, assisted by Mr. H. P. Maybury, county surveyor for Kent.

HALE.—Dr. Rothwell, medical officer of health for Hale (Cheshire) states that during the summer months an experiment with regard to dust prevention was made on Ashley Road, the road over which most traffic passes. This experiment consisted in distributing over the surface a thin layer of hot liquid tar, and scattering over this a mixture of sand and lime. There is no doubt that much benefit was derived by this means and even to-day the surface of the road is drier and cleaner than that of the adjoining roads. This, or other satisfactory methods, ought to be carried out on all roads over which there is any quantity of traffic, for doubtless much disease must be dependent on the dissemination of dust.

UTTOKETER.—Several of the roads about Uttoketer have been under repair, including portions of the highway to Newcastle and Ellastone.

COUNTRY ROADS.—Speaking on Tuesday at the Institution of Civil Engineers on "Country Roads for Modern Traffic," Mr. J. E. Blackwall suggested the gradual alteration of existing main roads into twin roads, one for heavy traffic and one for light, separated by a fence and a footpath, which would most probably result in a saving in regard to the cost of maintenance in the long run. The minimum width of the two roads and footpath together should be at least 46 ft. between fences, 21 ft. for each road and 4 ft. for the footpath. The two roads would converge into one at the entrance of a village or any confined space. The cost of conversion of a road from 30 ft. to 46 ft. wide, providing that the extra land required was given by the adjoining farmer for the good of the public, would be about £1 1s. 7d. per lineal yard, or about £1,900 per mile.

### MOTOR PUBLIC SERVICES.

THE Silsden Motor Omnibus Company, Limited, has been registered with a capital of £2,500.

THE British Motor Omnibus Company, Limited, has been registered with a capital of £100.

THE directors of the Blackpool and Fleetwood Tramroad Company have formed a company to take over the motor-car service of the old Fleetwood Motor Passenger Carrying Company, Limited. Motor launches are also to be provided for passengers from Knott End to Fleetwood.

THE London and Counties Motor Omnibus Company, Limited, has been registered with a capital of £100.

PROFESSOR SKEAT suggests the name of "Buzzer" for the motor-omnibus.

THE "Arrow" motor-omnibuses which have been running between Putney and Brondesbury have been taken off that route, in order to swell the number running between Putney and Waterloo, where the supply is unequal to the demand.

### CASES AGAINST MOTORISTS.

Place.	Summoned for	Result.
Cleckheaton ...	No licence	£5, etc.
Halstead ...	Reckless driving	Dismissed.
Bow Street ...	Exceeding ten miles an hour in St. James's Park	£5, etc.
Croydon ...	Excessive speed	£10, etc.
Kingston ...	Exceeding regulation speed	£5, etc.
Halstead ...	Reckless driving	Dismissed.
Warwick ...	Dangerous speed	£5, etc.
Wokingham ...	Dangerous driving	£1, etc.

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

## COMMENTS.

### Unwarrantable Interference with the Subject.

AGREEMENTS in restraint of trade have never been popular in this country, nor have efforts to prevent individuals or associations carrying out policies which are in accordance with British ideas of equity. Such schemes have been tried in various industries with failure at the end; and there is little doubt that attempts now in progress to place a ring around the automobile business, so that it shall revolve in a very small circle, are doomed to ultimate discomfiture. Whether any section of men are likely to submit to the dictation of a few for long is not a matter of doubt—it is impossible. Hence, at the present juncture, when movements and counter-movements seem to be the order of the day, everyone in the industry will do wisely to hold aloof from complications that are likely to ultimately prove restrictive, irksome, and unprofitable. Fair play all round is the motto of many of the leading firms in the automobile industry, and this is an attitude that the general motoring community will appreciate.

### Motor-Car Legislation.

It is now generally accepted that there will be no fresh legislation with regard to automobiles this year, and that the Act under which motorists live and move will be included in the Expiring Laws Continuance Bill at the end of the Parliamentary session of 1906, thus averting any change till the end of 1907. Even if the Royal Commissioners were prepared with their recommendations, it is doubtful if they would have a chance of consideration. Already the Government have expressed their intention of fulfilling the programme indicated in the King's Speech, so that the work to be done is sufficiently heavy to prevent the inclusion of further measures. But delay will probably be to the advantage of the motorist and, consequently, the public.

### Sheffield Common Sense.

THE opening of the motor-car show at Sheffield was made interesting by a thoughtful speech from the Lord Mayor of the town, who, referring to the private use of automobiles, said that he had been driven about a good deal in cars belonging to friends. In the experience he had had he did not see that it mattered a great deal if they ran at thirty or even forty miles an hour where there was little traffic, and where no harm could be done by getting over the ground quickly. The feeling, which he was glad to say was now dying away, but which had certainly been displayed, against the motor-car was due more than anything else to the action of drivers who paid no attention to traffic when they were passing along the roads. He had seen a chauffeur drive past restive horses without any slackening of speed. This was the kind of thing which had brought about the blame upon automobile driving, and his impression was that if drivers of cars did have regard for traffic as they were passing, and did not drive too quickly, or even up to

the legalised standard, when passing horses, then there would be little reproach against them. He did not think there ought to be police interference where there was little traffic, and the attention should be paid to those places where interference with traffic was caused if the speed of cars was too great. There was no reason why they should not run over twenty miles an hour on certain roads, and at the same time there were places where twenty miles an hour was much too great a speed.

### London Motor-'Buses.

It may be of service to designers of motor-'buses to know that worry and possible loss may be saved (so far as the use of vehicles on London streets is concerned) by taking the Commissioner of Police into confidence before the actual work of construction is begun. The officials of Scotland Yard are particularly solicitous as to the comfort of householders in streets through which such vehicles are intended to travel; hence their refusal to licence several 'buses recently submitted on account of excessive weight and consequent vibration. Under these circumstances makers of 'buses of higher power than those now running would do well to deposit with the Commissioner drawings of suggested chassis for his consideration, together with the approximate weight. Then the question of horse-power, weight, and design, with a view to freedom from vibration, will be taken into account in considering the chassis both for weight and horse-power. Some decision would be come to enabling them to go on with the construction of the 'buses, without fearing that at the last moment the vehicles would be thrown back on the hands of the designers.

### The Scottish Trial.

FROM all we hear, the Scottish Reliability Trials will be an even greater success than was the case last year. The season at which they will be held is more conducive to the attendance of spectators than the month of May, when snow lingers on the hills in the Highlands, and the air is distinctly chilly. With reference to the route proposed, we understand that the north bank of Loch Tay will probably be selected, the road on the south side being regarded as out of the question—a piece of comfort to competitors.

### The Tyre Trials.

THURSDAY of last week saw the first road run of these trials, when the three cars fitted, two of them with standard Collier tyres, and the third with an experimental beaded edge tyre, entered by the Collier Tyre Company, made the journey to Northleach and back *via* High Wycombe and Oxford. There was promise of rain when the start was made in the early morning, but nothing much came of it. The roads were, however, for the most part wet, and in places rather greasy. Parsons non-skids were therefore put on the 28-h.p. Daimler and the 20-h.p. Dennis. The ascent of Dashwood Hill presented no difficulties, and the journey was made without interruptions to Northleach and back to Witney, where the cars halted

while their passengers lunched. The afternoon was also only remarkable for the way everything ran. There were no tyre troubles. The Dennis car which is under observation was unlucky to lose its "non-stop" record for the day because of a choked petrol filter; the Vulcan speedometer had to be disconnected through a weak bracket; and the Metallic Mirrors, Limited, tail light ceased to burn owing to deficient air supply. On the following day the run was to Dunchurch and back. This was marked by no untoward incidents to the various entries; tyres, lamps, speedometers and car all did their work correctly, with the exception of the Worsnop tail light, which went out owing to vibration, and one of the Worsnop head lights, which got its feed pipe choked in some way. On Saturday the road was to Peterborough, when again tyres, car, speedometers and lamps came through successfully, with the exception that the Warner speedometer driving gear required adjustment on the road. The distance covered up to Saturday night was 495½ miles, and on Monday the longest and hardest route undertaken thus far was traversed, viz., to the foot of Sunrising Hill, *via* Tring, Aylesbury and Banbury.

The Hon. H. L. Bruce and Mr. Colin Defries on the former's 40-h.p. De Dietrich. Mr. Bruce has already covered several thousand miles on the car without a single involuntary stop, except for a few punctures.

(Hazel, Bournemouth.

### The Motor Exhibition.

THE fact that nearly 300 individual firms will be exhibiting at Cordingley's Motor Car Exhibition at the Agricultural Hall, London, which opens on the 24th inst., proves the advance made by the automobile industry during the last few years. It also shows the position which this annual event has attained in the motor-car world. In an analysis of the Agricultural Hall Exhibition last year Mr. H. Hewitt Griffin said, "Mr. Cordingley is to be congratulated, as he beat the powerful combination in the number of firms showing cars, and was thirty-eight ahead on the exhibitors supporting him." This year many new vehicles will be on view, and from the preliminary list of exhibitors it is evident that success is assured. A notable feature of the 1906 display is the support accorded by several of the leading automobile associations. The Ladies' Automobile Club will have a reception; the Motor Union will hold its annual meeting; a reunion of the Automobile Association will take place; the Cycle and Allied Trades Association has convened a gathering of members; the Automobile Mutual Protection Association, the Motor Van and Wagon Users' Association, the Aero Club, and the British Motor Boat Club are also arranging conferences and meetings, thus making the Agricultural Hall the centre of a really important Motor Week, from the 24th to the 31st inst. This list of societies practically

comprehends the whole of the automobile world, the Motor Union alone having a membership approaching 10,000.

### Attacks on Motorists.

NOT often do we hear nowadays of the attacks on motorists such as were common four or five years ago. But an instance has just occurred in Scotland, where in the Elgin Sheriff Court a farmer has been charged with assaulting a motor-car driver in the employment of a solicitor. It appeared that the accused, while passing the motor-car in his trap, lashed his whip and struck the driver. He was convicted on evidence, and fined 20s., with the alternative of seven days' imprisonment. We recently commented on an almost identical instance occurring in Ireland, and would congratulate the motorists on the results of their proceedings in both cases.

### Northern 'Bus Advance.

ENTERPRISE with regard to the motor-'bus is not to be limited to the southern counties, and in many of the popular holiday resorts its advent during the coming summer will divert the course of things. Lumbering coaches, ancient brakes, and char-a-bancs of antiquated appearance have had their day and will shortly be consigned to the memories of the past. At Manchester there are indications of the newer order of loco motion on common roads, some experimental motor-'bus trips having been made to Cheadle, Hale, Flixton, and other places. A scheme is developing for running fifty motor-'buses to residential centres in Lancashire, Derbyshire, and Cheshire, working from Cottonopolis as a base, and the network of routes radiating as far afield as Wigan, Chester, Knutsford, Crewe, and Buxton. Should the weather prove reasonable and seasonable during the summer, financial success should follow good organisation.

### Competing with Petrol.

WHILE not prepared to join in the cry that has been raised in some circles as to the possibility of a rise in the price of petrol to a point beyond profit to the user, we would encourage any movement to make possible the utilisation of some other fuel, such as alcohol, in connection with automobiles. Colonel Crompton has been advocating a study of the possibilities of the steam motor, partly with a view to preventing a monopoly for petrol, and Mr. W. E. Scarritt, the ex-president of the Automobile Club of America, has been urging that motorists should make appeals to their congressional representatives to take steps to remove the tax from alcohol used for power or for manufacturing purposes. He estimates that there are, approximately, 70,000 motor-cars in use in the United States, and that the increased demand for gasoline during the last five years has led to its price being doubled. Hence the point of the agitation he is inciting.

### The Press and Motorism.

ONE of the most remarkable developments in daily journalism has been the attention bestowed upon motoring, and hardly a journal of repute now ignores the motor-car. Practically all the great dailies have their motoring column—of varied interest and utility. The halfpenny journals were the first to recognise the possibilities of motoring in interesting readers. Now the more staid organs of opinion have both their literary and advertising motor columns. Once a month the "Times" deals with motoring in a notable way, while its engineering supplement is open for the discussion of problems of a more technical nature connected with the industry. The "Morning Post" continues its valuable resumé every week, dealing conscientiously and thoroughly with all branches of the movement. In the "Standard" we have a daily note-book of current interest; the "Daily Telegraph" frequently has useful comments; the "Morning Leader" writes fearlessly on matters of trade importance; the new "Tribune" recognised the motor-car

from the start ; and now the "Daily Chronicle" has fallen into line, and last Saturday commenced a series of motor notes that promise well. All this is comforting in comparison with the record of accidents and mishaps in which the London press was wont to delight not so many years ago.

**Lt.-Col.  
Mark Mayhew.**

LT.-COL. MARK MAYHEW has been so long and prominently associated with the automobile movement that many of our readers will at once recognise his features in the photograph reproduced herewith. Not only was he concerned

with the early work of the Automobile Club, but as the head of a leading industrial firm in the south of London did much to

that those concerned in this form of sport must be a little more active in forwarding their interests. In any case individual motor-cyclists will be well advised in joining existing clubs which have been formed to bring them together for technical knowledge as well as social intercourse.

**L'Entente  
Cordiale.**

FURTHER evidence of the fraternal feeling now existing between France and England is afforded by the acceptance by the Automobile Club de France of an invitation for members to visit the Exhibition at the Agricultural Hall, London.

It has been the case at the previous Exhibitions of the series, that the attendance of Continental visitors is as much a feature of

Lieut.-Col. and Mrs. Mark Mayhew on their 22-28-h.p. Crossley Car.

further the popularity of heavy motor traffic in days when commercial houses were somewhat dilatory in realising the advantages of the new locomotion over ordinary. Latterly Lt.-Col. Mayhew has become identified with the Motor Volunteer Corps, of which he was the founder.

**Motor Cycling.**

MOTOR-CYCLISTS are preparing for the summer delights, and already some of the northern organisations are inciting others to activity. At the annual dinner of the Sheffield and Hallamshire Motor-Cycle Club, Mr. J. R. Kelley, the president of the Leeds Motor-Cycle Club, urged the formation of a Northern Union of Motor Cycle Clubs, and there is a feeling

Cordingley's Show as are the English visitors at the Paris Salon. This fact is of special interest to the many British firms who thus secure the opportunity of extending their influence among automobilists abroad.

**An Efficient  
Road Service.**

It will be of general interest to motorists, particularly those using the southern roads, to know of an important development of the work of the Automobile Association. Their patrols are now being trained in vulcanizing work, and will carry spare patches, etc., so as to be able to assist members of the Association who may be stranded on the road "miles from anywhere." In addition, all the men are to be

instructed as to the location of the garages, repair works, doctors, etc., so that in the event of mishap information of real utility will be readily available. The new departure in no way affects the declared policy of the Association, inasmuch as the necessary restraint will still be exercised upon all and sundry offenders in respect of dangerous or inconsiderate speeding. In this programme of practical road supervision no encroachment is made upon the work of any existing organisation. The A.A. patrol will be an adjunct to and not a substitute for the local repair shops, and in addition to the experiments now being made with a device by which members of the Association will be known to its scouts, arrangements are being made that firms in the motor-car industry will enjoy the benefits of the work as freely as they are assisting the movement.

#### Police Nescience.

It might be well if the police throughout the country were instructed in the elementary clauses of the law which they are called upon to enforce. A correspondent calls attention to an amusing instance of the nescience of the police in a southern district. Motoring in Portsmouth, a reader was asked by a constable why the front number was not illuminated. This particular ornament of the force had apparently been so engrossed in watching rear numbers that he had an idea those on the front of the car should be equally illuminated. Fortunately nothing serious happened, but the incident is illustrative of the ignorance of those who are responsible for the administration of the law in many parts of the country.

#### A Practical Judge.

The novel spectacle of a judge, accompanied by counsel in wigs and gowns, and a jury critically watching a slowly-travelling steam-lorry was seen outside Brompton County Court the other day. It arose through the practical suggestion of Judge Selfe that the jury might form their own opinion as to whether the vehicle, which belonged to a firm of brewers, was a nuisance and likely to frighten horses in the street. In the end the jury found for the defendant brewers. The suggestion implied in the incident is one that might well be adopted by magistrates elsewhere, especially in testing the ability of policemen to estimate the speed of motor-cars.

#### Excessive Road Watering.

UTTERLY regardless of the comfort, or the safety, of some of those who constitute the lighter classes of traffic, some of the local authorities incline to the excessive watering of streets. Last year a cyclist on the road from Upper Branksome to Branksome had a side-slip on a stretch of road which had been excessively watered with salt water. He slipped and sustained injury. Reporting the matter to the C.T.C., they took the opinion of Earl Russell on the point as to whether a local authority is justified in excessively watering a road to the danger of the cycling public, and obtained from him a decided reply that a local authority has no power to exercise its rights so as to create an obstruction. Meanwhile the cyclist had claimed compensation to the extent of £2 2s. from the Branksome Urban District Council, which claim they declined to entertain. Subsequently the Council area became merged in that of the Poole Town Council, against which a summons was taken out. Ten days before the case was to have been heard the Poole Town Council paid the amount claimed, with costs. The resolve of the defendants to dispose of the claim made against them without going into court is in a sense disappointing, for it would have been interesting to have seen the matter fought to a finish. As it is, however, the principle that local authorities may not flood their roads with water in such a way as to endanger the life and limbs of any class of road users has been established—a point of value to motorists in common with all users of the roads.

#### Canadian Prospects.

EITHER automobile makers are too busy on immediate work, or they have yet to thoroughly realise the advice of the Prince of Wales to "Wake up, England!" for when Mr. E. H. Turnbull promised to give the members of the Automobile Club the benefit of his experience in Canada only a comparatively few of those engaged in business went forth to hear him. Possibly more might have been said as to the requirements of the Dominion with regard to cars and the types likely to prove acceptable. The main point of the lecture was with regard to the exhibitions to be held in Canada this year, at which the Daimler, Argyll, Humber, Rex, and other British vehicles will be represented. We trust that the events to take place at Toronto and Montreal next month will do something for the motor trades of Canada and also of this country.

#### The Weather.

At length the promise of fair weather has come and the genial conditions prevailing last week-end promise to give an impetus to the selling season. The outlook is all the more hopeful as no violent changes had occurred up to the time of going to press. In such a business as that associated with the automobile pleasant weather is a necessary factor in success, and the early coming of genial conditions should encourage exhibitors at the forthcoming Show.

MESSRS. A. DARRACQ AND CO., LIMITED, have removed their headquarters to Walnut Tree Walk, Kennington Road, S.E., where all communications should now be addressed.

To the Beaufort brake for India illustrated in our last issue heavy section Palmer cord tyres are fitted, the local agents regarding these as eminently suitable for the severe conditions obtaining there.

ON Wednesday morning a four-wheel cab coming out of Jermyn Street into Regent Street, London, was knocked over by a motor-bus. The driver was severely injured, and taken to the hospital unconscious.

THE Great Eastern Railway Company have commenced their motor-omnibus services between Chelmsford and Writtle, Great Baddow and Great Waltham. On Monday next they will begin a service of motor-buses between Colchester and West Mersea, leaving the former place at 8.10 a.m., 10.55 a.m., and 5.40 p.m. every day.

THE Gratz Patent and Engineering Syndicate, Limited, have brought out a new current distributor, which will be among the novelties shown by the company at the Motor Car Show at the Agricultural Hall, where they will also exhibit their new accumulator and the Gratz speed indicator, which has done well in the trials now proceeding under the auspices of the A.C.G.B.I.

WHILE Sir Thomas Lipton was at Castelsarsasin, France, recently, a dog-cart ran into his motor-car. The gendarmes who appeared on the scene seized the car and escorted Sir Thomas and his companions to the police station. Sir Thomas was detained for over two hours while a charge was formulated, and was interrogated by the Prefect. In the end, however, the prosecutor was propitiated with a present of money, and the matter was amicably settled.

THE Enfield Autocar Company, Limited, offers for subscription at par 100,000 shares of £1 each. The company has been formed for the purpose of purchasing, carrying on, and extending the business of the motor-car department of the Enfield Cycle Company, Limited. The capital is £150,000 divided into £1 shares. The price to be paid to the vendor company is £31,162, and the directors are Mr. A. Eadie (chairman), Lord Ernest Seymour, Messrs. G. H. Cartland, T. Evans, R. W. Smith, and E. H. Lancaster. M. W. Guillon, late works manager of the Fabrique Nationale of Liege, will be the works' manager.

## THE MOTORIST'S SPRING CLEANING.

THE approach of spring, which is the signal for a burst of unappreciated activity upon the part of our friends the poets, and which means to them a return of the flowers and the birds, is none the less interesting, though of less romantic concern, to the motorist. To him the year is divided into two parts, namely, the season when one can use his vehicle with pleasure and the season when one cannot, although there are motorists to whom a long drive in winter is a source of joy; and the significance of spring to him is that it ushers in the former long-sighed-for period. Just as spring cleaning is now the order of the day in domestic circles, the motorist may well indulge in a complete overhauling of his car at the present time preparatory to its season's work.

There are usually quite a number of minor defects about a motor-vehicle, which are tolerated as long as they do not materially

look about for room to locate a multiple oiler and its necessary piping. If water circulation has proved unsatisfactory in past seasons one may be led to seek relief, in this direction, by adding a new circulating pump and radiator. And then there is the matter of painting. If the vehicle has seen hard service during the past season, the probability is that it is needed. One should be sure to wait until every bit of mechanical work about the carriage is completed, beyond any possibility of resumption, before any painting or varnishing is done. It requires only a few slips of the mechanic's wrench to chip off the shining new coat to a state of shabbiness, and the prints of black hands upon fresh paint are not ornamental.

In case there are no special repairs needed or improvements to be added, the spring cleaning resolves itself into a thorough course of inspection, cleaning and readjustment covering all parts of the vehicle. One is always interested to see in what condition tyres will prove to be, as it is a matter that affects the pocket-book

A Public Motor-Car Service in Cairo.

In our last issue we mentioned that the Compagnie des Omnibus du Caire had recently inaugurated some trials with motor-omnibuses. The above illustration shows one of the vehicles loading up for a run to the Pyramids, a distance of about nine miles.

interfere with its operation, and which are not serious enough to warrant the loss of use which their cure, in the busy season, would entail. Now is the proper time to look after these with such a degree of thoroughness that their recurrence during the coming season may be next to impossible. If the car has shown any bad habits, it is a favourable opportunity to institute an investigation for the purpose of locating the trouble and applying a suitable remedy. It may be, too, that it will be found upon inquiry that the manufacturers have brought out some useful improvement or attachment, which it may be practicable to instal upon the vehicle, and thus, to a certain extent, bring it up to date. The better class of manufacturers will be found ready to give an old customer the benefit of any such new "wrinkle" at a reasonable price, to the end he may remain upon the satisfied list.

It may be found that the manufacturers have improved their carburettor to such an extent that a change may be warranted. Perchance the owner is weary of filling and regulating the feed of a half-dozen or more separate oil cups, in which case he may

most deeply. The tyres should, of course, have been relieved of the weight of the vehicle during the period of disuse. They should now be pumped up, and, if any one does not hold air properly and the fault is not in a leaky valve, it should be taken off and examined, while any holes in the outer covers should be filled up. The bearings of the wheels should be thoroughly cleaned, readjusted if there is need, and packed with grease or heavy lubricant. It is well to bear in mind that the steering gear and brakes are the two special parts of an automobile upon the integrity of which human life depends, and these portions should be given a special inspection. Backlash or lost motion in the steering gear is a most annoying thing, and one which inevitably results from long usage. If there has been any nut or screw upon any part of the steering gear that has shown a tendency to work loose, do not tolerate it a moment longer, and do not trust any nut without a split pin to hold it. The brakes, too, are entitled to a really painstaking examination. There will be a certain amount of stretch of the pull rods and wear of the

braking surfaces to be attended to at the end of a season's use. There should be no "drag" of the brake shoes or straps allowed when the brakes are supposed to be out of action. The utmost care as to the security of all nuts will be well expended here.

Upon almost every car there are usually one or more nuts which seem to have a congenital tendency to work loose, as they are found in that condition at almost every inspection of the vehicle. It is a favourable time to deal finally with these bad nuts so that they may never again figure in the trouble account. One can deal with such nuts either by providing split pins, lock nuts or set screws, or even by the brutal recourse of heading over the end of the stud. For large nuts that are otherwise incorrigible the application of a set-screw will prove a certain cure. If the car is chain driven, it is well to take off the chains and soak them in paraffin in order to clean them thoroughly. If soaked in a pan having a false bottom of wire netting and the liquid is agitated from time to time, the dirt will collect below the false bottom and leave the chains quite free from grit. The paraffin may then be drained off and the chain given a bath in warm melted tallow, with which has been mixed some graphite of the finest grade, it being allowed to remain in this until the chains and grease are one solid mass. A chain should be examined for stretch, and, if enough wear is found to cause it to run seriously out of pitch, it may be

particle of sediment should be washed out with petrol in order to make a fresh start. The rubber connections of the cooling-system may need renewal, as they deteriorate under the action of hot water, and tanks or radiators may have developed slight leaks which demand treatment.

If the engine has been addicted to any bad habits now is the time to try and reform them. There may have been an annoying knock, which can be disposed of, or perhaps the compression, which is the very life and spirit of a petrol motor, may have become weak. The old oil should be drawn off from the engine crank-case and the reciprocating parts given a bath of paraffin. The bearing of the connecting rod on the crank-shaft should be carefully examined to see if there is any backlash which might give rise to a "knock." If so, it should be taken up by an adjustment of the brasses, at the same time assuring oneself that the brasses are left in a perfectly secure condition; for a loose connecting rod is a very destructive thing. The crank-shaft bearings and the bearing of the connecting rod in the piston should be looked after as regards their adjustment and the efficiency of their lubrication.

Both the exhaust and the inlet valve should be carefully ground into their seats by the use of D. 'vies' or other good emery, if there is the slightest suspicion against their tightness. Care

A trio of Orion Omnibuses which have run continuously for the Victoria Omnibus Co. for respectively 27, 25, and 13 weeks. The total mileage for the three cars is 50,751, which gives an average of 109 miles per day after allowing for stoppages for overhauling.

good policy to discard it, and invest in a new one. If the chain is very much worn the probabilities are that the outlines of the sprocket teeth are badly out of shape, in which case it may be best to secure new sprockets, for it is just as bad judgment to put new chains on old sprockets as "new wine in old bottles." If sprockets are to be changed, it is well to consider whether any other "gear" would be preferable. Automobiles are generally geared to meet average conditions, but if a particular car is to be used in a very hilly country, where the roads are bad, it may be good policy, when a change is to be made, to add a tooth or two to the rear sprocket and thus secure a gear better adapted to the conditions; while, if the car is operated in a level country, and a little more speed is desired, a tooth or two may be dropped from the rear sprocket.

Despite the utmost precautions, a considerable amount of dirt and moisture may have collected in the carburettor and the petrol tank. If any trouble on this account is feared, the carburettor should be disconnected and taken entirely to pieces, and all parts and passages should be thoroughly cleaned. If the needle valve which is operated by the float does not shut off properly it should be ground into its seat until tight. Every drop of liquid should be drained out of the tank and every

should be taken to see that the jacket water does not leak into the cylinder on account of the cylinder head joint, if such exists, having given out. A general examination as to the lubrication of all parts should be made. Oil cups should be removed and cleaned, so that their sight feeds may be visible, and all oil-ways should be demonstrated to be clear. The ignition mechanism deserves its share of attention. If any trouble has ever been experienced from broken wires or short circuits this is a good opportunity to re-wire the car. In the general overhauling the friction-clutch should not be overlooked, but should be adjusted carefully.

If the automobilist's spring cleaning and renovating is well done, it will bear abundant and satisfactory fruit in a smoothness of operation and a comparative freedom from trouble during the coming season, and will save many fold the time and trouble spent on it.

THE registered office of the Milano Motors, Limited, is at 92, Gloucester Road, S.W. One object of this company is to acquire the sole agency in this country for the Orel car. The first directors are Messrs. C. Manuel, J. A. Wild and F. H. Baker.

## SOME CURRENT TOPICS.

### The Tendency of Motor-Car Design in Germany.

An interesting statistical record of the details of the cars exhibited at the recent motor-car exhibition in Berlin has been prepared by the "Allgemeine Automobil Zeitung," from which it would seem that the tendency towards the adoption of separately-cast cylinders is not as yet very marked in Germany, as only 18.6 per cent. of the cars on view were so arranged. On the other hand, 80.4 per cent. had engines with the cylinders cast in pairs, the odd 1 per cent. being a motor with all four cylinders in one casting. The mechanically-actuated valve has almost entirely superseded the suction type, which has only 6.2 per cent. to its credit, as against 93.8 per cent. to that of the M.O.V. As regards the great question of transmission, chain drive still holds the leading position with 51 per cent., as against 49 per cent. for the cardan shaft variety. The popularity of the internal expanding type of brake for the rear road wheels is shown by the fact that these were found on 95 per cent. of the cars, only 5 per cent. having contracting brakes. As in France and this country, magneto ignition, especially the high tension, is making rapid progress in Germany, the proportion of this system to that by accumulators and coils being 61 per cent. to 39 per cent.

### Future Developments in Motor Design.

It is always hazardous to touch upon the developments which the future may bring forth. Although the four-cycle petrol motor is supreme in the field to-day, it is by no means certain that the last word has been said in regard to internal combustion engines. The two-stroke cycle offers so great advantages in point of simplicity that it would be by no means surprising if a valveless type of engine for automobile use, operating on the two-stroke cycle, should become widely adopted in the future. Already several cars fitted with this type of motor have been brought out, notably by the Oldsmobile Company in America, and by the Valveless Motor Company in this country; and although these may perhaps be looked upon in the light of experiments, yet it clearly shows that finality has not yet been reached. Another change which it is not unlikely will be effected in the near future is that of the use of other fuel than petroleum spirit. One hesitates, too, in accepting the present methods of ignition as final, especially as during the operation of an internal combustion engine there is a large quantity of waste heat which may later be utilised in some way to cause ignition without the use of external electrical apparatus. Then, again, the question of engine cylinder cooling is one which is at present far from being settled. The present system necessitates water-jackets, tanks, pumps, radiators, and other fittings, all of which either take up space or absorb power. In America the air-cooling principle is making steady headway, and the progress in that direction is well worthy of careful attention, especially as it is one which tends towards simplicity, a desiderata which should be the object of all automobile engineers.

### Magneto Ignition.

In connection with the increasing popularity of magneto ignition on petrol cars rather widely different views appear to be held by manufacturers as to the desirability or otherwise of making provision for advancing and retarding the sparking. It is a phenomenon well known to those having experience in dynamos and magnetos that the intensity of the current and the moment of maximum intensity advances as the speed of the armature increases. Basing their action on this fact, several makers claim that the timing of the spark does not need to be altered by the motorist, and as a consequence the magneto armature and distributors or the make and break cams are rigidly keyed to their respective shafts, and no timing variations

are possible. In some others, on the contrary, the magneto armature, or the cams, or both, can be altered in their position at any time during the running of the engine, exactly as in the accumulator and coil system of ignition. Others, and among them notably the Brasier Company, hold still different views. The time of sparking is normally set at a certain angle of advance and cannot be altered from the seat, yet, by simply pushing the starting handle into place, the ignition is retarded to a predetermined extent, permitting the engine to be started with absolute safety and without any fear of a back-fire, the apparatus resuming the advanced position as soon as the handle is released.

### Exhaust Troubles.

To remove the objection so often raised against the exhaust on a petrol car being led out behind, the Austin Motor Company have designed and patented an arrangement which is worthy of notice. The accompanying illustration shows very clearly the arrangement, which briefly comprises a two or three-way valve fitted to the exit of the silencer, so that the exhaust gases may be led to the near or off side of the car, or, if preferred, to both sides and the rear. The valve is operated from the

Elevation and Plan of Austin Exhaust Outlet Control.

driver's seat, and it is assumed that when drawing up to the near or off side of the road the driver will turn the valve so that the gases may be led into the middle of the road, where they would be least objectionable. The device, which is to be fitted to all Austin cars, will be particularly advantageous when the vehicle is standing in queue, waiting at crossings or at the theatre, or when proceeding at a slow pace in crowded thoroughfares, as at these times especially the motor is running as slow as possible, and the gases are, consequently, more pungent than usual, causing annoyance to the occupants of following cars or carriages.

ON Tuesday a 22-36-h.p. Fiat car, with the Pradeau wheel attached, was started on an A.C.G.B.I. trial. The wheel consists of two rims. At the outer ends of the spokes cylinders are provided, which are fixed to the inner rim. Each cylinder contains a spring. Engaging in these cylinders are forked plungers which are attached by links to bearing pieces which are fixed to the outer rim, by which means the weight is always distributed on one half of the springs, and these links and bearings also allow lateral movement. Solid rubber tyres are used, and a run of 4,000 miles is contemplated.

## CONTINENTAL NOTES.

### The Ostend Automobile Week.

The Antwerp Automobile Club has provisionally fixed July 14th as the start of this year's automobile week at Ostend. The programme will probably include a 600-kilometre reliability contest, mile and kilometre speed trials, and five and ten kilometre races for touring cars.

### A Motor 'Bus Competition in Italy.

A trial of motor-buses is to be organised in connection with the forthcoming international exhibition in Milan. The competing

### A Dutch Motor-Car Exhibition.

A motor-car and cycle exhibition was opened in Amsterdam on Friday last week. There are about sixty-five exhibitors, who are showing examples of all the leading French, Belgian and German cars. England is represented by the Humber and Rover vehicles.

### Motor-Cars for Military Purposes.

A mobilisation order has been received by all the owners of motor-cars in Munich. The order holds good until April 1st, and commands the appearance of all motor-cars at the Bavarian Ministry of War on the second day of any said mobilisation. The cars must be in the hands of efficient drivers, and be equipped with fuel sufficient for at least 150 kilometres.

### Motor-Car Accidents in Germany.

The German Ministry of the Interior has given instructions that as from April 1st next a record of all motor-car accidents in

Figs. 1 and 2.—Elevation and Plan of Chassis of Brasier 25-36-h.p. Car. (See page 29.)

A. Water inlet.  
B. Throttle lever.

E. Mechanical lubricator.

G. G. Clutch shaft joints.  
H. Countershaft brake.

I. Rear wheel brakes.  
J. Inspection hole in differential case.  
K. Inspection hole in gear-box.

vehicles must be capable of carrying at least ten passengers, and will be required to cover a daily distance of  $37\frac{1}{2}$  miles during the course of the show. A long-distance run from Milan to Como, Erba, and back, at a minimum speed of  $12\frac{1}{2}$  miles per hour, will also be included in the programme.

### A German Touring Competition.

Under the auspices of the Automobile Clubs of Bielefeld, Frankfort, Hanover, Cologne, Coblenz, and Wiesbaden, a three-days' touring competition is to be held in July next. The first day's run will be from Bielefeld to Hanover over a zigzag course, the second from Hanover to Frankfort-on-Maine, via Gottingen and Fulda, and the third from Frankfort to Cologne, via Wiesbaden and Coblenz, the total distance being about 1,000 kilometres.

Germany, together with particulars of the injuries, etc., sustained, shall be kept, to enable an official return to be compiled by the Imperial Statistics Office.

### Miscellaneous Items.

A service of motor-buses is shortly to be started in Paris between Saint-Maur-les-Fosses and the Porte de Vincennes. —The Touring Committee of the A.C.F. is considering a proposal to draw up a series of instructions regarding motor-car traffic which teachers in elementary schools may convey to their scholars. —The kilometre race for the Sneden cup, organised by the Algerian Automobile Club, is to be run off on Sunday next. —A public motor-car service has just been started between Lille and Halluin, France.

## The 1906 Brasier Cars.

THE vehicles which have hitherto borne the name Richard-Brasier are, in order to avoid confusion, in future to be known as the Brasier. Some particulars of the 1906 models were given in our report of the Paris *Salon*; the cars, however, contain a number of interesting features, a more complete account of which will, no doubt, prove acceptable, especially as some, if not all, the changes that have been made

| B. Covers to core holes of cylinder castings. | K. Governor rod.            |
| F. Petrol pipe.                               | R. Governor.                |
|   | V. Flywheel.                |

are the result of M. Brasier's experience in turning out cars which proved successful in winning the Gordon Bennett race two years in succession. The 1906 models are three in number, viz., 15-24-h.p., 25-36-h.p., and 50-60-h.p. The first is, as usual, provided with cardan shaft transmission, while the other two have side chain drive, this being a new and notable departure with the Brasier Company, who are represented in this country by Messrs. Mann and Overtons, Limited. The frames are rectangular in shape, and are of pressed steel, the motor and gear-box being carried on a tubular under frame, which extends almost to the rear of the car. All three types are fitted with four-cylinder engines, which are very clearly illustrated herewith, Fig. 3 above giving a view of the valve-side of the motor, Fig. 7, page 30, a general view of the ignition side, and Fig. 6 a front end view with the cover of the half-time gear wheels removed in order to clearly show the latter. As will be seen, the cylinders are cast in two pairs; a noteworthy feature, which has already been pointed out, is that the crank-shaft is *desaxe*, that is to say, its centre is slightly out of line with that of the cylinders, as shown in Fig. 6. The advantage of this method of construction has so recently been dealt with in these columns that it is unnecessary to refer to them on the present occasion. In order to further reduce the frictional losses against the cylinder wall, M. Brasier has also increased the lengths of the connecting rods. As there is a smaller angle of thrust for a given stroke, there is also a reduced lateral pressure against the cylinder, and a consequent gain in efficiency, friction being reduced, and the general balancing of the engine much improved. Another feature is that very

long pistons are employed, the three piston rings being above the gudgeon pin; the wear is in this way distributed over a larger area, and oil is prevented from reaching the combustion chamber. The cylinder dimensions of the 15-24-h.p. engine are 90 mm. by 120 mm.; of the 25-36-h.p., 112 mm. by 130 mm., and of the 50-60-h.p. 130 mm. by 140 mm. The interchangeable inlet and exhaust valves are mechanically operated off a single cam shaft, instead of being located on opposite sides of the cylinders. The cam shafts are made stouter in diameter than formerly, and are cut from the bar with the cams formed integral. The profile of the cams is such that it gives a flow of gases proportional to the speed of the piston during the different portions of the stroke, the effect of the momentum of the charge and other factors of disturbance having been carefully calculated and taken into consideration. The half-speed gears are made stronger than on the previous models; they are mounted on the tapered ends of their shafts and keyed, a nut drawing the whole together. The gases coming from all four exhaust valves are led into a single longitudinal casting which is water-jacketed, this leading in turn to the silencer. The object of this construction is to reduce the tendency of the exhaust valves to overheat, to increase the silent running of the engine, and to reduce the back pressure at the silencer, by contracting the charge.

The ignition is by low-tension magneto, a most interesting change having been made in the system, which should overcome many of the objections that are often raised to the make-and-break method. All the usual array of rods, springs, levers, etc., is done away with, and is replaced by a special camshaft horizontally mounted on top of the cylinders and running on ball

Figs. 4 and 5.—Sectional views of Carburettor. The right-hand drawing is a cross section through line a-b.

bearings (Fig. 7). The cams carried on this shaft directly actuate the outside end of the internal strikers of the ignition plugs. The vertical shaft, which drives the ignition cam-shaft through bevel gearing, is itself similarly driven off a horizontal half-speed shaft; it carries an automatic dog-clutch coupling, which has for its purpose to cut out the drive to the upper shaft in case of a back fire in the engine. The magneto, which is gear driven, is fastened to one of the carrying lugs of the crank-case, and is held by hinged bolts and finger screws, which make

its removal an easy matter. The point of ignition is fixed, except at starting, when it is automatically retarded.

The carburettor, of which two views are given, Figs. 4 and 5, is of the automatic regulation type, the delivery of the gas to the induction pipe being determined as to quantity by the position of the sliding piston throttle valve J, which is controlled by the governor or by hand from the steering wheel. The automatic valve rises and falls in accordance with the amount of vacuum in the jet chamber. It will be seen from Fig. 4 that provision is made for the connection of a pipe from above the jet chamber to the side of the automatic valve chamber *m*. By this tubular connection the depression produced in the jet chamber by the suction of the motor also occurs in the space above the piston L, and causes the same to rise or fall proportionately. The valve O and the piston having, however, a common spindle, the former rises and falls in consonance with the piston, and opens or closes an aperture in N, thus admitting extra air to form a correct mixture, which passes along the inlet pipe A, the neat, symmetrical arrangement of which is seen in Fig. 3, to the engine. The governor is arranged to act directly upon the horizontal piston valve in the carburettor,

## USEFUL NOTES.

ONE of the evil effects of using too much lubricating oil in the cylinder is the clogging up of the silencer. This, if carried far enough, results in excessive back pressure and consequent loss of power.

It cannot too often be pointed out that novices in motor matters should be very careful to see that the ignition lever of their cars is retarded before they attempt to start the engine. Otherwise the nasty blow of a "back-fire" may be experienced.

LEATHER-FACED cone friction clutches are sometimes troublesome, but the trouble may usually be traced either to the fact that the driver does not thoroughly understand how to use and adjust his clutch, or that the clutch is of inferior design and construction. Generally speaking, the driver is at fault, and makes matters worse by treating the clutch with various compounds, all of which are more or less detrimental to its life and wearing, though they may remedy the trouble for a short time.

IN nearly every instance it will be found that the trouble is either—(a) The clutch is very fierce and engages with a

Fig. 6.—End view of Brasler Motor with Cover enclosing Cam Shaft Driving Pinions Detached.

Fig. 7.—View of Magneto Side of Brasler Motor.

throttling the feed of gas to all four cylinders, and giving a very gradual increase or decrease of engine speed, which can be varied from 200 to 1,200 revolutions per minute.

In the 25-36-h.p. and 50-60-h.p. motors a half compression device is provided to facilitate starting, this being controlled from the front of the engine and acting on the exhaust valves. The water cooling is by natural circulation for the two smaller sizes, but an unusually powerful pump is used on the 50-60-h.p. car. The radiators are of the framed ribbed-tube type, as in 1905, but larger, a fan only being fitted in the case of the 15-24-h.p. and 25-36-h.p. cars. Forced lubrication of the engine is achieved by a mechanical oiler driven off the horizontal ignition shaft. The lubricator is provided with a device whereby when driving through towns the delivery of oil to the cylinders can be arrested from the dashboard, the splash lubrication providing all that is necessary when the engine is running at slow speeds. The crank chamber, it will be noticed, is of somewhat unusual section, the comparative narrowness, coupled with the perpendicular sides, having been adopted to obviate too profuse splash distribution of the oil on the cylinder walls while at the same time allowing for a large reserve in the base chamber.

*To be concluded.*

violent shock, or (b) the clutch slips badly and at times refuses to drive the car. A fierce clutch is generally due to very new leather, which has not been treated with castor oil to make the leather pliable, as all new clutch leathers should be; or, again, it may be due to the fact that the male cone does not engage truly with the female—that is, the leather only bites in certain places. As above stated, the first trouble may be remedied by castor oil. The clutch pedal should be depressed and the oil laid on lightly with a small brush; it will be found that the fierceness will very soon disappear, owing to the leather becoming pliable, and as soon as the fierceness has worn off it will be advisable to slightly tighten up the clutch spring. As regards the clutch which does not engage truly, this is a more difficult matter to deal with, as it means taking the clutch right down and trueing up the leather; if, however, the latter is only very slightly out of truth, the cure may be effected without taking the clutch right down: the connections must be undone, the spring removed, and the male cone pulled back; then, by turning the male cone round in the female portion, it can be seen where the leather touches; by gently rasping the spots where the leather touches the surface can be made even so that the leather will touch evenly all round.

MESSRS. MORGAN AND CO., the carriage builders, of Long Acre, W.C., are building a factory at Leighton Buzzard.

THE desirability or otherwise of organising a race for steam cars this year is being considered by the Competitions Committee—the new name of the Races' Committee—with a view to a full report to the A.C.G.B.I.

THE Prested Miners' Gas Indicating Electric Lamp Company, Limited, who are already well known from the success of their accumulator, the Prested battery, and the different motor accessories which they manufacture at their works at Holloway, London, have issued a new list of induction coils for ignition purposes, containing several new patterns which show departures from ordinary types of coils. We show one of these in the accompanying illustration, which represents the new Prested multi-

cylinder coil, built up of separate interchangeable units, each unit being capable of being withdrawn when necessary for the purpose of change or repair, so that it is not necessary to send the whole coil away for repair if anything should go wrong with it, the faulty portion being simply removed and replaced with a new one while the defective part is repaired. The coils shown in the Prested list include types for engines of various sizes, including those for motor-bicycles and also for special work outside motoring.

THE London and South Western Railway Company's new motor-omnibuses and the new motor-vehicles of the Great Eastern Railway Company are fitted with Royal Sirdar-Buffer tyres.

THE Beaconsfield District Council have asked the Bucks County Council to petition the Local Government Board to limit the speed of motor-cars passing through that township to four miles per hour.

SIR P. A. MUNTZ, M.P., speaking at the annual meeting of the Shire Horse Society, said that the demand for horses increased when the railways came into existence, so the horse would maintain its position in spite of the motor-car.

SUBSEQUENT to our visit to the motor-car show in Manchester last week, a new chain-driven car, known as the "Lacoba," put in an appearance. It is being placed on the market by Mr. E. J. Chambers, of Swinton, Manchester, and is fitted with a Sigma 12-16-h.p. four-cylinder engine.

Two minutes 30 2-5 sec. is the record time for tyre fitting which has just been accomplished by the winner of the competition held by the Continental Tyre Company at the recent motor exhibition in Berlin. The previous record for taking off and replacing a tyre cover and tube was 5 min. 48 2-5 sec.

MESSRS. LEGROS AND KNOWLES, LIMITED, have sent us a copy of the 1906 catalogue of Iris cars they have just issued. Two sizes are being made—25-30-h.p. and 35-40-h.p.—and of these not only are full particulars given, but illustrations of all the principal parts as well as of the different types of complete vehicles.

## HERE AND THERE.

MR. H. J. DOUGHTY has opened a motor garage opposite the Stockwell electric railway station in the Clapham Rd., S.W.

BETWEEN June last and the present time Mr. Rougham, the inspector of Royal park-keepers in London, has cautioned fifty motor-car drivers for allowing their vehicles to emit offensive smoke in the parks.

THE magistrate at the Stratford police court has declared his opinion that every one who gets drunk while in charge of horses should be sent to prison.

COMPLAINT has been made to the directors of the Leith Chamber of Commerce with regard to the noise of the motor lorries now employed in the local traffic.

THE T. section of the catalogue of Messrs. Alfred Herbert, Limited, deals with gear cutting appliances, including an automatic spur gear cutting machine and semi-automatic bevel gear shaper.

MOTOR-CAR repairs are now being executed by Messrs. Fletcher and Phillipson at their works in Pembroke Street, Dublin, which have been extended to meet the needs of the new department.

TELEPHONIC communication with the north was temporarily suspended on Monday owing to a motor-car crashing into and breaking a post near Preston. The unfortunate motorists had a remarkable escape.

ACCORDING to a estimate made by Mr. J. H. Mann at a meeting of the Leeds Association of Engineers, there are 100,000 motor-cars and motor-cycles in use in Great Britain, representing a value of £15,000,000.

THE next London examination for the A.C.G.B.I. driving and mechanical proficiency certificates is to be held at 119, Piccadilly, W., on Wednesday, March 14th. This date has been fixed in addition to the 21st, previously announced.

It is generally understood nowadays that there are two forms of skid, or slip, viz., the skid of the tyre in a circum-

ferential direction on the back wheels of a car when the tyre is being driven forward by the engine, or being retarded by the brake; and the side-slip in a lateral direction which occurs on both front and hind wheels, particularly on the latter, as this movement is generally initiated through the circumferential skid. The new design of rubber tread, which Messrs. D. Moseley and Sons have introduced, is applicable to almost any make of tyre which requires retreading. We understand that with the exception of this new design the retreading work is precisely the same as that which has been so popular during the last two years, and it is said that many covers which have been retreaded by the firm have actually given a greater mileage of work without puncture or mishap than the original new tyres have given. The cost of upkeep of tyres on the average motor-car

is so heavy that retreading work may be recommended, when scientifically done, as shown in the accompanying illustration.

A.C.G.B.I. examinations for driving certificates will be held at Dublin on April 2nd, Waterford on the following day, Cork on the 4th, Dundalk on the 5th, and Belfast on the 6th prox. Intending entrants should communicate with the Irish Automobile Club, Ann's Lane, Dublin.

AN order for a 24-40-h.p. Itala car has been placed by Mr. W. K. Vanderbilt, Jun., with the Fabry Automobile Company, Limited.

WE illustrate herewith an ingenious cap for petrol and water tanks, and for radiators, which has lately been introduced into this country by the United Motor Industries, Ltd. The feature of the cap, which is known as the "Express," is the facility with which it can be put on and taken off, even in the

dark. From the illustration it will be seen that a number of steel balls A are set in the body of the cap, which has simply to be pushed into the filling hole of the tank, the cap being held in position by the balls pressing under the action of springs behind them against the neck B. The cap is instantaneously removed by a slight upward pull. The idea is also being applied to axle caps.

MESSRS. SEYMOURS, LIMITED, are opening a School of Motoring on the first floor of 18, Brompton Road, S.W.

MESSRS. CHALMERS AND Co., of Redhill, and Messrs. Stannard, of Reigate, have been appointed repairers to the East Surrey Automobile Club.

MESSRS. J. C. MOUNT AND Co., 136, Grosvenor Road, Westminster, have started a special department for packing motor-cars and *chassis* for export.

MESSRS. JACKSON AND HEARD are arranging for lessons in automobile driving and management at their demonstration rooms, 14, Dover Street, Piccadilly, W.

FROM Mr. E. H. Wait, Leicester, comes a copy of the 1906 catalogue of Clyde motor-cars and cycles he has just issued. Illustrations and particulars of the various types are given in the list, which concludes with a number of testimonials from users of the Clyde cars.

THE accompanying illustration depicts the patent locking adjustable spanner recently put on the market by Messrs. J. B. Brooks and Co., Limited, Birmingham. As will be seen, the two main parts are adjustable to embrace nuts of different sizes by the upper member sliding up or down the two threaded bolts. The mill-edged nut outside tightens the spanner upon the nut, and a similar nut inside the shorter bolt fixes the jaws

immovably, a spring between the members drawing the jaws apart as the upper milled nut is unscrewed. Unlike other adjustable spanners, this possesses the advantage that when the jaws become worn the central milled nut forces the members apart so as to bring the jaws into perfect parallelism, thus ensuring a tight grip of the nut to be turned. The tool is 6½ in. long and the range of opening of the jaws is from ½ in. to 1½ in.

THE East Herts Automobile Works have opened a garage and repair shop in Ware.

THE Premier Motor Company, Limited, has been registered with a capital of £5,000, and offices at 34, Waterloo Street, Birmingham.

MESSRS. J. T. IRELAND AND CO., LIMITED, is the title of a limited liability company, formed to carry on business in the motor trade at Piper's Row, Wolverhampton.

WITH offices at 144, Lionel Street, Birmingham, the Crusader Cycle Company, Limited, has been registered, to deal in motor-cycles as well as those of the ordinary type.

AT the annual meeting of the Royal National Lifeboat Institution, the committee's report foreshadowed the greater efficiency of the service as a result of the adoption of motors in the lifeboats.

ON Saturday the inaugural dinner of the Pilgrims' Way Motor Company, Limited, whose works are at Weydon Hill was held at Farnham, Mr. F. Leigh Martineau, managing director, presiding.

WE illustrate herewith a new electric tail lamp known as the "Safety," which has lately been put on the market by Mr. J. W. Greenwood, Halifax. Although the illustration, which is a sectional view, only shows one electric lamp, two are arranged side by side fitted in separate holders on an ebonite base. One of the lamp-holders is enamelled red and the other white; underneath the base is a simple device for only allowing the lamp in the white holder to burn, but should anything happen to it, such as filament breaking, etc., the other lamp

immediately lights up and removes any possibilities of a motorist travelling without a tail light. Two set screws are provided on the holders to prevent any chance of the lamps unscrewing with vibration, and these must be slackened before trying to remove the lamps. It is recommended by the maker that, to make sure that the accumulator does not run down, and also to ensure that the lamp is burning, the latter should be connected up to the ignition accumulator and a spare battery. In this way, if the light goes out, the engine stops also, it being then only necessary to switch on to the spare accumulator. The lamp itself is fitted with a powerful bull's-eye lens and silver reflector, together with stout brass body.

THE British Bariquand and Marre Engine Company, Limited, has been registered, with offices at 18, Leadenhall Street, E.C., to acquire the sole agency for Great Britain for the sale of the Bariquand and Marre motors.

WE have received from Messrs. Smith, Parfrey and Co. their new catalogue of all kinds of wheels for automobiles. This is fully comprehensive and also includes their specialities in coach and carriage work, bent timber and the like. They have a welding plant at the new works at Hammersmith, and can undertake every description of work coming under that heading

## CORRESPONDENCE

Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, W.C.]

### THE TWO-CYLINDER ENGINE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the technical and general press for months past the question of four-cylinders versus six or eight has been hotly debated. Doubtless there is something to be said for the larger number, but the advantages are not all on one side. The fewer cylinders employed the smaller is the number of working parts, and consequently the greater the simplicity. And this brings out a point that has been overlooked in the discussions on the number of cylinders. Where does the two-cylinder car come in? It will probably surprise many readers to be told that not much less than 50 per cent. of all the cars one meets on the roads are two-cylinder cars. Now, if every second car is a two-cylinder, and if two-cylinders were not quite good enough for a large class of motorists, we ought to hear a great deal about their shortcomings. As a matter of fact, such complaints, which would be in evidence on every hand if the two-cylinder car were inherently unsatisfactory, are non-existent. Many hundreds of two-cylinder cars

from one having two or three times the number of cylinders. The best makers do not usually differentiate in the finish and appointments of their various models, the number of cylinders and the consequent horsepower being practically the only difference between the one and the other.

Another feature of the case is that a four-cylinder engine is not necessarily better or more reliable in any way than a two-cylinder. There are cars on the market to-day with four-cylinder engines that are little better than toys—engines of small diameter, bore and stroke, and of frail construction, that are bound to develop trouble sooner or later. These engines are adopted because they are cheap, but it is questionable if cars fitted with them can be considered cheap at any price. One is far better off in every respect with a good two-cylinder engine of scientific design and substantial construction than with a four-cylinder motor that is being urged, in the most favourable circumstances, up to the top of its power, and that is seriously strained when hills are met. In point of speed, too, the two-cylinder car is fully equal to all requirements. Every motorist knows that the real speed limit in this country is not the restriction imposed by law, but that necessitated by the sinuosities of the roads and the exigencies of traffic. It is well within the mark to say that any well made two-cylinder car will yield, without being strained, all the speed that can be used with any degree of safety on quite 75 per cent. of our roads.

It is to be feared that the drift of the recent discussions has been to produce an impression that a two-cylinder car is not a vehicle capable of giving satisfaction in everyday use, but nothing could be further from the fact; and if anybody has been deterred from taking up the pastime of motoring by such considerations, he is depriving

The Motor-Car Race in Cuba. Lancia starting on the Flat.

are in daily use in all parts of the world, giving great enjoyment to their owners, whose only reminder of the fewness of their cylinders is their freedom from trouble. There was a time, not long ago, when owners of single and double-cylinder cars were to be sympathised with, and in those days the advertising pages of the motor press bore eloquent testimony, in their many columns of second-hands for sale, to the dissatisfaction existing with the 6 and 8-h.p. vehicles with which many made their entrance into motoring. Those small cars were sadly deficient in power, and had an awkward habit of giving out on hills of even moderate gradient. But great strides have been made since then towards the perfection of the machinery and the distribution of the weight of car and occupants, and it would be a task of considerable difficulty to find a hill that could not be surmounted by any modern two-cylinder car with a full load of passengers.

From the point of view of simplicity, the claims of the two-cylinder engine are irresistible. Every additional cylinder means added complication, extra pistons and piston rings, gudgeon pins, valves and valve springs, and extra sparking plugs and connections. None of these things now cause the worry they did in days past, but in none of them has perfection yet been reached, and defects are not unknown. The two-cylinder engine has only half as many of these parts as the four, and consequently only half the liability to derangement. This is a point of great importance. Then there is the question of cost. The two-cylinder car costs less to run and less to maintain, and, provided it is by a reputable maker, it will more than meet all reasonable requirements in regard to speed, hill-climbing, and carrying accommodation. Indeed, in this last respect there is little to choose between the best of the two-cylinder cars and the higher powered ones, several different makes of the former class being designed to carry five persons comfortably. In appearance the two-cylinder is generally indistinguishable

himself of the great pleasures that are to be derived from the use of a good two-cylinder car. In a word, the two-cylinder car is cheaper to run, and cheaper and easier to maintain, than one with four, six or eight cylinders, while for everybody except those with an abnormal craze for horse-power, it provides all the speed and all the power that can be desired.—Yours truly,

DUOMOTOR.

### WHICH BRAKES SHOULD BE MOSTLY USED ON LIVE AXLE CARS?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I quite agree with the important point raised by Mr. F. F. Wellington. The system he advocates has been used on the Owen-Arrow cars always. I designed the brakes with the express purpose of doing away with the necessity of fitting one on the propeller shaft. My cars were the first, I believe, to have four brakes, and they are so arranged that both an internal and external brake is fitted to each driving wheel. By this means I provide one extra brake and dispense with that usually found on the cardan shaft or behind the gearbox in other cars.—Yours truly,

E. H. OWEN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I agree with Mr. Wellington that it is most important the foot brake should be used with great care, as every other portion of the mechanism of a car should be used, but I cannot agree that the purchase on the back brake is one-third greater as a rule than the pressure on the foot brake, in so much as the foot brake works through a reducing gear

o an average of about 5 $\frac{1}{2}$  or 4 to 1, and, of course, increases the holding power of the foot brake in direct proportion. The increase, of course, in a live axle car is obtained in the bevels, and in the chain-driven cars in the sprocket wheels.—Yours truly,

MAWDSLEY BROOKE.

### STEAM v. PETROL

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having just completed the purchase of my first car (steam) you will understand that I read all I can on the subject of the respective merits of steam v. petrol. After having perused the latest issue of the *M.C.J.*, the idea has occurred to me as to whether it would be possible to estimate the number of miles which could be relatively covered by steam or petrol cars (ordinary touring cars) of the same b.h.p. at the road wheels, in return for the expenditure for any named sum, say £20–50.

This must be a question of supreme interest to any prospective purchaser, and a most satisfactory way of deciding it would be by having a trial on the basis of so much cost per mile at an average speed of say, eighteen miles per hour or over.—Yours truly,

J. H. BROOKES SMITH.

From a caricature]

Baron Henri de Rothschild.

[in *Le Chauffeur*.

### THE CLUB TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The way in which the Automobile Club has lately managed its trials should lead the new committee to pause before sanctioning further enterprises of the kind. Compared with the organisation that was something to admire in the days of the 1,000 miles trial and of that to which we were accustomed when the Crystal Palace was the venue, the arrangements now in vogue are amateurish and wanting in decision. After the van trial fiasco there were hopes that efforts would be made to retrieve the lowered reputation of the Club; but, so far as I can learn, the way in which the tests now taking place have been dealt with leaves much to be desired on that account.

The recent efforts of the Club to prevent makers having runs on their own account is a policy of the dog in the manger when we remember that the vaunted Tourist Trophy contest has been retarded till the autumn. Fortunately the Scottish Club has given manufacturers an opportunity of demonstrating their prowess, and they can rely on the organisation of the event being reliable and perfect. But surely it is time the A.C.G.B.I. gave up such vain efforts.—Yours truly,

A. B. ENGLAND.

### THE COST OF CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. S. F. Edge, with his usual ability for making himself prominent, has been suggesting that the British motor-car trade, for the purposes of combating the foreign industry, should give a three years' guarantee, and suggests that his brother British manufacturers should do the same. In view of the difference in price charged by Mr. Edge for his goods, and those charged by other of his British and foreign competitors, I would suggest that the proposition is a bad one coming from him; and I would equally suggest that, before he makes such propositions, he should first consider the advisability for the benefit of the British industry of bringing his prices down to the level of other makers and in proportion thereto.

To make my letter as short as possible, I give you hereunder a list of cars with their respective bores and strokes, their cubical contents, their brake horse power calculated at ten cubic inches for 1-h.p., which is a good maximum efficiency, the price of each vehicle, and the price per b.h.p. :—

- 40-h.p. Napier, 4 in. by 4 in. (6 cylinders) = 300 cubic in. contents or 30-b.h.p. Price £1,250 = £41.50 per b.h.p.
- 30-h.p. Maudslay, 4 $\frac{1}{2}$  in. by 4 in. (6 cylinders) = 380 cubic in. contents or 38-b.h.p. Price £825 = £22.75 per b.h.p.
- 24-h.p. Fiat, 125 mm. by 150 mm. (4 cylinders) = 450 cubic in. contents or 45-b.h.p. Price £720 = £16 per b.h.p.
- 32-h.p. Siddeley, 5 $\frac{1}{2}$  in. by 5 in. (4 cylinders) = 430 cubic in. contents or 43-b.h.p. Price £775 = £18 per b.h.p.
- 35-h.p. Daimler, 134 mm. by 150 mm. (4 cylinders) = 520 cubic in. contents or 52-b.h.p. Price £990 = £19 per b.h.p.
- 24-h.p. Itala, 130 mm. by 140 mm. (4 cylinders) = 460 cubic in. contents or 46-b.h.p. Price £850 = £18.40 per b.h.p.
- 40-h.p. De Dietrich, 130 mm. by 160 mm. (4 cylinders) = 510 cubic in. contents, 51-b.h.p. Price £1,110 = £21.50 per b.h.p.

In comparison with each and every of the makers above quoted, Mr. Edge's car works out as follows:—In comparison with the Maudslay, he should charge £680 for his chassis, or in comparison he is £570 too dear. In comparison with the Fiat, he should charge £480 for his chassis, or he is £770 too dear. In comparison with the Siddeley, he should charge £540, or he is £710 too dear. In comparison with the Daimler, he should charge £770, or he is £480 too dear. In comparison with the Itala, he should charge £550, or he is £700 too dear. In comparison with the De Dietrich, he should charge £645, or he is £805 too dear.

Further comment is needless. Mr. Edge can give three, four and five years' guarantee, and even then he is dearer than his competitors, and I repeat it does not come well from him to suggest that his competitors, who are so much cheaper, should give such lengthy guarantees.

I have every pleasure in sending a copy of this letter to each of the firms whose names I have taken the liberty of mentioning, and trust that you will find space for my letter in defence of both British and foreign manufacturers.—Yours truly,

D. M. WEIGEL.

We have also received several other letters on the subject, including one from Mr. S. F. Edge. Unfortunately, the tone of some renders them unsuitable for our correspondence columns.

### THREE-CYLINDER ENGINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We see that Mr. Mawdsley Brooke is somewhat altering the opinions expressed by him a few years since when he was making three-cylinder engines, though we notice he still is of the opinion, which is what we have always contended for, that a well made three-cylinder motor will run more sweetly than a badly made four-cylinder one, and that with the best construction of both in practical use there is little, if anything, to choose between them, with the advantage of 30 per cent. of simplicity in favour of the lesser number. We confess we cannot follow Mr. Brooke's "pendulum motion." Certainly we have never noticed anything of the kind, nor can we see what difference it can possibly make whether the engines are fired 3, 1, 2, or 1, 2, 3, in either case giving the same practical continuity of torque to the crank shaft. The main point of our contention is that the needs of the public in steadiness of running are, for all practical purposes, as fully met with the three-cylinder engine as with the four, and that with a considerable decrease in the number of parts used.

THE DURYEA MOTOR CO.

### POLICE NESCIENCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It may interest fellow readers of the *M.C.J.* to hear of an interesting case of police ignorance experienced by myself last Sunday in Portsmouth. It was about 7 p.m. and I had driven my car to the ferry to try and get across when the constable on duty there asked me why my head lamps were not alight, in order that he could see in y

front number. I called his attention to my side lamps and rear lamp, which were alight, but this failed to convince him I was in the law, and he persisted in his original idea that my front number should be illuminated, although, when requested to summon me on that count, he considerably declined.—Your truly,

ARCHIBALD GRAY.

### DRIVING CERTIFICATES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Might I complain through your valuable paper against the attitude of the Automobile Club in their endeavours to make it the universal custom for owners, etc., to employ only holders of the Club's efficiency certificates?

I think this is putting a very unfair tax on drivers. Of course, there are several members of the Automobile Club who are willing to pay the fees to have their drivers examined, but at the same time there are a great many drivers—especially those who are employed by firms—who will have to stand the expense themselves, and I must say I think drivers have enough responsibilities to stand already without having additional taxes put on their shoulders.

its way to adopt the price basis for the fuel, yet we consider this is an improvement on the former regulations.—Yours truly,

JOHN E. GIBBS AND CO.

### A WARNING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been the victim of a trick that it is well you should know about. A young man called on me from an imaginary garage. He nominally came from one at Kilburn, and said he was sent to see my references, finishing by wanting me to call on the manager on a morning later, promising me a job to drive a motor-car. Needless to say no such place existed.

Before leaving he said he had had to leave his car elsewhere, having fallen short of petrol, and borrowed 2s. 6d. When I went to Kilburn I heard that several had been asking for the same garage, so probably I am not the only victim. I daresay you will warn the public who advertise in your paper of this trick.—Yours truly,

A VICTIM.

[We would certainly warn our readers against lending money to strangers, and say, with Polonius, "Neither a borrower nor a lender be."]

The 35-40-h.p. Opel Darracq Military Motor-Car exhibited at the recent Berlin Exhibition.

The vehicle, which has been built to the designs of Herr E. A. Schmidt, is equipped with two quick-firing guns and four Mauser pistols, the body being encased in armour plate 6 mm. thick. [Allgemeine Automobil Zeitung.]

888: In any case I do not think the examinations should be held by the Automobile Club but by the Board of Trade, as 'marine engineers', etc., examinations are held.—Yours truly,

F. C. M.

### THE TOURIST TROPHY RACE REGULATIONS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We are very pleased to learn that an assurance has been given by the A.C.G.B.I. that "any car may enter for the Tourist Trophy Race with the exception of electrically propelled vehicles, and that each competitor is asked to state which fuel he prefers, when it will be supplied accordingly." This statement is, of course, of the greatest importance to those who wish to enter cars which use fuel other than petrol for the Tourist Trophy Race. We are all the more pleased to hear that any fuel will be supplied according to the wish of the competitor, because we had received a communication from the A.C.G.B.I., stating that "petroleum spirit will be the only fuel supplied for the race of 1906." This rule, we take it, must now have been altered. Although we regret that the A.C.G.B.I. has not seen

AUTOMATIC TYRE PUMPS OR INFLATORS.—The Heron Motor Company, Birmingham, writes:—"Referring to 'Western's' letter in the *M.C.J.* of 24th February, we are shortly putting on the market a new power inflator which will be adaptable to any car. It has points of advantage over anything hitherto designed for this work, and we shall be pleased to forward particulars as soon as the necessary protection is secured."

MOTORS ON HIRE.—We have an inquiry as to the name of a firm letting motors on hire to haul trucks or vans in the London district.

FROM ST. AUSTELL a doctor writes:—"Recently I put an advertisement, wanting a car, in the *M.C.J.* This appeared only once. From that I received 117 replies. It has been impossible to answer all these letters, but it speaks highly of your journal as an advertising medium."

MR. GEORGE HURST writes with reference to the advertisement of one of his chassis for sale as a new one at £220. The lowest trade price is above that figure; hence the chassis in question is not a new one.

SOLARINE POLISH.—E. W. is anxious to know where he can obtain "Solarine" polish on wholesale terms.

## SPRING SUSPENSION.

Of all the problems which vex the automobile designer one of the most important is that of flexibly mounting the vehicle. It is also much more complex than the simplicity of the resulting mechanism would seem to indicate to the lay mind. The chassis must be so flexible as to accommodate itself to the inequalities of the road without straining the working parts; it must be sufficiently substantial to withstand all shocks, incalculable in their possible magnitude, to which it will be subjected; it must be sufficiently sensitive to cradle the weight of a child, yet strong enough to endure tremendous impacts. It is the framework of the car, moreover, which is most apt to be slighted in the daily round of attention after a car has been in service for some little time, because of its very simplicity. Nuts are allowed to work loose, axles to get out of line, and shackles and springs to go without oil, and finally to rust—yet any mishap in that quarter is looked on with surprise.

While some important changes have been wrought in chassis construction during the past two or three years, there have been no strikingly radical or unexpected innovations, and there does not seem much room for further development of this part so long as the methods of production and application of power remain unchanged. But the tyre problem and the spring problem, co-related as they are, yet offer great opportunities to inventive genius. A decrease in the resiliency of the tyre demands an increase in the elasticity of the springs and vice versa, so that a balance must be struck between the two. The exact relation between them remains yet to be fully established, but it is not at all unlikely that ultimately tyres of a less effective and more dependable nature than the pneumatic will be used largely, and the springs will be called upon to furnish the greater part of the cushioning effect. Present indications would seem to point to such a possibility, at all events. This will certainly lead to considerable improvement in the methods of suspension. At present the cushioning work is divided between the tyres and the springs, the former absorbing the minor shocks and vibration, while the latter take care of the heavy jars.

The chief difficulty hitherto has been to so design the springs that they will yield sufficiently under normal load to deaden all shocks, yet not oscillate excessively under unfavourable conditions. In order to secure this desirable result not only must the springs be flexible but their supports must also be yieldable to a certain extent. The use of long spring arms, particularly those turning outwardly, which are used where the rear springs are offset, very materially aid in securing this result. Advancement in spring suspension has been marked by steady though not too rapid progress. From year to year certain changes have been evident, but they have on the whole been of minor importance, and to-day the springs and their methods of attachment are much like those of three and four years ago. The general lowering of the centre of gravity and the increase of the stability of the machine have been brought about chiefly by changes in the method of shackling.

The practice of offsetting the springs, instead of placing them directly beneath the frame, has increased in popularity to a surprising degree, considering the small number of cars which exhibited this feature a year or so ago. The great advantage in this usage lies not only in the increased stability resulting from the wider base but in that the load on the axles is brought nearer the wheels, and the liability of the axle to spring is therefore greatly reduced. Again, a consideration which probably has even greater weight than this in influencing designers, is that the frame may be swung closer to the axle than is possible where the older method is used, and hence the centre of gravity lowered and the body made more accessible, without the road clearance being affected.

The generally increased length of spring has already been referred to. It is particularly noticeable in several European cars, which a year ago were using thirty-five to forty-five inch springs, and now use springs of forty-five and even fifty-five inches in the rear. This involves several changes in the mode of attachment to the frame. The rear dumb-irons are made much longer, which insures that they yield slightly to sudden shock and thereby assist the work of the spring, and where the side chain drive is used the forward end of the spring is often carried over the sprocket shaft and linked to the front side of the bearing. A particular advantage of the long spring is that, its period of oscillation being longer, the easy riding quality of the machine is enhanced greatly. A few of the springs are, considers a writer in the "Horseless Age," set rather high, their ends coming even with or, in one or two instances, above the level of the frame. In such a case the dumb-irons are inverted, in order to keep the frame down low. In general, however, the height of the springs would appear to be about the same as was customary a year ago, the increased length giving the effect of lower set. The front springs are set directly beneath the frame, and are bolted in front to a rigid arm, often an integral part of the frame, while in the rear they are either suspended from a curved dumb-iron or shackled directly to the frame by a link in compression. A unique method of front suspension is to be seen in one well-known car, which has only a single spring, placed crosswise and shackled to the steering forks on the axle, while it is bolted to the frame beneath the radiator.

The three point support idea as applied in the platform spring is gaining in favour. By the use of this form of spring not only is the ease of riding improved but the general construction is simplified, because the rear spring arms are done away with, the cross spring being clamped directly to the rear cross bar of the frame, or, in a few cases, to an extension of the frame. Illustrations of this latter method are found in the Renault, and in another car in which a tubular extension of the

frame is riveted to the channels at the two rear corners and extends backward a foot or so, the cross spring being clamped to it at the centre.

## MOTOR-CAR MISHAPS.

A MOTOR-CAR proceeding from Sheffield to Dore has met with a serious mishap. Just after turning a corner the car skidded, and before it could be pulled up it collided with the kerbstone at the foot of one of the electric standards. The impact was such as to tear off one of the wheels of the car and to throw one of the passengers out. He was rendered unconscious and was removed to the hospital.

ON Monday evening a motor-car belonging to Mr. Alex. Spencer, of Blackheath, was being driven up Blackheath Hill by the driver, Frederick Cribb, when an eight-year-old lad, named Knight, ran out of a side street and got under the wheels before the driver could pull up. The boy died on the way to the hospital.

## THE SHEFFIELD MOTOR-CAR SHOW.

UNDER the patronage of the Sheffield and District Automobile Club, a motor-car show is this week being held in the Artillery Drill Hall, Sheffield. Although not so large or as important as those lately organised in Liverpool and Manchester, the range of cars which has been got together reflects the progress which is being made in the automobile industry in this important Yorkshire industrial centre. Messrs. Durham, Churchill and Co., whose works are at Grimesthorpe, are of course amongst the exhibitors; they are showing a handsome 24-30-h.p. Hallamshire car with side-entrance body, a 12-14-h.p. vehicle, and the neat, 10 cwt. delivery van illustrated herewith. Various sizes of the Champion friction clutch and Aster engines are also displayed. Messrs. Joseph Tomlinson and Sons, Limited, Sheffield, show the National and Alldays cars; Messrs. Vayson, Easterbrook and Company,

The Churchill 14-h.p. Delivery Van.

the Spyker; Messrs. Thos. Haigh and Company, in conjunction with Messrs. Burdon and Ball, the Wolseley, Brotherhood, Belsize, Vulcan, Darracq, Clement-Talbot, Arrol-Johnston, and an 8-10-h.p. La Plata car fitted with Aster engine; Messrs. Brook, Shaw and Co., Aster and Napier; Mr. A. Farnell, Bradford, Daimlers; the Sheffield Motor Company, Argylls, Humbers, and Cavendish (9-h.p. and 8-10-h.p.); and Messrs. Thompson and Sons, Rex. In the tyre section we noticed the Shrewsbury and Challiner Tyre Company, Limited, and the India Rubber and Gutta-percha and Telegraph Works Company. The show closes to-day (Saturday).

## ROAD REPORTS.

ROCHDALE.—The bridge spanning the Rochdale Canal, and forming the boundary between Rochdale and Milnrow, is to be widened from 13 ft. to 42 ft.—a convenience to all the traffic passing that way.

UCKFIELD.—The Highways Committee of the Uckfield Urban Council is making a thorough investigation of the roads within its area, with the view of improvement for the benefit of those who have occasion to use them.

COMPLAINTS IN KENT.—During last summer various local authorities recommended the coating of the roads with a preparation of which tar was the main ingredient, in order to prevent the creation of dust by motor and other vehicular traffic. The Hythe Town Council was one of the first to adopt the system, a good proportion of the roads of the Cinque Port being treated in this way. The question has now been raised whether the tar is not injurious to horses, and at a meeting of Hythe Corporation, on Tuesday, a letter was received from Mr. Cloke, the proprietor of omnibuses plying between Hythe and Folkestone, who stated that several of his horses were suffering from acute inflammation of the fetlock and the heel, and the veterinary surgeon called in was of opinion that the malady was caused by the tar on the road.

## CLUBS AND ASSOCIATIONS.

### AERO.

THE Aero Club balloon is in constant requisition, and three new members—Captain Corbet, Mr. J. Lyons Sampson, M.I.M.E., and Mr. Harry Brittain—ascended at Wandsworth on Saturday last with the Hon. C. S. Rolls, whose motor-car, with a party of friends, gave chase to the aeronauts across London. By varying the altitude slight changes of direction could be obtained with the balloon, and this made the motorists' task very perplexing. The river was crossed several times, once by ferry, and the balloon was lost sight of for a considerable period. Relying for their route chiefly upon the direction in which smoke was blowing, and the information of those who had seen the balloon, the motorists persisted in the chase, and the balloon was eventually run to earth in a field near Rainham, in Essex.

### WEST SURREY.

THE second annual luncheon of the Club was held at the Angel Hotel, Guildford, on Saturday, when members and guests to the number of fifty-six were present.

Rear-Commodore, Mr. W. Miall Green. The committee consists of the following gentlemen:—Viscount Royston, Lt. W. Windham, R.N., Lt. H. G. Vereker, R.N., Messrs. R. Haden Tebb, R. Denys Dundas, W. Lawrence, E. Owers, L. Stroud, A. G. Fentiman, F. Sims, S. Edge, C. Jarrott, Mawdsley Brooke, L. Miles, A. Kenealy, C. Cordingley, G. de H. Stone, E. Kenealy, A. Harden, H. T. Arnott, G. Neill, J. S. Holmes, F. C. Blake, N. B. Kenealy, F. B. East, Oswald B. Colls, and A. Lee Guinness. It was decided to form branches and affiliated branches in various parts of the United Kingdom. The statement of accounts showed the club to be in a very healthy condition. Racing will be held at Oulton Broad in June; Liverpool (in conjunction with Liverpool Bay Yacht Club), June 8th, 9th; in July a highly interesting event will take place, which will attract a deal of attention from both private owners, the trade and the public. In August races will be given at Cowes and on the Solent, when the Entente Cordiale Challenge Cup will be raced for and also most probably the Motorist and Traveller Challenge Cup. In September another three days' meeting will be held.

### EAST SURREY.

THE East Surrey Automobile Club held its annual general meeting at its headquarters, the White Hart Hotel, Reigate. Major Kingsley O. Foster, J.P., C.C. (president), was in the chair, the other members including Mr. A. Gunning Keen, Mr. H. Rosling, Mr. W. F. Garside, Mr. H. Hughes, Mr. G. H. Bowden, and Mr. D. J. Barry (hon. secretary). The annual report referred to much good work done during the year as well as to the social entertainments provided. The members

The Tyre Trials. The Three Cars Starting From Westminster. (See page 21.)

Colonel Fairtlough, chairman, presided, and a short toast list concluded the proceedings, the loyal toasts being followed by "The A.C.G.B.I. and Motor Union," proposed by Mr. Buttemer, hon. sec., and responded to by Messrs. Rees Jeffreys and Orde; "The West Surrey Club," proposed by Mr. Orde and responded to by Colonel Fairtlough; "The Guests," proposed by Mr. Pullman and responded to by Mr. Sparkes, and "The Chairman," proposed by Mr. Jeffreys.

The annual general meeting was held subsequently in the club room, those present including Colonel Fairtlough, Colonel Rawstorne, Messrs. Bryan Hook, J. Fletcher, Dr. Henderson, Dr. Fennings, E. G. Williams, R. Vogan, J. F. Ponsford, A. C. Tessier, F. Alder, J. F. Ochs, E. E. Pullman, A. King, St. J. Bashall, and R. W. Buttemer. The chairman gave a *resumé* of the club's work during the year, stating that it now numbered 71 members. The election of the committee for 1906 was then proceeded with, the nominations being Col. Fairtlough, Messrs. W. G. Crothers, J. F. Ponsford, A. C. Tessier, J. F. Ochs, E. E. Pullman, Dr. Mitchell, and R. W. Buttemer, all of whom were duly elected, the chairman, treasurer, and secretary being re-elected to their respective offices. It was also announced that the Hon. St. John Brodrick had been elected to, and had accepted, the presidency of the club.

### BRITISH MOTOR-BOAT CLUB.

THE annual general meeting of this club was held at the headquarters, Craven Hotel, Charing Cross, London, last week. The officers for the ensuing year were appointed as follows:—Commodore, Admiral Sir William Kennedy, K.C.B., Vice-Commodore, the Marquis of Ailsa,

now number fifty-three. The summary of accounts, which showed a balance of £30 15s. 8d. on the right side, was also presented and adopted.

On the motion of the Chairman, Captain Rawson was elected president, and the following were elected as vice-presidents for the ensuing year:—Sir A. Rendel, Sir G. Livesay, C.E., Major Kingsley O. Foster, J.P., C.C., Mr. H. Bell, Mr. H. N. Correllis, and Mr. J. B. Purchase. Mr. D. J. Barry was re-elected as hon. secretary and treasurer. The following were elected to serve as the committee for the ensuing term:—Messrs. G. H. Bowden, N. Colman, W. F. Garside, H. Hughes, A. Gunning Keen, H. Rosling, J. Underhill, C. H. Whittington, and J. Whittington.

At the conclusion of the ordinary business, Mr. Keen rose and said that the East Surrey Automobile Club was started with the idea of looking after the interests of motorists generally in that part of the country, and not so much as a social club or for arranging runs. They had communicated with the County Council and with the Local Borough Council with regard to dangerous places, and the former body had put up triangular boards at such spots. These boards were a great help to motorists, particularly to those who were strangers to the district. In that borough, however, there was not one that was of any use, and when they had asked to have them put up their request had been ignored. If one was to be put up it was to be erected at their expense. They had a certain amount in hand, but if the club did put up a triangle at its own expense the Borough Council would come down and ask why they had dug a hole in the side of the bank, and placed a board without rhyme or reason? A triangle was especially wanted at Buckland Corner, and one was also needed at the Angel, Woodhatch,

and at the top of the mill near St. John's Church. It was nonsense for their Borough Council to say they were to do it at their own expense, which they would be happy to do if the Council was willing to maintain them; and he, personally (if the club would not) would supply the triangles if the Council consented to supply the poles.

### SHEFFIELD AND HALLAMSHIRE MOTOR CYCLE CLUB.

THE second annual dinner of the Sheffield and Hallamshire Motor Cycle Club proved a successful meeting. The president, Mr. J. H. Hall, presided, and amongst others present were Mr. J. R. Kelley (president of the Leeds Motor Cycle Club). After the loyal toasts Mr. Kelley gave "The Sheffield and Hallamshire Motor Cycle Club," and pointed out that one of the main objects of the formation of clubs was to get rid of many of the penalties and restrictions whereby the law affected motorists. He congratulated the Hallamshire members upon their programme of last year, and spoke in favour of competitions giving members some incentive to excel as a great means of making their club a success. Motor-cycling he regarded as the most attractive of all sports, requiring skill, strength and intelligence by its devotee, and possessing that spice of danger which all Britishers love. He suggested the formation of a Northern Union of Motor Cycle Clubs. The London Union did not, he thought, pay sufficient attention to that part of the country. Mr. Kelley went on to urge instruction classes, lectures, and papers on matters connected with motors. He would also like to see inter-club runs between Sheffield and Leeds, and concluded with a few words of advice as to the way of increasing club membership.

Mr. J. Haslam, in responding, mentioned that when the club was formed eighteen months ago they had only six members. They had now sixty-five. He thought it likely that inter-club runs would be instituted. During the coming season they would have four competitions.

The President then made a presentation to Mr. J. Haslam as an acknowledgment of the appreciation of the members for his services as hon. secretary. Mr. Haslam suitably replied.

Dr. A. Forbes proposed the health of the president. Mr. J. H. Hall replied, and spoke of the necessity of an increase of members, which he thought ought easily to be forthcoming, seeing that there were over 400 motor-cyclists in Sheffield. He advocated the abolition of the speed limit, and favoured the institution of more competitions, as being to the advantage of sport. He also thought that there should be some sort of competition for ladies. He thanked them for drinking his health.

### ESSEX.

THIS club held its first annual supper and prize distribution, with Mr. W. H. Bishop in the chair, at the Crown Hotel, Ongar. The members went down by road, meeting at the Castle, Woodford. Thence they proceeded via Chigwell and Abridge to Ongar.

### THE MOTOR UNION.

THE General Committee of the Motor Union has elected the following automobilists to life membership of the Union:—Messrs. Charles H. Sample, Corbridge-on-Tyne; Norman Barker, Bowden, Cheshire; Edward T. King, Pulborough; R. Jackson, St. Helens; James Cooper, Scarborough; John Kennedy, J.P., D.L., London.

### SOUTHERN.

THE Southern Motor Club are organising an open event, which will take the form of a hill-climbing contest to be held on April 7th. This club has been most successful in all its club events, and the forthcoming contest will be of great interest to all motorists. Mr. H. Jones is the hon. secretary of the Sports Committee.

THE North-East Lancashire Automobile Club is arranging to establish a club-room for its members in Blackburn.

THE Essex Motor Club have had a most interesting lecture by Mr. H. Wyatt on "Magneto Ignition."

OWNERS of motor-cars as well as motor-cyclists are admitted to membership of the Sheffield and Hallamshire Motor Cycle Club, of which Mr. J. Haslam, 271, South Road, Sheffield, is the hon. secretary.

### MOTOR-CYCLING.

THE Motor Cycle Union of Ireland will hold the first of a series of speed trials at Portmarnock early next month.

Mr. J. van Hooydonk is now the trials hon. secretary of the Motor Cycling Club.

Motor-cycles will not be included in the annual hill climb of the Catford Club at Westerdam.

Mr. C. J. Eames, 97A, Caversham Road, Reading, is forming a motor-cycling club for the district; a similar organisation is in contemplation at Walthamstow. Mr. G. S. Blackledge, 17, Pretoria Avenue, Walthamstow, is the hon. secretary.

A committee of the Auto Cycle Club has been formed with a view to drawing up rules for a silencer competition.

### PUBLIC MOTOR SERVICES.

THE directors of the Isle of Wight Railway have under consideration the running of motor-omnibuses between outlying districts and rail-motors on the line. They are watching the experience of other people in that direction before embarking on experiment.

AT the statutory meeting of the Motor Bus Company, Limited, on Monday, Mr. Samuel Wheeler, the chairman, said with regard to their friendly alliance with the Vanguard and Arrow companies, a committee of the managing directors of the three companies had already met.

A SERVICE from Aberystwyth to St. David's, Haverfordwest and Tenby is about to be established by the West Wales Motor Company.

WITHIN three years the directors of the London General Omnibus Company expect to complete the substitution of motor-vehicles for horse-drawn buses on the main roads.

THE receipts from the motor-bus service at Eastbourne during January were £438, the passengers numbering 84,637.

THE Manchester District Motor Omnibus Company, Limited, has been registered with a capital of £300,000, and offices at 55, Bishopsgate Street Within, London, E.C. Mr. Daniel Boyle is the managing director.

IN consequence of the petition by the householders of Warwick Street, South Belgravia, against the use of that thoroughfare by motor-omnibuses, the General Purposes Committee of the Westminster City Council is recommending that a letter be addressed to the Commissioner of Police pointing out that the cars are a noisy nuisance and that the property on either side of the street is being damaged.

### CASE DISMISSED.

AT the Police Court, Dorking, on Saturday, William Rainforth, of 49, Grafton Road, West Acton, was charged with driving a motor-car at Mickleham at a speed or in a manner dangerous to the public. According to the evidence of four constables it was said that the defendant proceeded down a hill in Mickleham at the rate of thirty miles per hour. Two of the constables had stop watches by which they timed the defendant. One of the police officers asserted that three pedestrians had to swerve out of the road of the car and that a trap which was proceeding in the same direction had also to pull in to the near side of the road owing to the very furious rate it was alleged the defendant was proceeding down the hill. For the defence Messrs. Kenneth Brown and Co. called evidence to the effect that the police were wrong, that the car was proceeding at quite a normal pace down the hill, that instead of there being three pedestrians there were only two, and they had no occasion to get out of the road, or in the least to divert the course they were on, that the pedestrians took no notice. The Bench dismissed the summons, stating that they were satisfied that there was no danger to the public.

### CASES AGAINST MOTORISTS.

FRANCIS BRENNAN was charged before Sheriff Armour, at Cupar, with having, on January 27th, on the public road leading between Crail and St. Andrews, failed to stop his car when signalled to do so by James Clyde, who was driving a horse yoked to a van. After hearing evidence the sheriff found the charge not proven.

A VICAR's chauffeur, named Ernest Thorn, was severely punished by the Chipping Sodbury (Gloucestershire) magistrates on Saturday for driving at what one witness called the speed of an express train. The motor-car, in which were three ladies, collided with a farmer's cart, breaking the axle and pitching out the occupant, who, as he lay unconscious in the road, was told by Thorn, "It's no good to stop there being sulky." Having been previously fined at Bristol for reckless driving, Thorn was committed for three months' imprisonment with hard labour and without the option of a fine. He did not appear in court, and a warrant was issued for his arrest.

Place.	Summoned for	Result.
Chiswick ... ..	Dangerous driving	£5, etc.
" ... ..	Failing to stop car after accident	£5.
Lambeth ... ..	No light	£5, etc.
Brierley Hill ... ..	Dangerous speed	Pay costs—no conviction.
Chertsey ... ..	Two cases of reckless driving	£5 and £3 respectively.
Hailsham ... ..	No rear light	2s. 6d., etc.
Bow Street, London	Allowing visible vapour to escape from motor-car in St. James's Park	£3, etc.
Newcastle ... ..	Driving recklessly	£2, etc.
Guildford ... ..	No identification plate on motor-bicycle	10s., etc.
Edinburgh ... ..	Reckless driving	Not proven.
Cardiff ... ..	Excessive speed	Dismissed.
Newcastle ... ..	Dangerous speed	£2, etc.
Liverpool ... ..	Furious driving	Dismissed.

# THE Motor-Car Journal.

VOL. VIII.]

LONDON, SATURDAY, MARCH 17, 1906.

[No. 367.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

ON Saturday, the 24th, the doors of the Agricultural Hall, London, will swing open upon a most representative display of all that appertains to automobilism on land and water as well as in the air. From the list of exhibitors on another page it will be seen that all the great engineering centres will be represented, while fifty leading firms will testify to the progress which the British industry has made in the direction of supplying motor-vehicles for heavy traction, public services, commercial work and the like. The collection of pleasure and touring cars will be equally exhaustive. A very notable feature of the Continental section of the display will be the position attained by Italy, from whence will come half-a-dozen new types of cars that will reveal a workmanship and design surprising to those who have not previously recognised the development that is taking place in that country. Motor-boats, airships, etc., will add to the popular character of the Exhibition, while the meetings and conferences which have been arranged by the Motor Union and other associations will add to the importance of the Motor Week at the Agricultural Hall from the 24th to the 31st inst.

### The Stands.

FROM all we can learn the stands will be designed with more general excellence than in previous years. The scheme of lighting the Hall has been thoroughly reorganised and with the decorations will give quite a distinction to the building eclipsing earlier efforts in this direction. Now that the selling season is about to begin the opportunity of seeing the best cars on exhibition will be generally accepted, and a good attendance of the public is assured. Fortunately exhibitors at Cordingley's Show recognise the importance of being ready in good time, and it is expected that everything will be in order by 10 a.m. on the first day.

### Petrol Dangers in London.

THE London County Council is urging upon the Home Secretary the importance of giving effect to the recommendations of the Select Committee on Petroleum which appeared in the report issued in 1898. The Council draws special attention to an accident which occurred in Cornhill in October last, when a fire broke out on a steam motor-wagon containing a quantity of petrol, and points out that should such a fire occur in a narrow and crowded thoroughfare the result to life and property might be most serious. At the inquest into the cause of the fire which was held by the City coroner, the jury found that the accident was due to the ignition of spirit leaking from defective cans, and they added a rider to the effect that the carriage of petroleum through the streets should be further regulated. "The findings of the Select Committee above referred to," says the London County Council, "and the fires and accidents that have occurred from time to time, clearly

indicate that the powers conferred upon local authorities by the present Petroleum Acts are quite inadequate to enable them efficiently to protect life and property from danger arising from the use of petroleum and other substances of a like nature, and the Government is urged to introduce a measure for giving effect to the recommendations of the Select Committee, and for further regulating the conveyance of petroleum and other dangerous substances."

### Why be Bondsmen?

THE development of the automobile industry has rendered futile all efforts to make a ring around a section of the industry. Further, the division of the November exhibition into two sections has removed all necessity for The Bond which has again come in the spring time—an annual visitant to showrooms and offices. There will now be so much space available that the system of balloting will give no advantage, and will, in fact, not be necessary to the selection of those who may, and may not, show. Thus has the whirligig of time brought confirmation of the view of those who have held that in exhibition matters the equitable policy was the old British one of "first come first served." At the same time the small firms are being taxed unduly to provide the whole of the payment of spaces and Bonds when making application. This is an easy matter for wealthy men, but will operate harshly upon smaller firms engaged on experimental work and in the perfection of their product.

### Candidates and Motor-Cars.

AT the opening of the Glasgow Motor-car Exhibition the Marquis of Graham has been suggesting a new complaint with regard to the coming of the automobile. It appears to have made the work of Parliamentary candidates fourfold what it was in the good old days. In the times of the mail coach he was supposed to address one meeting on the hustings in the day; now he was expected to address four meetings a night for six nights a week, and then perhaps receive a first-rate thrashing at the end. This is an aspect of the matter that has not been put in quite that way before. But surely there are compensating advantages; and the outcome will ultimately be that motor-cars become recognised as such ordinary means of locomotion that voters will prefer to walk to the poll—by way of change.

### The Internal Combustion Engine.

ON the last two Thursdays in March and the first Thursday in April Professor Bertram Hopkinson, of Cambridge University, will give a course of lectures at the Royal Institution, on "Internal Combustion Engines," the interest of which will be enhanced by a series of experimental illustrations. The syllabus suggests some improvement in instruction at certain institutes where automobile instruction has been attempted. Starting with a discussion of the conditions of economical working in engines generally, Professor Hopkinson will proceed to the necessity of high initial pressure, and specifically deal

with the Lenoir engine and its defects. The second discourse will be concerned with practical methods of compression and expansion, stratification, the Otto and other cycles, throttling, pre-ignition, etc. We look forward to the third of the series, where possible developments with regard to gaseous fuel, petrol, and other oil fuels, and similar matters of commercial as well as engineering importance will be discussed.

#### A Prominent Irish Motorist.

AMONGST the many enthusiastic motorists in the South of Ireland is Mr. Richard Barter, J.P., of Cork, who is seen in the accompanying illustration at the side of his 12-h.p. Darracq. A noteworthy feature of the vehicle is the wind shield and canopy with which it is fitted, built in accordance with Mr. Barter's patented design. The shield or screen is of semi-circular shape, and consists of a narrow bent-wood frame, to which a large sheet of celluloid is fixed. The latter follows the curve of the frame, which is attached to the dashboard in such a way that it can be removed or replaced in one minute. The canopy is built up of short lengths of light copper tubing, which occupy a very small space in the car when packed, and which extend from each of the upper corners of the wind shield to the corresponding corner at the back of the tonneau, where they are met by upright supports of similar design. A roll of

waterproof canvas is carried on the car, ready to be quickly attached when desired to the top of the screen and extended over the supporting rods to the back of the car; curtains of the same material can also be fixed, thus converting the vehicle into a comfortable closed carriage. Another addition to the car is a foot warmer, connected to a simple coil of light copper tubing encircling the silencer, which gives the necessary amount of heat. Mr. Barter uses his car almost daily, and has made several extended tours on it in various parts of Ireland. He invariably drives himself, and he informs us that the vehicle is looked after entirely by a boy he has trained to the work.

#### The Motor Union and the Speed Inquiries.

THE report of the Motor Union to be presented at the annual meeting to be held at the Motor Car Exhibition at the Agricultural Hall, London, on the 28th inst., will be a record of increasing good work. The membership of the society is now 11,265. There are now 64 clubs and organisations included in its ranks, and the record of the speed limit inquiries during the year is proof of its value to the movement. Applications for restriction of the speed limit have been refused at Leeds, St. Albans, and Ealing. Suggestions for prohibition have been declined by the Local Government Board at Whitehaven, Torquay, and Horsham. A decision is still awaited with regard to East Retford, and the only places where limitations of speed,

other than those that are universal, can be enforced are the Anstey's Cove Road, Torquay; Middle Street, Horsham, and on certain roads in Kingston.

#### The "Vanguard" in France.

A REVIVAL of the glories of the coaching days is promised by the forthcoming thirty days' tour of the Vanguard motor-coach to the south of France. The vehicle will be specially fitted up for the tour, which will start from London on the 4th prox., proceeding to Newhaven, *via* Brighton, lunch being served at the old coaching inn the "George" at Crawley. Arriving at Dieppe the interesting run will be continued to Rouen, Chartres, Orleans, Bourges, Lyons, Valence, Avignon, Arles, Marseilles, Toulon, St. Raphael, to Nice. A week will be spent at Nice and Monte Carlo, the motor-coach being available for the service of passengers during the stay. From Nice the homeward journey will be taken through Nimes, Le Puy, Moulins, Nevers, Montairs, to Paris and Dieppe, arriving in London on May 3rd—altogether a picturesque trip.

#### Balloon v. Motors.

A LARGE number of motor-cars assembled at Wandsworth Gasworks on Saturday afternoon in connection with a balloon ascent. At three o'clock the Aero Club balloon, Vivienne III., soared aloft, carrying Mr. J. Moore-Brabazon, Mr. Warwick Wright, Mr. Howard Wright (who was making his first ascent), and the Hon. C. S. Rolls. Despite the inclement weather several of the cars started in pursuit of the balloon, which moved away slowly in a north-north-easterly direction, passing over the Serpentine and Marble Arch. At this point the balloon entered the clouds and was lost to sight, some of the motorists giving up the chase as hopeless. Two of the cars, however, kept on, and had the satisfaction of seeing the balloon appearing out of the clouds just above them, in the neighbourhood of Tottenham. Signalling commenced between the occupants of the car and the balloon, which was then only 1,000 ft. high. It being about half-past four, hopes were entertained by the motorists that the balloon would make its descent, and that they might still have a chance of effecting a "capture," but the country being too closely populated for the aeronauts, the balloon rose again and remained in the clouds for half an hour, thus completely baffling the motorists, who gave up the chase at Waltham Cross, and returned disappointed to town. Had they gone a little further they would have "found," for the aeronauts descended at Hoddesdon, four miles from Hertford, in the grounds of High Leigh, the seat of Mr. Barclay, who kindly invited the balloon party to tea. The maximum height attained during the journey was 3,700 ft., at which altitude snow was falling very heavily, while at the lower level rain fell continuously, but the aeronauts themselves were able to keep perfectly dry and comfortable throughout the trip, the balloon forming, as it were, a huge umbrella above them. The average speed attained was ten miles an hour.

#### Churches as Garages.

SEVERAL buildings, formerly devoted to the purposes of religion, are now being used as motor garages. At Towcester, Mr. Victor Ashby stores the motor-cars of visitors in what was once a church; now a church at St. Albans has been converted into a motor garage and has been opened by Messrs. Giffen and Tilley as the City Motor and Electrical Works. So far as alterations to the old building are concerned, the front has been remodelled. A spacious double-fronted window has been inserted. The wall above the window has a cement dressing, which throws into bright relief the smartness of the shop underneath. Inside, nothing but the floor remains of the old parts. The ground floor serves as both a show-room and garage, and, with the exception of a small piece at the back, used for office purposes, extends the whole length of the building. The whole extent of the lower floor, which is the

old schoolroom, is the other "stable," and in this are also erected the work benches. Perhaps some of our readers when on tour may be able to discover other instances of the changes wrought by the whirligig of time.

#### Automobile Club Trials.

THESE trials of speedometers, tyres, lamps, etc., have been proceeding during the past week, but comment on the performances may fairly be left over till the official records of the judges have been obtained and compared. What would ordinarily have been a dull day in connection with the Automobile Club trials on Monday was enlivened with a scene upon the Oxford road in which the motorists played the part of spectators, while horse folk acted the comedy. The day's run was from London to North Leach and back (165½ miles), and when six miles from the turning point the occupants of one of the cars came across a two-horsed market cart left unattended outside an inn. In the near vicinity also was a countryman mounted on a horse. On the approach of the car all the horses bolted, the draught horses making diagonally across the road, and very nearly colliding with the motor. The-

the sins of the motor-car, and we trust his assurance that the question will be fairly dealt with when the general question of local taxation is considered may be regarded as indicating a readjustment of taxation on equitable lines. In view of the advantages secured by the automobile and the convenience it is proving to many public interests, there must be no imposition of new taxes on those who own cars.

#### "No Lights."

A CURIOUS point in connection with the Motor Car Act has arisen at the North London Police Court, where a motorist was summoned for (1) having no lights on his vehicle, and (2) for not illuminating the identification plate in the rear of his car. Evidence proved that the defendant had made a call and had left the car for twenty minutes in a well-lighted spot, where the absence of lights on the car itself could not become a public danger. Before proceeding on his way he relighted the lamps—the lights had been put out when the car was stopped. But a constable issued a summons, which, as the magistrate rightly said, should not have been taken out. Such a case, if brought before the courts at all, ought to have been regarded as a

Photo by]

The Tyre Trials. The Cars at Daventry.

[Agent Archer.

driver of the car immediately pulled up, while the horses continued to career along the road. In a couple of hundred yards the girth of the single horse broke, and the rider was precipitated into the mud. The car then drove up, and took the rider on the footboard to give chase to the runaway team. They were all but overtaken, and the horseman thought he would dismount to effect their capture, but having only a rare acquaintance with motor-cars, misjudged the pace, and was again brought headlong to the mud-smeared mother earth. Not to be beaten, he took a short cut across some fields, and heading off the unruly animals, took them safely back to their owner. No serious damage was done, and everyone took the whole affair in good part.

#### The Upkeep of the Roads.

SEVERAL M.P.'s are determined to press the Government with regard to throwing the whole or some part of the upkeep of main roads on the Imperial Exchequer, instead of, as at present, on the local rates. Mr. Ashley, the representative of Blackpool, has founded a question on this point calling attention to the increase in both light and heavy motor-car traffic. Fortunately Mr. Asquith, who is himself a motorist, is not likely to wholly ascribe the wear and tear of the roads to

case of obstruction. Fortunately the motorist was able to plead before a magistrate with a sense of equity.

#### Flying Machines.

IN view of the interest that attaches to aeronautics we would refer to the paper by Mr. F. W. H. Hutchinson, read before the Cambridge University Engineering Society, on the experimental flying machine model made by himself in conjunction with Mr. E. P. Frost and Mr. C. R. D'Esterre. This was based upon the principles involved in the flight of birds, and a systematic continuation of their line of work would be of much scientific value. As Mr. C. G. Lamb, M.A., the University lecturer in Electrical Engineering, has pointed out, the apparatus which has been designed seems well adapted for further experiments. With but little improvement it should be capable of being used to discover many of the required data to bring the matter to a successful issue. We understand that the experiments are now at a standstill pending the co-operation of other gentlemen interested in the subject who would be disposed to render financial as well as practical aid. Mr. Hutchinson has devoted considerable time and study, and he is to be congratulated on the unique character of his work.

**Looking after Motorists.**

WITH the strange name of the Shropshire Motor Protection Association a society exists in the Midlands with the avowed object of prosecuting motorists who exceed the limit of speed in that region. The annual meeting was held at Shrewsbury on Saturday. Mr. John Hill, of Church Stretton, the president, said at the appeal of the association the County Council had put up warning signals at some of the most dangerous corners on the main roads, and these had added considerably to the safety of people who used the roads. There was room, however, for further development in that direction. One accident, at least, might have been avoided had there been a signal post at the spot. He impressed the fact that the association was not antagonistic to motorists generally, but only to those who declined to consider the safety of the public and to obey the recognised rules of the road.

**Motor-Car Imports and Exports.**

THE importation of foreign motor-cars into this country continues on an exceedingly large scale, the returns for February showing a total of 530 vehicles of a value of £211,824. To this have to be added parts to the extent of £184,598, giving an aggregate of £396,422, a total which has only once been exceeded, and which compares with £311,990 in the previous month and £252,751 in February, 1905. A slight gain is also noticeable in the exports of British motor cars and parts, last month's total—which comprised seventy-two cars and £19,838 of parts—being returned at £39,331, as against only £26,544 in the corresponding month of last year.

**The Infallible Police.**

EVIDENTLY the authorities are recognising that the police are not infallible, and the new Order to the Metropolitan Police (already dealt with in these columns) is not the only significant sign of the shadow of doubt which is passing over their evidence. The Chairman of the Northumberland Quarter Sessions and the Chairman of the Lancashire Main Roads Committee have been giving sage advice to the police of their respective areas, and pointing out that their duties are not primarily concerned with the capture of motorists in traps. They are the guardians of property and the person; the searchers after criminal ill-doers, and the guardians of law and order. Such work can be performed without showing vindictiveness to those who use the highway—a fact which seems to be dawning into the intelligence of some of the rural police stations.

**Traffic in London.**

ATTENTION is being bestowed upon London traffic, the magnitude of which is brought clearly before the authorities by the further reports of the Traffic Commission, which have been issued recently. Some idea of the extent of this may be gleaned from the fact that within a radius of ten miles from the office of the *M.C.J.* there is a population of 4,880,460 persons, while a circle of twenty miles diameter with the same centre would include 6,696,284 persons. The internal passenger traffic of Greater London has increased to nearly 140 journeys per head of population. It is calculated that the omnibuses of Greater London carry as many passengers as all the local railways put together, and the tramways 50 per cent. more. The omnibuses of London carry numerically in one year the whole population of the United Kingdom seven times over. If the various motor and horse-drawn 'buses engaged in the streets of London could be placed end to end they would reach sixteen miles—from Charing Cross to Staines. There are twenty-nine different omnibus routes through Oxford Street to different parts of London. From the Strand the Londoner can get to twenty-three points of the City, from Whitehall to twenty-two, and from Piccadilly to eighteen. Motor-'buses hold thirty-four persons, as against the horse 'bus's load of twenty-six, so that when horse 'buses in London are replaced by motor-'buses,

the streets will be relieved of one-quarter of their existing omnibus traffic.

**Police v. Council.**

BECAUSE the police authorities of the town of Retford did not see their way to join with the Council in a war against motorists a worthy alderman of that town has thought well to denounce their attitude at a Council meeting. There was recently a Local Government Board inquiry as to the speed of motor-cars in the town, and, according to Alderman Bescoby, the Chief Inspector of Weights and Measures for Notts. thought it necessary to leave his important duties to give evidence against the Retford Corporation. He (the speaker) should like to know whether he came with the consent of his authority or out of "sheer cussedness." They contributed a fair quota to the salaries of men like the Chief Inspector and the Chief of Police, and were entitled to the assistance of the police whether it was asked for or not. He thought it was the duty of the police to attend to the regulation of the street traffic just as they looked after thieves and poachers. Certainly; and at Retford they can do that without aldermanic assistance.

**Cycling and Motoring.**

THE decreasing membership of the Cyclists' Touring Club is perturbing the minds of the leading officers of that organisation, who recognise that the growth of motoring has had much to do with the changed order of things. At the same time, cyclists and motorists have much in common; both are interested in obtaining good hotel accommodation on reasonable terms, in improving the surface of the roads, in the warnings as to dangerous corners, and such like matters. Apparently the desire to extend the scope of the club, and include all interested in travel, will find expression in the postal vote now being taken on the subject.

MR. N. D. MACDONALD will read a paper on motor services in relation to tramways, at the Society of Arts, on the 27th inst.

THE chassis driven by Mr. Frederic Coleman in the Tourist Trophy race has been sold to Messrs. Liberty and Co. fitted with a van body, to which further reference will be made next week.

THE Aero Club of the United Kingdom have provisionally selected Professor Huntington, of King's College, Mr. Frank Butler, and the Hon. C. S. Rolls to compete as the representatives of this country in the race for the Gordon Bennett (Aeronautical) Cup.

MESSRS. MOSS AND WOODD inform us that their lawsuit with the London General Omnibus Company, which has been dragging on since last June, and in which they were the plaintiffs, has been satisfactorily terminated without going into Court by the London General Company withdrawing all imputations made against the "Orion" chassis.

WE hear that one of our leading motor experts is building a gearless car—that is, a vehicle in which change-speed gearing is entirely dispensed with. It may be remembered that Messrs. Charron, Girardot and Voigt built such a car, with an eight cylinder engine, and that the same was exhibited at the Cordingley Show at the Agricultural Hall in March, 1903.

A NEW depot and show room has been opened by Messrs. Frank Little and Co. in the Westgate Road, Newcastle. The Mayor of Newcastle, Alderman J. Baxter Ellis, was present at the formal ceremony, and expressed the opinion that the time had arrived when tradesmen who wished to be up-to-date must have something a good deal faster than horse traction. After reference to Mr. Little's business tact and courtesy, his Worship proceeded to say that there was one thing which extremely delighted him, and that was this, that although the motors were not being manufactured in Newcastle, the bodies were being made by coachbuilders in the city, and he believed the day was not far distant when everything in connection with the motors, both for pleasure and business, would be made in Newcastle, which was the birthplace of engineering.

## THE EMISSION OF SMOKE.

### SOME SUGGESTIONS FOR ITS PREVENTION.

By A. E. S. CRAIG.

SO important do I consider the question of lubrication in connection with smoke abatement, that I would first like to briefly summarise the gist of what I have already tried to point out when recapitulating, in some articles entitled "The Trail of the Unconsumed," the *pros* and *cons* of the various systems. My argument in chief is that the ideal method of lubricating a motor is one that shall be, as far as possible, fool-proof. It must automatically start and stop, and feed in ratio to the speed of the engine. Once properly regulated, it must deliver measured doses of oil to the parts requiring lubrication as directly as possible. The splash system alone is too crude to allow of that nicety of regulation which can be obtained by other methods. Sight feeds by gravity and pressure require too much continual and intelligent attention to attain and keep any approach to perfection in the hands of the average motor-omnibus driver. This leaves us with the choice of various systems of mechanically-worked and measured feeds, such as pumps and dredgers of different pattern, and here lies the direct and only road to true economy and efficiency, and the reduction to the smallest limits of error—*i.e.*, that fatal margin, which results in clouds of filthy smoke on the one hand, and serene inoffensiveness on the other.

A few words on the question of explosive mixture. There is some degree of truth in a remark I read in an article on carburettors to the effect that "an automatic carburettor is one which gives an imperfect mixture at all speeds." Now, as air does not yet have to be purchased from the London County Council in two-gallon cans, it seems a pity not to burn as much of it as we are able, and there should be no real objection to having, in addition to the most automatic of carburettors, a supplementary hand air control. With this control placed conveniently to the driver, and a bonus paid to him weekly in proportion to the economy of petrol as against his way bill, we should hear no more about too rich mixtures or of the emission of smoke. The occasional annoyance caused by oil getting on to the exhaust pipe is sufficiently rare, and the remedy so obvious and simple, that the drivers should have no difficulty in dealing with it.

But, assuming that all this is correct—lubrication well regulated and the mixture suitably adjusted—I regret that I do not share the sanguine opinions which are constantly vouchsafed to the effect that all that can be necessary is thereby attained. Unprejudiced people must allow that, although invisible to the eye, and although to a great extent the public may become habituated to the odour, it is still there; every motor sends out its hot, pungent gases, and I predict that, in the no distant future, even this will have to be stopped, or at any rate modified, till "the man in the street" enjoys a much greater degree of olfactory tranquillity than at present.

Take the ordinary exhaust box; it deadens the sound more or less efficiently, but the smoke that goes in runs its little obstacle race, and running out again, meanders down the street, whilst the pungent titillating odours are not checked in the smallest degree. The question of how to modify this state of things may not be so complicated after all; but I hold that the difficulty must be taken in hand at both ends. We must, by proper systems of lubrication, as opposed to oil drenching, and by the consumption of more oxygen, minimise the amount of nuisance to be dealt with as much as possible. For it is obvious that the smaller in quantity the unconsumed products we have to deal with, the smaller and less complicated will be the apparatus required to arrest and absorb them.

In a small and spasmodic way I have conducted some experiments to see how simple such apparatus can be. For this purpose cylinders were made with inverted V troughs running from end to end, their serrated edges dipping into a solution of chemicals. An engine purposely over-lubricated, and further smoke evolved by injecting oil into the hottest part of the exhaust pipe, was coupled up to the contrivance. There was very little

back pressure, as the level of the liquid was kept practically at the height of the trough's edges. The exhaust came out absolutely cold, the pungent irritating odour was killed, and a great deal of the smoke absorbed. Another pattern, consisting of super-imposed trays of wire netting, about five mesh, was next tried. Each tray was covered with small pieces of coke; the smoke was caused to enter at the bottom and percolate upwards whilst liquid was sprayed from the top. This pattern also gave fairly encouraging results, the exhaust being quite inoffensive and in the nature of a cold fog, which did not rise.

As on a car only a limited amount of water and space is at disposal, several difficulties present themselves. The liquid must be kept cool, and its bulk must be no more than absolutely necessary. To keep down the temperature, of course, circulation and radiation are indicated, and to reduce the size of the apparatus the scrubbers must be so designed as to allow the greatest quantity of gases to pass without back pressure through only as much liquid as is sufficient to achieve the object. And, in order to deal with occasional clouds of heavy smoke more thoroughly, it might be advisable to first pass the exhaust into a dry filter chamber containing charcoal or other suitable absorbent. The final exit of the gases, moreover, which will

A Motor-Car Accident at Fulwell.

A peculiar motor-car accident occurred at Fulwell, near Bushey Park, on Tuesday last week. Two cars, owned respectively by Col. Fowle, of Hounslow, and Mr. H. O. Mack, of London, S.W., were proceeding along the road in the direction of Hampton Court and Staines respectively; they both reached the point where the main roads cross one another simultaneously, and in trying to avoid a collision they dashed into the ditch side by side, smashing down the signpost and hedge. The only occupants of the cars were the drivers, neither of whom was injured. The cars were considerably damaged, and had to be removed on lorries.

probably leave the scrubbers in a steamy fog, might be further condensed by being made to travel along gilled pipes. Of course, an entirely different remedy may be sought by killing some of the products by intense heat, causing the exhaust to be passed over highly incandescent fuel, or material, and injecting air to aid the complete combustion of any unconsumed hydrocarbons.

MESSRS. R. MORTON AND SONS, LIMITED, of Wishaw, N.B., the makers of the "Morton" commercial vehicles, are opening a depot and repair works at 42-50, Bridge Street, Glasgow.

THE motor-cycle section of the Austrian Automobile Club proposes to alter the date of the international motor-bicycle race from June 29th to July 8th. Germany is stated to have already agreed to the change.

At the Grove Hill, Harrow, a little comedy is being played between the police and an unknown humorist who, objecting to the presence of the sign warning motorists to moderate their speed, has broken the top portion and substituted a dummy officer.

## SOME CURRENT TOPICS.

### The Word "Cardan" and Its Origin

The phrase "cardan shaft" is now a familiar one in motoring circles, but there are few, we imagine, who know the origin of the word "cardan," and it has been left for M. Baudry de Saunier to give the information in the new French automobile journal, "L'Omnia." "Cardan," it transpires, is the French equivalent of Cardano, the name of an Italian engineer who invented a shaft with universal joints early in the sixteenth century. Such shafts have become known in France as *arbres a la Cardan*, from which the translation cardan shaft is an easy step. While dealing with the question of the origin of words, reference may be made to the word "carter," now commonly used

line, of the department of electrical engineering. The first will comprise a comprehensive study of the various forms and makes of ignition apparatus now on the market, such as high and low-tension magneto systems, sparking plugs, coils, batteries, and the like. In conjunction with this there will be carried on an investigation comprising a series of tests to determine the limitations of, and, if possible, the ideal conditions for ignition. Variations of capacity, inductance, current, potential, compression, and quality of the mixture will be made, and the effect of these variables studied. If possible, a comparison will be made with the ideal conditions in order to demonstrate clearly in what elements the shortcomings of present systems are centred.

### Instruction Books.

A noticeable improvement in the automobile movement, which will conduce to the mutual advantage of user and manufacturer, is the helpful instruction books which are being furnished to purchasers of modern cars. Until a year or so ago

The Difficulties of Motoring in Russia. Count Potocki's Mercedes on a Bad Road at Schepetowka.

[Allgemeine Automobil Zeitung.]

in France with the meaning of gear case. It is not generally known that it is derived from the name of Mr. Harrison Carter, the inventor many years ago of the gear case to enclose the driving chain of a bicycle. Thus France has converted the names of both an Italian and an English engineer into common nouns to designate the articles they invented.

### Experiments with Ignition Apparatus.

Having completed the installation of its motor-car testing plant and put it to work, the authorities of the Purdue University, at Lafayette, Ind., U.S.A., are about to undertake another branch of investigation in connection with the automobile, which should be productive of great practical results. There has long been a real need of some experimental knowledge of the requirements for igniting the fuel in the cylinders of the internal combustion engine, and it is interesting to learn that two series of investigations are about to be undertaken at the University, both of which will be in charge of Prof. J. W. Ester-

there was a lack of definite information furnished the owners of vehicles relative to the lubrication of their cars, the adjustment of parts, and the derangements to which the various portions of the mechanism are likely to be subject, and their remedies. Some of the larger and older manufacturers have long furnished books of directions which were valuable in that they contained matter which was the result of the experience of a great many users, and thus laid due stress upon the points which service had demonstrated to specially require elucidation; but many of the smaller and newer concerns have naturally been unable to furnish as satisfactory and useful directions to their patrons, on account of the somewhat untried character of their product and the experience necessary to demonstrate what particular matters the instructions should include. The tendency which formerly seemed to exist to allow the user to find out through experience what might better have been told him in the beginning appears to have passed away with the growth of the spirit of candour in the industry, and now the instruction books generally contain

particular advice as to the peculiarities of the cars to which they refer, and are written in a lucid and comprehensive way with diagrammatic illustrations which cannot fail to lead to a more intelligent use of the car by its owner and a better *entente* between the manufacturer and his patron.

#### Silent Cars.

Times have changed since the days when the average owner of a petrol car did not seriously object to the noise it made. Now he demands a silent vehicle—silent, that is, by comparison with the thunderous, nerve-racking machines which a few years ago were the rule rather than the exception. The motorist who gauges his pleasure by the volume of noise emitted from his silencer has, however, not wholly passed away. Some extremists of this type will even cut out their silencers in order to give the public the full benefit of the exhaust from the engine, with the result that may readily be imagined. But they are in a decided minority, a minority which steadily decreases. It does not take any abnormal amount of discernment to see that the time is likely to come when people of this class will execute a *volte face* and go in for silence quite as strenuously as they formerly did for noise. At the present time nearly all cars have undergone improvement in this respect. Designers and makers have been quick to see that the public wanted quieter vehicles, and as they know full well that quiet cars mean efficient cars, and that in following the present fashion they are pursuing the logical line of development, the progress made in this direction is not surprising. In minimising noise power is conserved and used in propelling the vehicle, instead of being wasted; for it has become an axiom that noise is power diverted from its proper use. Sensitive people like neither noise nor its concomitant, vibration. With them the highest possible praise of a petrol car is to say that it is as quiet as a steam or an electric vehicle, and motorists who have once experienced these qualities are never content to take a backward step and return to the old order of things.

#### Calculating the Horse-power of Petrol Engines.

Glancing through the recently-issued catalogue of the "Scout" cars built by Messrs. Dean and Burden Bros., Limited, Salisbury, we came across a simple and handy method of calculating the horse power of petrol motors, which we deem worthy of reproduction in our columns, as the firm inform us that it can be relied upon to give the power within a small limit of error, at any bore, stroke, or reasonable speed, provided the compression before firing is somewhere in the vicinity of 70 lb. to the square inch. The method is as follows:—If the bore and stroke of the cylinder is given in inches, multiply the bore by the bore by the stroke by the number of explosions or impulses per minute and divide by 6,500; this will give the horse power. Taking a four-cylinder motor running at 1,200 revolutions per minute, the number of impulses would be 2,400. A two-cylinder motor at 1,200 revolutions would give 1,200 impulses, and a single cylinder at 1,200 revolutions would give 600 impulses. If the bore and stroke is given in millimetres, multiply the bore by the bore by the stroke by the number of impulses per minute and divide by 110,000,000. Take for example the "Scout 17-20-h.p. four-cylinder motor bore and stroke—90 by 115 millimetres running 1,200 revolutions per minute equals 2,400 impulses. Bore 90 by 90 by stroke 115 by explosions 2,400 divided by 110,000,000 equals 20½-h.p. Take again an engine having two cylinders 4 in. by 4 in. at 1,200 revolutions per minute—bore 4 by 4 by stroke 4 by explosions 1,200 divided by 6,500 equals roundly 11½-h.p.

WITH a capital of £1,000 Auto-Mixte, Limited, has been registered.

MR. G. W. BURNELL is closing his motor garage in Albion Street, Rugeley, and intends to devote his whole time to the cycle trade in future.

THE Victoria Cycle Company, Limited, have taken depots in the Royal Exchange Place, Glasgow, and Bridge Street, Aberdeen, where they will set up considerable garage accommodation and extensive repair works.

## THE MERCEDES SIX-CYLINDER ENGINE.

—1—

IT has already been hinted in the *M.C.J.* that the 1906 Mercedes racing cars would be fitted with six-cylinder engines, so that the news that such a motor is now in existence will not come altogether as a surprise. We are indebted to the "Allgemeine Automobil Zeitung" of Vienna for the accompanying illustration and details of the new engine, which, it is stated, has only been adopted by the Daimler Motoren Gesellschaft of Unterturkheim, Germany, for its 1906 racing cars, on account of the saving of time it affords owing to it being unnecessary to change the gear so frequently. The engine, which is normally rated at 120-h.p., is entirely a new departure for the Mercedes designers, the cylinders being separately turned from steel, with water jackets of similar metal. The valves, both inlet and exhaust, are operated by means of rocking levers actuated by an overhead cam shaft, the latter being driven off the engine shaft through a vertical spindle and bevel gearing at the front end of the motor. To prevent any chance of leakage the inlet pipes are provided with expansion joints, while each cylinder has a separate exhaust

View of Inlet Valve S.de of Mercedes Six Cylinder Engine.

pipe, which is connected up to a collector, from whence the burnt gases pass to the silencer proper. Another new departure is the adoption of high-tension magneto ignition with sparking plugs in place of the low-tension make-and-break type.

A TWO-CYLINDER 10-12-h.p. Argyll car in the service of Messrs. Hardy, Robson and Co., of Newcastle-on-Tyne, has accomplished 40,000 miles, and is still in a most serviceable and reliable condition.

SHOCK absorbing devices have lately been brought out in America at an astonishing rate; in fact, there would now appear to be as many different forms as there are makes of cars. It is therefore not surprising to learn that actions for alleged infringements of patents are already in the air.

MR. R. M. WRIGHT, of Lincoln, who recently completed a 5,000 miles reliability trial on a 10-12-h.p. Coventry Humber car, has acquired a spacious building adjoining his present depot and workshops for the purpose of opening an up-to-date motor garage. It is Mr. Wright's intention to have the garage ready by the end of the month or the early part of April, and when completed it will be one of the largest in the county of Lincolnshire.

## CONTINENTAL NOTES.

### Public Services in Germany.

A company has just been formed in Blumenthal (Hanover) to establish a motor-bus service between Vegesack and Vorbruch. Two 32-h.p. twenty-four seated vehicles have already been ordered from the Sud-Deutschen Automobilfabrik, of Gaggenau. Arrangements are in hand for the inauguration of a service between Rottweil and Schramberg. In Munich a company has been organised to place a number of motor-cabs in service in the town.

### The Swedish Reliability Trial.

As mentioned in a recent issue, the 500 mile reliability run from Gothenburg to Stockholm, recently held by the Swedish Automobile Club, resulted in a victory for the 24-h.p. Fiat,

tively slow, but forty kilometres were completed in record time, the pace being kept up till the end, with the following results:—

	New Record.	Old Record.
One hour ... ..	59 3-16 miles.	56 7-16 miles.
100 kilometres ... ..	1 h. 3 min. 52 1-5 sec.	1 h. 6 min. 36 2-5 sec.

Later in the day Anzani, on another Alcyon machine, endeavoured to create a new record for the over 50 kilog. class. Unfortunately rain fell and rendered the track somewhat dangerous, with the result that, after covering several laps at the rate of 106 kilometres per hour, his machine skidded, bringing the rider to the ground with a thud. Fortunately he escaped without serious injury.

### The Prunel Motor 'Bus.

A 24-h.p. thirty-six seated motor-bus, which has just been completed by the Usines Prunel, of Puteaux, was subjected to a trial run from Paris to Rouen and back one day last week. The new vehicle is being despatched to London for exhibition at the Agricultural Hall Show.

A Motor-Cab Stand on the Grand Boulevard, Paris. The vehicles, which were built by the Renault Company, belong to the Compagnie Generale des Petits Voitures, and are fitted with Taximeters.

driven by Mr. G. Salmson. Mr. H. Dahn, on a 12-h.p. Darracq, was second; M. Bagge, on a 7-h.p. Star, third; and Mr. P. Bjorkman, on a 7-h.p. Oldsmobile, fourth.

### New Motor-Bicycle Records.

A series of record-breaking trials were carried out on the Parc des Princes track in Paris last week end. Thomas, riding an Alcyon motor-bicycle fitted with Buchet 76 mm. by 73 mm. engine and chain drive, first attacked Cissac's (Peugeot) record for third of a litre machines, and succeeded in setting up new times as follows:—

	New Record.	Old Record.
One hour ... ..	57 1/4 miles.	56 1/4 miles.
100 kilometres (62 1/4 miles)	1 h. 5 min. 27 1-5 sec.	1 h. 6 min. 46 4-5 sec.

Thomas got inside the record at ten kilometres, and held his position to the end. Next a rider named Pernet, using an Alcyon machine with Buchet 90 mm. by 90 mm. motor, attempted to lower the record for the under 50 kilog. class held by Giuppone (Peugeot). The first thirty kilometres were rela-

### A Smoke Prevention Competition.

At the last meeting of the Touring Committee of the French Automobile Club the question of the emission of smoke from the silencers of petrol cars was considered, and it was decided to organise a competition of apparatus to prevent the same.

### The "Elastic" Wheel Competition.

The competition of "elastic" wheels for motor-cars, which is being organised by "L'Auto," is fixed to take place from the 17th to the 26th April. The contest will be divided into two classes, each of which will be subdivided into two categories. Class 1 will comprise wheels in which the tyre is of elastic material, the part of the wheel between the hub and the felloe not being elastic. Class 2 is for spring wheels—that is to say, wheels in which the part between the hub and the felloe is elastic. In each section the two categories are:—(a) for cars the engines of which have a maximum piston surface area of 314 sq. centimetres, and category (b) for cars the engines of

which have a maximum piston surface area of 490 sq. centimetres, the maximum weight of the car and its load being respectively 1,500 kilogs and 1,800 kilogs. The trial will consist of a run from Paris to Nice and back, the total distance—2,128 kilometres—being divided into eight daily stages ranging from 220 to 316 kilometres. The entry list will close on the 31st inst.

#### The Nice Week.

Owing to the bad state of the roads and the paucity of entries, the mile speed trials fixed for the 29th inst., and La Turbie hill-climbing competition, which was to have been held on the 31st inst., have been cancelled.

#### The Targa Florio.

The race for the Targa Florio, to be held in Sicily on May 6th, promises to be a great success, numerous entries having already been received. The event is confined to touring vehicles of a chassis cost of less than £800, and of types of which a series of not less than ten must have been constructed before the date of the closing of the entry list. The contest is to be held over the 100-mile circuit, to be covered three times, shown on the accompanying map. The Chevalier Vincenzo Florio, who has recently

The Targa Florio Circuit on the Island of Sicily.

been over the route, reports that from Cerdà to Caltavuturo the road is excellent, but soon after passing the latter place, notably between Petralia and Castellbuono, where the road attains an elevation of 4,600 ft. above sea level, the surface becomes bad. From Castellbuono to Campofelice it is fairly good, but poor between the last-named place and Cerdà.

#### A Hill-Climbing Competition near Marseilles.

The "Provence Sportive," of Marseilles, is organising a 500 metre hill-climbing competition, to be held on the Platrières Hill, near Aix-en-Provence, on May 20th next. The contest is open for all classes of touring motor vehicles.

#### Miscellaneous Items.

A Renard road train, consisting of a Serpollet steam tractor, two fifty-seated passenger cars, and a 3½-ton lorry, has just been completed for a service in Persia.—It is reported that a French motor-car company is about to establish a branch factory near Madrid.—Four machines, three Adlers and a Progress, have been entered for the German team for the International Motor Bicycle race.—It is reported that Madame du Gast, the well-known French sportswoman, has been captured by brigands in Morocco.—The "Auto" is organising an automobile excursion from Paris to the Sarthe Circuit for the 17th and 18th inst.

## USEFUL NOTES.

MOVING the steering wheel while the car is at rest tends to unduly strain the joints between the wheel and the front wheels. Of course, there may be cases when it is difficult to avoid moving the steering while the car is at rest, especially when turning in narrow roads; but as far as possible the rule should be adhered to of never forcing round the steering until the wheels are moving.

AFTER using a car for a long time a motorist becomes very sensitive to any change in its running conditions, both as to variations in the sound of its operation and its motion. A squeak, due to some unlubricated part, is very sure to be detected, and the sensation due to the car running on a flat tyre is not likely to elude the driver's attention for any great distance. He will also very quickly notice if any one of the feeds of the sight feed lubricator ceases to work and will be quick to detect any change in the working of the water circulation indicator, if one is used, and no conscious attention, practically, is required to attend to these matters, the care which is shown for them becoming entirely involuntary.

MOST petrol engines are provided with carburettors which depend for their best operation upon heat derived from the motor. Either the carburettor is jacketed with water from the cylinder cooling system, or the supply of air to form the mixture is drawn from near the exhaust pipe. Until the engine has been running for a little time these sources of heat to be supplied to the carburettor do not materialise, and not quite so perfect a mixture is at first delivered to the motor, which has a corresponding effect upon the power developed. Under certain conditions, when a motor is started very cold, there may be more or less recondensation of petrol in the induction pipe, preventing the development of full power, but this condition is soon overcome by the running of the engine.

WHEN the car is to be brought to a stop it is unnecessarily hard upon the brakes and other parts of the car mechanism to drive up with full power to the stopping point and then to apply both brakes suddenly. It is far better to disengage the clutch some little distance before the stopping point is reached, when the car will slow down, but little braking effect being necessary to stop it exactly at the desired point.

IN attempting to take off a cylinder head never drive any kind of tool between the cylinder and head.

SLIPPING in a leather-faced clutch may be due to want of adjustment, and consequently remedied by tightening up the clutch spring. Very often slipping is due to the presence of grease, oil, etc., on the leather, in which case the latter should be well washed with petrol and slightly roughened with a rasp, and adjusted up a little by the spring. A light tin screen should be placed between the clutch and the gear-box from where the oil usually splashes. Of course, if the leather is badly worn and fired, there is only one remedy, and that is a new clutch leather. The latter gets badly burned by injudicious driving, such as slipping the clutch continually on the high speed on a hill, instead of changing on to the lower speed.

WHEN a car is to be driven through the rain, a great deal of subsequent work and worry can be avoided if all bright parts are given a coat of vaseline. With such a coating there is no immediate necessity for wiping down and polishing such bright parts, as the grease prevents the rain from spotting and tarnishing, while it may be readily removed at any time. Should any plated parts become tarnished they may be restored to their previous brightness by the use of silver polishing powder and a little liquid ammonia.

It should be remembered that exhaust gases contain ingredients of a highly poisonous nature. Therefore, when the engine is run whilst in the stable, always have a door or window wide open so as to ensure free ventilation.

## THE 1906 BRASIER CARS.

[Concluded from page 30.]

PASSING now to the transmission, the clutch is of the leather-faced cone type; that on the 50-60-h.p. car is, however, provided with a special locking system, giving a rigid drive once the clutch is fully engaged. The lock consists of a series of steel plunger rods, held in slides in the male clutch member and constantly pushed in their furthest forward position by means of

Fig. 8.—Sectional View of Differential Shaft in Brasier 25-36-h.p. and 50-60-h.p. Cars.

A. Brake drum. B. Chassis frame. C. Bevel wheel. D. and E. Ball bearings. e and f. Ball bearings. G. Differential gear. P. Chain sprockets. z. Screw caps over bolts holding sprockets in place.

small coil springs. The length of these plungers is such that they clear the web of the flywheel which forms the female member of the clutch when the male part is withdrawn. The plungers are so arranged that the clutch, being put into engagement, will gradually take hold, owing to the leather facing, and so that when the hold is complete the plungers, of which there are four or six, according to the size of the engine, will drop into the nearest ones of the thirty-six holes drilled opposite to them in the flywheel web. A double cardan-shaft transmits the power from the clutch to the primary shaft in the gear-box, and its construction is such that it allows the clutch cone to be easily dismantled. It will be noticed from Fig. 1, page 28 *ante*, that at the forward end of the cardan shaft is a plunging joint, whilst at the rear end is the usual universal joint.

The change-speed gear is of the same type as last year, giving four speeds and reverse controlled by one lever and affording a direct drive on top speed. The shafts, which are stronger than hitherto, rotate on ball bearings. Only one sliding sleeve is used, this being operated by means of a gear-striking bar and fork. The driven intermediate wheel has

Fig. 9.—Sectional View of Half of Rear Live Axle of Brasier 15-24-h.p. Car. The right hand portion of the illustration is a plan, and the left a vertical section.

internally cut teeth, with which the toothed wheel on the end of the sliding sleeve engages for the direct drive. On the outer end of the sleeve carrying this driven intermediate wheel is the driving bevel wheel meshing with the bevel ring C bolted to the differential gear-box (Fig. 8). As previously stated, the transmission on the 15-24-h.p. car is by a cardan shaft; the live

axle is, however, stronger than last year. The small bevel-driving pinion B (Fig. 9) is carried on ball bearings and has ball-thrust bearings. The axle tubes proper are carried at their outer end by two ball bearings fitted inside the wheel hub, so that they carry the load, the internal shafts simply having to transmit the driving effort.

Fig. 10 depicts a somewhat novel departure, which is, however, only fitted to cars intended for use in hilly districts. It is a reducing gear contained in a separate case R, by means of which the number of speeds available are doubled; that is to say, whatever speed may be in mesh in the usual gear-box, a reduction to, roughly, one-half can be obtained by the actuation of a second lever close to the driver's hand. The arrangement is somewhat similar to that introduced in the six-speed Vauxhall car which competed in the Tourist Trophy race last year, and also to that adopted in the Bussing motor-omnibuses. The supplementary reducing gear-box R is interposed between the end of the gear-box proper and the driving bevel pinion, which is not shown in Fig. 10. It will be seen that in the box R are two shafts, on each of which are mounted a sliding and a fixed pinion. The two sliding gears D and I work in unison in such a way that as D is brought into mesh with E the pinion I engages with H, in which position the power is transmitted to J in the proportion of 100 to 56, or 2 to 1.12, while when the pinions D and I are not in engagement with their respective

Fig. 10.—Section through Change-Speed Gear Box and Speed Reduction Case.

gears the drive is direct through the box R. As already mentioned, this reducing gear is only fitted to cars intended for mountainous districts, where long inclines are met with, and where the gradients are such that the fact of eight speeds being at the disposal of the driver in mounting such grades will result in better progress being made.

The usual foot and hand controlled brakes are provided; the brake drums are larger than before, and are now made of stamped steel instead of castings, this reducing the wear and the tendency to seize. It will also be seen from Fig. 1 that the ordinary rear spring horns are replaced by halves of semi-elliptical springs. All three cars are made in two lengths of chassis to enable wide side-entrance bodies to be fitted, the length of carriage work available behind the dash in the case of the larger size being 9 ft. 2 in. Altogether the new Brasier cars comprise many interesting features, and should attract considerable attention at the Agricultural Hall Show next week, where they will make their first public appearance in London.

THE Automobile Club of America has decided to establish a series of competitions to test new devices and improvements, as well as to encourage inventive ability in the direction of automobile improvement. It is proposed to offer prizes for the best inventions introduced within a stated time, and others for open contests to demonstrate the advantages of new carburetors, anti-skidding, and self-starting devices and other practical features.

A DOZEN motor-cabs are about to be put in service in Leipzig, Germany.

THE offer of Messrs. Cordingley and Co. to supply posters announcing the forthcoming motor-car show to managers of garages willing to exhibit the same is still open, and requests are being dealt with at 27-33, Charing Cross Road, London.

MESSRS. DUCROS-MERCEDES, LIMITED, have despatched a two-seated 120-h.p. Mercedes car to the Sultan of Johore.

A MOTOR omnibus is now being constructed by Messrs. Horn, Littlewood and Co., of Gainsborough, for the White Hart Hotel of that town.

The above illustration depicts a somewhat novel car which has lately been put on the market in America. It is stated to have five speeds forward and one reverse; no gears, differentials, friction clutches, etc. Speed four to thirty miles per hour.

A NEW motor garage is being opened on the main London road at Sevenoaks by Messrs. Wm. Hely and Co., who are also prepared to undertake repair work.

ARRANGEMENTS have been made by which members of the Motor Union will be entitled to the use of the Wolseley Motor Car Company's garage at York Street, Westminster, on reduced terms.

MESSRS. COOPER AND Co., of Glasgow, have ordered a two-ton Albion motor lorry. They have had a similar vehicle in use since November doing a daily run of fifty miles without costing anything for repairs.

THERE is a very large increase at Coventry in the number of private car owners this season, and not only are many representatives of motor and cycle firms in Coventry doing their travelling by means of a car, but those in other branches of trade, such as engineers, builders, grocers, tobacconists, architects, etc.

THE motoring public are availing themselves of the free instruction in tyre repairing offered by Messrs. Harvey Frost and Co., Limited, at 39, Great Eastern Street, E.C., and also at their West End showrooms, 215, Shaftesbury Avenue, W.C. These departments are always open to users of H. F. vulcanisers, in order that they may learn the latest information concerning the vulcanising process, and operate their own appliances.

RUDGE-WHITWORTH, LIMITED, are having a unique factory built at Coventry, the main structure of which is of steel frame work. The dimensions are 400 ft. long by 60 ft. wide, with a height of 85 ft. There are six floors, giving an area of three and a half acres. By permission of the architects—Messrs. Harrison and Hattrell—we were permitted to closely inspect this structure, which is now nearing completion, and were informed that the advantages of this style of building were rapidity of construction, greater strength, and less liability of settlement, and an increased area of glass for the reception of daylight. In addition to the manufacture of cycles, Messrs. Rudge-Whitworth, Limited, construct motor-car wheels.

## HERE AND THERE.

THE MARQUIS OF GRAHAM, on his way to open the Glasgow Motor Show, was driven from the station on a Crossley car to the residence of Sir John Ure Primrose, Bart.

It is expected to make the Phyllis Court Club, which is to be established at Henley, an important centre of up-river motoring.

THE Milano Motors, Limited, 92, Gloucester Road, S.W., are the sole agents for the Milano car.

MESSRS. ERNEST ARNOTT AND HOLLOWAY, LIMITED, is the title of a new company registered with a capital of £5,000, and Messrs. E. Arnott and W. C. Holloway as joint managing directors.

THE Department of Agriculture and Technical Instruction in Ireland has approved of the purchase of a motor-car in connection with the automobile instruction classes under the Pembroke Education Committee (Dublin).

MESSRS. J. SIMPSON AND I. B. BLAIBERG are the first directors of the Automobile Transit, Limited, which is "to carry on the business of financiers, promoters, stock and share holders and dealers, motor-car and carriage proprietors."

DURING January 285 motor-cars and 130 motor-cycles were registered in London, thus bringing the total number of cars and cycles registered up to 9,049 and 5,138 respectively; 2,319 licences to drive motor-cars and cycles were issued and changes of ownership of 209 cars and cycles were registered.

ONE of the witnesses of the Scottish Chamber of Agriculture before the Royal Commission on Motor Cars has been confiding to his fellow-members that they advocated the reduction of the speed limit to sixteen miles an hour in daylight. But, he added, they had little hope of securing such a restriction.

WE illustrate herewith a "National" station bus, designed to use solid tyres, and to carry six people inside with 10 cwt. of luggage on the top. The sides of the covered portion of the body can all be removed for use during fine weather, leaving the canopy supported for the purpose of carrying luggage. The inside seats are also so arranged that by tipping them up the whole of the internal capacity of the car can be utilised for luggage should the

vehicle not be required to convey passengers at the same time. The engine is of the standard 18-22-h.p. three-cylinder type. Messrs. Lamb Bros. and Garnett inform us that during its test run from Birmingham to London, fully loaded, an average of twenty miles per hour was attained, with a consumption of just over fifteen miles to the gallon, notwithstanding that the run was made during the night and in very stormy weather.

MOTOR-CABS are about to be introduced in Bristol by Messrs. E. K. Folwell and Co.

WE illustrate herewith a simple little tool which has recently been introduced by M. J. Pupille, of Paris, for removing sparking plugs from cylinders while the motor is in operation, or when it has just ceased running. Usually when a plug is removed from the engine, when it is practically unscrewed, the

motorist grasps it with the fingers in order to prevent it from dropping to the ground and breaking. In the majority of instances he finds it too hot to hold and quickly lets go, with the consequence that it is frequently broken. It is to obviate this trouble that the Evrard pinch

spanner, as the tool is known, has been designed. On top of the device is secured a heavy wire spring, which grasps the hexagon portion of the plug and holds the same firmly after it has been completely unscrewed, so that it cannot be dropped and damaged. The two ends of the spring can be opened, to allow the spanner to be fixed in a position by a small knob A, working in a slide.

THE Pilot Motor-Bus Company, Limited, has been registered as a limited liability company.

MESSRS. WAYTE BROTHERS are allowing their garage in Lemon Street, Dublin, to be open night and day throughout the year.

THE Acre Rubber Company, of 58, High Street, Shaftesbury Avenue, W.C., have opened a branch at 130, Steelhouse Lane, Birmingham.

MESSRS. E. C. WILLIS AND CO. have opened a garage in the Union Road, Leytonstone, where they have also facilities for the repair of cars.

THE South Wales Motor Company are opening motor-car showrooms at 94, St. Mary's Street, Cardiff. Their garage and repair shop will be continued in Park Street.

To work Mr. P. G. Tachi's patents the Newmobile, Limited, has been registered with offices at 78, Hamilton House, Bishopsgate Street Without, E.C., and a capital of £1,000.

MESSRS. HERBERT TERRY AND SONS, of Redditch, have brought out a clip which will be of service to agents for motor-cars and motor-cycles in the display of tickets, etc.

MR. ARTHUR BEALES, of Spalding, has been making a display of motor-cars and cycles in the local drill hall to mark the opening of the season in that part of Lincolnshire.

OWING to a tyre coming off a wheel of the motor mail van running between Birmingham and Worcester the vehicle overturned, resulting in a five hours' delay in the delivery of letters.

A USEFUL tool to facilitate the connecting up of motor-car driving chains has recently been introduced by the J. C. Brown Chain Tool Manufacturing Company, of Butler, Ind., U.S.A. As will be seen, it consists of a straight blade or handle, having a

curved end to grip one link of the chain, and a swinging arm, also provided with a hooked end, which grips the other end of the chain to be connected up. The swinging arm is notched on its upper edge, and a pawl which is pivoted just above the swinging arm engages in the notches. Thus the links

can be drawn together as close as desired, the tool then holding the ends in that relation while the connecting link or bolt is inserted.

MR. JOSEPH WILSON has opened a motor garage and repair shop in connection with his coachbuilding establishment at Middleham, Yorks. He also stocks petrols, oils, spare parts, etc.

THE next A.C.G.B.I. examination for driving and mechanical proficiency certificates will take place in London on the 21st inst.

WE have received a price list of the "Guaranteed" motor tyres of the New Motor and General Rubber Company, Limited, whose non-skids have features worthy the consideration of motorists.

APROPOS of the discussion on throttle valve *v.* variable lift which has recently taken place in our columns, the following description of a throttle patented by Messrs. Soames and Langdon-Davies, which has the simplicity of the former with the advantages of the latter, may be of interest. The system consists of placing in the admission pipe, between the engine and the carburettor, a spring-controlled throttle valve, the tension of the controlling spring of which can be varied as mentioned in our "Current Topics" column of February 10th last. The difference, however, in this arrangement is that one valve serves any number of cylinders, either with M.O. or automatic inlet valves. When not in use for throttling the valve stands wide open, and, not being subjected to any heat, it does not require any attention. It is claimed to be the equivalent of the best form of variable lift, for the reason that it does not open until sufficient suction is attained to overcome the tension of the spring, and therefore the rush of air through the carburettor tends to remain constant in velocity for different speeds of the engine, but to last for a longer or shorter time per stroke; this

has a tendency to automatically keep the mixture constant. In the accompanying drawing A is the inlet from the carburettor, which can be cast in one piece with it; B is the outlet to the cylinders; the valve C is loose on the rod D; if the latter is pulled fully to the left, the position shown in the figure, the valve is sucked open by the engine and remains in that position. When it is desired to throttle, the rod D is pushed to the right and a greater or less pressure is put on the valve C. If the rod is pushed to its fullest extent to the right the tension of the spring is sufficient to prevent the valve C from opening, and the piston valve F, which is fixed on the rod D, is opened, thus allowing the engine to draw in air through G and act as a brake.

AT the meeting of the Bermondsey Borough Council on Tuesday, the Works Committee reported that on the 15th ult. an explosion took place in a gully in Tooley Street. Upon inquiries it was found that it had been the practice of the chauffeurs who drive motor-cars to Chamberlain's Wharf to empty the petrol from their cars previous to going into the wharf premises, as petrol is not allowed there or on the vessels. This petrol is emptied on to the yard of the wharf, and then flows down the channel of Bridge Yard and thence into the gully referred to. On the occasion in question a carman was standing over the gully, and must have dropped a lighted match on to the grating, the result being that a loud report took place, and a column of flame ascended as high as his head, scorching his hair and slightly injuring his face. The police were at once informed of the circumstances, and also the L.C.C., as the sewer into which the gully empties belongs to the latter authority. A communication has been sent to the proprietors of Chamberlain's Wharf acquainting them of the fact, and warning them that if the offenders are detected proceedings will be taken against them for putting deleterious matter into the Council's sewers.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the office, 27-33, Charing Cross Road, W.C.]

### THE TWO-CYLINDER ENGINE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the published reports of the paper recently given by Col. Crompton before the Automobile and Cycle Engineers' Institute there are several statements which can hardly be allowed to pass without scrutiny. For example, the lecturer is reported as having said that "the two-cylinder engine is now rarely seen, even in small cars." Now anyone conversant with the motor industry knows that this is far from being the case. It can with safety be claimed that there is a greater number of two-cylinder cars on the roads to-day than there is "four"; not only so, but at no time in the past have cars with this type of engine been turned out in greater numbers. Some of our largest manufacturers devote special attention to cars fitted with this type of engine, and at present one of the largest motor factories in Britain is solely devoted to their production, and such is the demand that a

Again, it is suggested by Col. Crompton that with two cylinders the tyres must suffer. That this is not so can most readily be shown by actual results. The writer knows of several instances of two-cylinder 10-12-h.p. cars, seated for five persons and used on ordinary roads, having been run for 5,000 and 6,000 miles on one set of tyres, but cannot recall a single instance of as good results being obtained on a four. Nor is this difficult to account for, because the life of a tyre of a given size is, as near as may be, other things being equal, inversely proportional to the horsepower, and is in practice not found to be affected by the number of cylinders.

Having in the first place endeavoured to set aside the two-cylinder engine, Col. Crompton next directs attention to the "complexity of parts, costliness of manufacture, and increased risk of stoppage on the road" of the four and six cylinders, and deplores that English motor engineers are not striving after improvement in the way of greater simplicity and fewness of parts. The Colonel's desire evidently was to pave the way for an advocacy of the steam car, but it seems to the writer that his arguments are far more telling on behalf of the properly designed and built two-cylinder car. In this you have the great simplicity asked and the minimum number of parts to give trouble or to need adjustment, and at a moderate cost. The upkeep of such a car is very low, and for ordinary running need not exceed £50 a year, while such a car can be bought from £350 to £400, with any style of body desired. For the man of moderate means, who wishes to keep his car for general use and who wishes to have the maximum of pleasure with the minimum of worry and expense, the well-made two-cylinder petrol car

The Targa Florio Circuit. The Winding Mountain Road near Castelbuono. (See page 47.)

ready market is being found for an output of twenty vehicles a week.

The lecturer goes on to claim that four and even six cylinders are necessary in order to obtain elasticity of drive, even turning movement, and durability of rubber tyres. From this the novice would naturally infer that a two-cylinder car was non-flexible, ran with a series of jerks, and was heavy on its tyres, yet this is not so; two-cylinder engines as manufactured by the best engine builders run with remarkable sweetness, and when fitted with a suitable flywheel it would baffle most people to tell, after a fifty miles run, whether a two or a four-cylinder engine was below the bonnet.

An altogether inflated value seems of late to have been put on "an even turning movement," without due regard being paid to what is meant by the term. What we have to deal with is the effort exerted by the driving wheels where they touch the ground, and we have to remember that between the drivers and the crankshaft we have the axles, the differential, the cardan shaft (or the driving chains), the clutch and the flywheel, that each of these is tending to keep the motion of the car steady, either by the energy stored in the moving parts or by the elasticity of the parts under stress; further, that the whole mass of the moving car acts to this same end. The engine is giving off an uneven turning effort, it is true, but note the smallness of the time interval during which the fluctuations take place. At the nominal speed of 1,200 r.p.m. we get each complete revolution taking 1-20th of a second or a complete cycle in 1-10th of a second, a period of time too small to permit of the fluctuation of effort from an up-to-date two-cylinder engine reaching further than the flywheel.

takes a lot of beating. Of course, for the man to whom money is no object, who is out to break the legal limit up hill as well as down dale, the four-cylinder high-powered car is essential, but the number of such persons must always be small compared with the thousands to whom the lower-priced, simple, reliable and efficient two-cylinder appeals.

—Yours truly,

L. J. A.

### WHICH BRAKES SHOULD BE MOSTLY USED ON LIVE AXLE CARS?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to Mr. Wellington's letter in the *M.C.J.*, of the 3rd inst., I must say that I quite agree with him that it is wrong to make a practice of using in the general way a brake acting on the cardan or one of the gear shafts on a car, and, as he states, usually it is putting excessive strain on parts that are designed in the first place for transmitting the drive and not for braking. This I have found not only causes excessive wear on the gears, but also on the bearings. At the same time, whilst agreeing with Mr. Wellington on this point, I certainly think the designers of the cars are just as much to blame in fitting single brakes on the cardan and gear shafts. In this case my remarks apply equally to a number of chain-driven cars, of very high class make in some instances, as in all cases I find that it puts strains on the shafts and gears for which they are never designed, and has a very bad effect on the bearings.

The first arrangement to get over this problem was that originally

fitted to and as is now used on the Daimler car. In this case the foot brakes act on each extremity of the countershaft, in consequence relieving the differential of all braking strains—in fact, only throwing the strain on the driving chains to the rear road wheels. Even this method I do not look upon as absolutely ideal, as, in my own opinion, both the hand brakes and foot brakes should act on the rear road wheels, as they have been arranged on the 40-h.p. Brotherhood. By this means none of the gears or shafts that are provided for transmitting the power have to do anything but what they were designed for, whilst I think it is an accepted practice that the nearer one can brake to the periphery of the road wheel the better it is, and besides this, it has numerous other advantages, as, in the case of a live axle car, should the cardan shaft break the foot brakes are useless; and also in the case of a chain-driven car, if the chain breaks, one is in the same predicament, whilst if both brakes act on the rear road wheels nothing short of the collapsing of the back axle or one of the back wheels will put the brakes out of use, when, under such circumstances, in any case, they would not be of any advantage.—Yours truly,

PERCY RICHARDSON.

The Silent Tear.

### KNOCKING IN THE ENGINE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The engine of my double-cylinder car has developed a knock which I cannot locate, and I venture to invoke the aid of the readers of the *M.C.J.* It sounds just as if the crank shaft bearings were loose, and is not the click or knock that is heard from advancing the ignition too far. The noise comes from both cylinders. I have had the engine to pieces, and found the piston rings and crank shaft bearings in excellent condition. The motor runs with perfect regularity, has full power, and never misses an explosion. The valves have been carefully ground, and new springs put on the stems, of the same strength, as nearly as could be determined. Both cylinders register 65 lbs. pressure each, and hold it. By careful adjustment of the ignition and mixture the engine can be made to run so you can scarcely hear it, and this with full load and with any of the speeds. When, however, the accelerator be opened, or a slight rise in the road is met, the bumping commences alarmingly. Even when the knock occurs the engine works with regularity, and there is no difference in the sound of the escaping discharge. Everything sounds perfectly normal with this extra noise added, and sometimes I am inclined to think it must be outside the engine. The car has three speeds forward, sliding gear transmission, and bevel gear drive, and the noise is not only heard, but the knock felt in the machine. There are no explosions in the silencer, and the engine never overheats.—Yours truly,

DEVONIAN.

### ENGINE STARTING TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will any of your readers kindly tell me how to overcome the following difficulty? I have a small car fitted with 8-h.p. single-cylinder engine, magneto ignition, which I can always start at the second turn of the handle, when commencing a journey or when the engine is cold, but after running some miles and stopping I have to turn sometimes a dozen or more times to start the engine. Why should it be more difficult to start when the engine is warm; would the auxiliary accumulator set for low tension magneto remove the difficulty? I should be glad of the experience of any of your readers who have used the same.—Yours truly,

TARANTA.

[We are inclined to think that our correspondent's trouble is not at all to do with the ignition, as if this were the case he would have the same difficulty when starting cold. The trouble is generally reversed, trouble in starting cold, and not when hot. We should be rather in favour of trying the compression, and if found to be weak when hot, use a somewhat thicker lubricating oil. This appears to be the only possible trouble, as the engine will readily start when the lubricating oil is cold and will cause a good compression, but when it is warm is likely to let the compression pass the piston.]

### THREE-CYLINDER ENGINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We are much interested in the correspondence which has been published in your columns on the merits of three-cylinder engines. As pointed out by Mr. Mawdsley Brooke there is one radical defect which condemns this type, however well made, and that is the excessive vibration caused by the sequence of impulses always turning from one end of the engine to the other. This causes a tilting motion which is corrected in the four-cylinder type, and still more so in the six-cylinder type. To prove this it is only necessary to "race" the engine of a three-cylinder car, and watch the steering wheel and compare the vibration with that set upon a four or six cylinder car. We have built engines with one, two, three, four and six cylinders, and so speak from actual experience. We think your correspondents who write in favour of three-cylinders cannot have had actual experience of four and six cylinder engines. Mr. Brooke says that a well-constructed three-cylinder is better than a badly constructed four-cylinder, but surely for the purpose of a fair comparison, it should be assumed that the types compared are of equally good construction. Of course for a perfect balance it is necessary to use a six-cylinder engine, and we find that the public is appreciating the fact to such an extent that we are making six-cylinder cars only, and venture to prophesy that this type will become practically universal for cars of the highest grade, and that the four-cylinder type will supplant the one, two and three cylinder motors now used on the lighter and cheaper cars in general use. In any case, the three-cylinder engine is bound to become obsolete owing to the impossibility of eliminating the excessive vibration which is inseparable from it.—Yours truly,

The Standard Motor Company, Ltd.

R. W. MAUDSLAY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. King's letter in the *M.C.J.* of the 3rd inst. is most interesting, and I trust that he will shortly be able to let us have further particulars of his motor. I can see that it is possible to have a three-cylinder motor of the two-cycle type that would give a fairly constant torque, almost equivalent to a six-cylinder motor, but I cannot conceive how all the crank shaft connecting rod bearings will be in constant thrust. On the other hand, it is of course generally admitted that there are certain drawbacks to two-cycle motors.—Yours truly,

MAWDSLEY BROOKE.

### THE COST OF CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the figures I gave on the question of the three years' guarantee, Mr. Letts, of Messrs. Jarrott and Letts, writes me that the price of the 40-h.p. Dietrich is £1,000, and not £1,100. My figures were taken from a list in a well-known journal entitled "A Guide to Buyers." On the rectified figures given by Mr. Letts their price per b.h.p. would work out at £19 10s. (or £2 better per horse power, roughly speaking £100 cheaper on the total than I stated in my letter). Or, again, the comparison with Mr. Edge's car would be that Mr. Edge should charge at the same ratio £585, or he is in comparison £665 dearer.—Yours truly,

D. M. WEIGEL.

### THROTTLE VALVE OR VARIABLE LIFT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I noticed with interest your remarks on the above subject, and in my opinion the variable valves have no equal. The fine adjustment and regulation of the speed of the engine is only obtainable to a nicety by the use of the variable valves. On the "National" cars the control on the inlet valves as a means of throttling has been made use of with a result that we can secure great flexibility and smoothness of

running, silence and power when required for climbing hills, etc. We incorporate also a variable petrol jet which has great advantages; both these motions are controlled from the face of the steering wheel. The low petrol consumption by the combined use of this arrangement is remarkable.—Yours truly,

P. LAMB.

### OVER-LUBRICATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you or any reader of the *M.C.J.* can assist me in discovering the trouble with my 6-h.p. De Dion car. It began to smoke very thick, and now it has stopped altogether. The sparking plug and contact seem all right, and the petrol goes through the carburettor.—Yours truly,

T. R.

[The trouble of T. R. is evidently one of over-lubricating, and we would advise a thorough wash out of the engine with paraffin, and a proper charge of lubricating oil. If this is not the cause, it may be that too rich a mixture is being used, which can be remedied by opening the airway of the carburettor.]

### A MINIMUM FINE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It may not be generally known that the Guildford magistrates have practically fixed a minimum fine of £5 for offences against the speed limit of motor-cars. It is also worthy of note that

the present costly way of sending milk. What we require is a good, cheap, reliable car, with solid tyres, to take three or four churns of milk, and equally serviceable to use for pleasure, and no doubt some of the second-hand cars could be cheaply converted to this end, as one would not be particular about the latest fashion so long as it was reliable.—Yours truly,

F. HEATH.

### MISFIRING TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Could you or some of the readers of the *M.C.J.* advise me. I have a 12-h.p. De Dion car, new last year. I have no fault to find with the car anywhere except the ignition, and it has been a lot of trouble. I have run on dry batteries and accumulators, and the platinum points soon burn up and want trimming. What I want to know is this, can you or any of your readers tell me whether, if I have a trembler coil and wipe contact, I shall lose power? I mean, will the trembler coil make the engine run slower than with the plain coil? I have asked the makers, and they say I shall lose power, as the trembler coil will not run the engine as fast as the plain coil. I know of two single-cylinder De Dion cars, one 8-h.p. and another 6-h.p., running on trembler coils, and the owners say they do not notice any difference in the speed since changing to the trembler coil. At present I have had a lot of misfiring and running on one cylinder. I have cleaned the platins and adjusted them, also had a new charged accumulator, but all the same sometimes the engine will run for a few miles both cylinders firing and then one will stop for a little and go on again. Can any user of a

The Targa Florio Circuit. The Village of Caltavuturo. (See page 47).

the general principle governing English law lays down a maximum penalty or punishment, leaving the minimum to the discretion of the Court trying the case; indeed, there are, or rather were, only two exceptions to this rule, namely, the crimes of high treason and wilful murder.

In this latter category, therefore, must now be classed the technical offence of driving an automobile at the rate of twenty and one-tenth miles an hour along a desolate stretch of open country in the district that enjoys the advantage of the services of the Guildford Bench.—Yours truly,

STENSON COOKE.

Secretary Automobile Association.

### MOTOR-CARS AND FARMERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A great deal has been said about motors and agriculture and the disastrous effect upon the same, but, instead of any serious injury, I think the introduction of motors will prove highly beneficial, especially in the conveyance of fruit and also milk; and if the milk business could be more centralized I believe it would pay farmers much better than the exorbitant rates charged on rail. If some enterprising motor companies would take the matter up and put on motors to start from certain centres within a radius of thirty miles of London it might be made a paying concern. I met a brother farmer the other day who was grumbling about the low price of hay, and who attributed it all to those blessed motor-cars; but such an assertion will not bear investigation, as I well remember hay being much cheaper before motors were thought about.

I have an idea that if motor-car manufacturers would give it their consideration a trade might be done in cars for station work in place of

12-h.p. De Dion give me a hint as to what is wrong? I have been told that if I use a trembler coil I shall lose four miles per hour. I should like to learn from some user of a 12-h.p. De Dion who has fitted a trembler coil, if it does make the engine slow. Also, please say what make of trembler coil would suit a De Dion car.—Yours truly,

E. W. S.

[The trouble mentioned by our correspondent is no doubt due to a faulty coil. When the platinum points burn quickly, it is usually due to the condensers in the coil having broken down. We consider that E. W. S. would find a great advantage in using a trembler coil, as they are equally as fast as a non-trembler. Any type of high-speed trembler coil would be suitable, especially one used for synchronised ignition, as, if it is fast enough for this work, it would certainly give the desired effect to E. W. S.]

### TIMING A DE DION ENGINE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you kindly oblige me by letting me know how to get the timing right on my 6-h.p. De Dion engine? I have lately taken the engine down to clean it, and I took off the brass plate in front and exposed the two small cog wheels with the attachment to lift up the exhaust valve. Since I replaced them the engine will not start at all, but back fires. I am in a fix, and a reply by post, if possible, will greatly oblige.—Yours truly,

PRESTON BALL.

[To time a De Dion engine it is necessary to determine the position of the piston in the cylinder; this can be done by putting a piece of stout cord through the compression tap (removing the tap, if necessary.)

The engine should then be rotated in the direction it has to run until the piston is within about three-quarters of an inch from the bottom of a downward explosion stroke. The exhaust valve should then commence to lift, and by rotating the engine the valve should close precisely on the top of the stroke. If it does not do this, the cam must be altered either backward or forward until this is correct, as the closing point is of more importance than the opening.]

### ACCUMULATOR TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been having some trouble lately owing to my accumulator constantly running down. I have taken all the wiring completely down, and can find no flaw in the same. Similarly I have tested the contact maker and other parts, but without locating any cause for the trouble. I recently went for a run, and having gone about forty or fifty miles found the accumulator had run down. The voltmeter at starting had registered  $4\frac{1}{2}$  volts, and the car had run quite well up to the time of stopping, when the accumulator only showed about three volts.

I should also feel obliged if you or any of your readers could inform me how to stop the acid leaking out of accumulators.—Yours truly,

WARWICK.

[Provided that the voltmeter is accurate, and that no fault of an intermittent character exists in the wiring, the most probable cause of the trouble is that the accumulator requires fresh acid and rinsing out

If "A 4359" will drill two  $\frac{1}{8}$  in. holes in the above-mentioned air shutter he will find that it will make a great difference in the pulling of his car, also a saving in petrol, and will prevent the plugs, &c., from fouling up. I have made this alteration to several of these cars with remarkable results. Trusting that this information will be of some use to your readers, although late.—Yours truly,

F. G. MILNE.

### AN ENGINE QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "Constant Reader," whose letter appeared in the *M.C.J.* of the 24th ult., I think his trouble may be a similar one to that I experienced some time ago. Having bought a sparking plug with a solid wire centre, I found in use that my engine kept running for some time after switching the current off, owing to the heat being retained in the centre of the plug. I remedied the same by cutting off the thick wire centre and soldering a thin wire in its place to match the wire on the edge of the plug. I have had no trouble since.—Yours truly,

A. D. JACKSON.

J. A. is recommended to Mr. Worby Beaumont's volumes. We shall be glad to hear our readers' opinion as to the best work on the construction of motor-cars.

THE COST OF CARS.—Messrs. S. F. Edge, Ltd., write, that the price of the standard 40-h.p. six-cylinder Napier is £1,050 and not £1,250. "The 40-h.p. chainless type of Napier for which we ask £1,250 costs

The Tyre Trials. The Competitors at the foot of Dashwood Hill. (See page 41).

[Argent Archer.

with water to clear all loose particles of material in the cell. The capacity of an accumulator rapidly declines when the density of the acid falls below a certain point, and if the acid is old, the voltage may fall as soon as the density has dropped below the amount that charging has brought it up to. "Warwick" should test a little of the acid with a hydrometer; to be correct it should be at 1.200 approximately. If it should be as low as 1.0 the accumulator cannot be properly charged. To prevent the acid leaking out of the accumulators, many devices can be used, but they all depend upon whether the containing cells are ebonite or celluloid. Also, by leaking out, does "Warwick" mean actual leakage of the containing cells, or splashing out of the vents? The first can only be remedied by efficiently repairing the cells, the second can be effected by various forms of valve vents and by care in properly fixing the accumulator in the car. The acid can also be made unspillable by making it into a jelly with silicate of soda, but this reduces the capacity in time.]

### A CARBURETTOR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On looking through an old file of the *M.C.J.*, I notice in the issue of October 28th, 1905, a letter from "A 4359," complaining of trouble with the carburettor of a 9-11-h.p. Clement car. He does not state the type of carburettor, but if it is the type with a shutter which covers one of the air ports when the engine is throttled down I may be of assistance to him with the following information; at any rate it may be of interest to other of your readers.

us a higher price because we make the chainless type in small number compared to the chain driven. The b.h.p. of the 40-h.p. is guaranteed at 48."

LOST HUB CAP.—Mr. W. A. Bruce, of the Chater Lea Manufacturing Company, Ltd., writes that on Friday last week he had the misfortune to lose a hub cap from his Brush car (it has the word "Brush" engraved on it), somewhere on the main London and Bishop Stortford road, via Edmonton and Walthamstow.

A LOST BACK LAMP.—Last week a motorist, having tyre trouble, called at the Richmond Motor Body Works, 5, Eton Street, Richmond, S.W. He left his back lamp, which can be obtained on application by the owner.

TAIL LAMP FOUND.—Messrs. Salsbury and Son, Limited, have been advised that one of their tail lamps was found on February 11th, between Windsor and Staines, close by the "Bells of Ouseley," and if any of our readers lost one about that time and place they will be pleased to place him in communication with the finder.

A SCOTCH correspondent asks for information as to the duties of chauffeurs. Perhaps some of our readers can supply this from their own experience.

CLEANING OUT SILENCERS.—"Chiswick" writes:—"Can any reader suggest a way to clean out a silencer without removing it? I have one that is hard to get off and take to pieces."

SOLARINE.—We thank the many correspondents who have sent the address of the Solarine Company, Barnard Street, Southampton, asked for by an enquirer in our last issue.

## CLUBS AND ASSOCIATIONS.

### A.C.G.B.I.

THE annual general meeting of the Automobile Club of Great Britain and Ireland was held on Thursday, last week, at 119, Piccadilly, W. A satisfactory report and balance-sheet for the past year were presented to the members. In the course of his remarks on the report the Hon. A. Stanley referred to the membership of the club, which now numbers over 2,800 members, and to the large amount of useful work achieved in many directions during the year, more particularly as regards the institution of examinations for driving and mechanical proficiency certificates, the collection of evidence for the Royal Commission on Motor Car Traffic, touring at home and abroad, and the institution of the International Tourist Trophy Race for the evolution of the best type of motor-vehicle. He congratulated the club on its work in connection with the prevention of inconsiderate driving, complaints in regard to which had greatly diminished.

The committee for the ensuing year is constituted as follows:—Members elected by ballot:—Hon. Arthur Stanley, M.P., Lord Montagu of Beaulieu, Mr. Lionel de Rothschild, Mr. Charles Hardy, Major F. Lindsay Lloyd, R.E., Mr. Wilson Noble, Mr. E. H. Cozens-Hardy, Lt.-Col. R. E. B. Crompton, C.B., Mr. Stanley Spooner, Mr. Alfred F. Bird, Mr. E. Manville, Mr. J. R. Nisbet, Dr. H. S. Hele-Shaw, F.R.S., Mr. M. O'Gorman, Dr. Bruce Porter, Capt. Dyke Acland, Mr. T. G. Chambers, Mr. T. H. D. Berridge, M.P., Mr. J. D. Siddeley, Mr. James F. Ochs, Mr. Claude Watney, Mr. E. M. C. Instone, Mr. Alfred Armitage, Mr. Henry Sturmer, Dr. J. Hopkins Walters. Non-Retiring Members: Mr. F. P. Armstrong, Mr. W. Worby Beaumont, Hon. Stuart Bouverie, Professor C. V. Boys, F.R.S., Sir W. J. Bull, M.P., Mr. F. H. Butler, Capt. H. H. P. Deasy, Mr. Henry Edmunds, Mr. J. M. Gorham, Col. H. C. L. Holden, R.A., F.R.S., Mr. J. A. Holder, Mr. Vere Ker-Seymer, Mr. W. J. Leonard, Mr. G. Montagu, Mr. Henry Norman, M.P., Mr. Robert E. Phillips, Sir Boverton Redwood, D.Sc., Hon. C. S. Rolls, Mr. C. D. Rose, M.P., Earl Russell, Mr. J. Lyons Sampson, Capt. G. H. J. Skeffington-Smyth, D.S.O., Mr. Sidney Straker, Mr. F. Strickland and Mr. Robert Todd.

### HERTFORDSHIRE.

ON Thursday of last week, at the invitation of the Hertfordshire County Automobile Club, a reception was held at the Masonic Hall, Watford. Mr. C. McWhirter, who acted as chairman, said he should like to see the interest in the club more widespread, and more motorists become members. One of the aims of the club was to make it thoroughly representative of every part of the county of Hertfordshire. There were many advantages in belonging to the club, and he hoped they would not delay in obtaining proposal forms from the secretary if they were not already members.

Mr. Basil Crump then gave an interesting account of motoring in England, Holland, Germany, Switzerland, Ireland, and India. At the close he was accorded a hearty vote of thanks, on the motion of Mr. C. McWhirter, seconded by Mr. W. T. Coles. The Hertfordshire Club have arranged an exhaustive list of fixtures, the principal ones being an open motor-cycle hill climb at Maple Hill on April 21st and an open car hill climb at Aston Hill on June 30th. The opening run takes place on April 7th at Hatfield. Tea will be partaken of at the Red Lion at 4.30. During the reception Mrs. Munro, on behalf of the members of the West Herts Motor Club, now merged in the Herts County A.C., presented to Mr. T. Williams, the hon. secretary, a silver cigarette case, suitably inscribed, as a mark of their appreciation of his services for the past season.

### MANCHESTER.

THE sixth annual dinner of the Manchester Automobile Club was held on Saturday, at the Midland Hotel, the president, Mr. J. A. Morris, in the chair. After the loyal toasts had been honoured, the hon. secretary, Mr. H. Hoyle Smith, read letters of apology from the Lord Mayor of Manchester and others. The president proposed the toast "The Local Governing Authorities," and said they had to thank the chief constables of Manchester and Salford for the consideration shown to them.

Alderman Rudman, responding to the toast, told how last summer he attended a police court as a witness for a friend, whom he believed had not exceeded the speed limit. The chief constable of that place told him he did not desire to bring these gentlemen before the justices, but since the St. Albans scare a number of the members of the local Council, living on a certain road where cars had passed at a speed they believed to be dangerous, had instructed him to insist on his officers acting as checkers or spies. He could assure them that no such instructions would ever be issued by the Chief Constables of Manchester or Salford.

Mr. C. A. Cripps, K.C., who had charge of the toast "Automobilism,"

said there was no doubt that the motoring movement, whether for purposes of pleasure or business, would grow enormously. In town districts particularly they would see the disappearance of the horse and the installation of the motor. There was a Royal Commission sitting, which had had ample evidence. It had had the advantage of the examination and cross-examination of their ex-president. On the question of the speed limit, no one knew what the Royal Commission was going to suggest, but, he could not help feeling that, so long as they had sufficient restrictions where a motor was driven to the common danger, the public had sufficient security that they would be protected against unfair driving. Then there was the question, he would not say of unjust action, for he was a country J.P. himself, but of biased action on the part of the country magistrates, and here in all serious cases there ought to be a possibility of an appeal to the best tribunal they could get, on the cheapest terms the law could provide. Then also, as regarded local authorities, there ought to be a similarity of regulations not dependent on the individual wills of local authorities, but of a general character, applicable under all conditions. Motorists then would know what the law was and would have a guarantee through some central authority that the regulations were just and right.

Mr. Hepper, replying to the toast, congratulated the Manchester Club on its strength and importance. He hoped that the Royal Commission would see that many of the petty little nuisances motorists had been subjected to would be done away with, and, among others, the endorsement of licences for purely technical offences.

Mr. Fred Smith proposed "The Visitors." Mr. Rees Jeffreys, who responded on behalf of the Motor Union, thanked the members of the Manchester Automobile Club for the steady and consistent support they had always given. Referring to the Royal Commission, he said that the motoring movement depended so much on the support it received from the provinces that when the Motor Union's case was being prepared he was extremely anxious that witnesses should be heard from the provincial clubs. It was a remarkably happy thing for automobilism that the election came when it did, for it had had its influence on members of Parliament, as well as on those who elected them. Every member of the House of Commons owed some of his votes to the motor-car, and every member of that House had had the law broken on his behalf. If they were logical, which they were not, every member of Parliament would see that the twenty mile speed limit was abolished.

### YORKSHIRE.

ON the 28th prox. the club will hold a run to Harrogate; on May 12th a joint meet will be held with the Cleveland branch at Borough-bridge, and on June 30th the annual speed trials will take place, at a place to be decided upon later. The following gentlemen have just been elected to membership:—Messrs. James Hill, Allerton, Bradford; C. A. Cooper, Netherwood, Frizinghall; F. Whitworth Wright, Kirby Leas, Halifax; and Mark Day, Oxford Road, Dewsbury.

It is the intention of the committee to arrange, in addition to Leeds and Huddersfield, free casual garage for the members (upon production of their membership cards) in other Yorkshire towns, and the hon. sec., Mr. C. P. Wilson, c.o. Great Northern Hotel, will be glad to hear from any garage owners in Yorkshire who would extend this privilege to members.

### MOTOR CYCLING.

THE opening run of the Motor Cycling Club will be to Brighton on Saturday, March 31st. The meet will take place at Sutton at 3.30, and the route followed will be via Reigate and Crawley, where tea will be taken at Terry's. The stopping place at Brighton will be the Old Ship Hotel, where special terms have been arranged and everyone will be made thoroughly comfortable, while the ample garage will be a great convenience in view of the large crowd anticipated. The destination for lunch on Sunday will be Reigate. Members and friends intending to take part in the run are requested to send in their names to the Captain, Mr. J. A. Jackson, 34, Gt. Ormond Street, W.C.

THE Manx Automobile Club has just completed the first year of its existence.

MR. H. JONES, the hon. sec. of the Sports Committee of the Southern Motor Club, will be pleased to send entry forms to intending entrants for the open hill climb for tri-cars and motor-cycles of his club on the 7th prox., at Coast Hill, Westcott, near Dorking. Particulars of the gradient, etc., will also be sent.

COL. MARK LOCKWOOD, M.P., has been elected vice-president of the Essex Motor Club.

### ROAD REPORTS.

POLICE TRAPS.—With the opening of the touring season, police traps may be expected in certain districts. Readers are invited to keep us informed of any discoveries they may make of the existence of such devices.

MOTORISTS should be careful in the Guildford area, where several traps have lately been in existence.

PERTSHIRE.—Mr. Bell, the surveyor to the Perthshire County Council, agrees that motor-car traffic, which is increasing in his area, does not seriously affect the condition of the surface of the road.

## SOME UNSOLVED PROBLEMS IN MOTOR ENGINEERING.

THE [adjourned meeting of the Automobile and Cycle Engineers' Institute, to discuss the paper recently contributed by Lieut.-Col. Crompton on the above subject, was held at the United Service Institution, Whitehall, on Wednesday week last. Mr. Douglas Leechman occupied the chair and there was a large attendance.

Mr. Henry Sturmeay agreed with the author that anything in mechanical engineering which differed from accepted or orthodox practice was not necessarily a freak. The present designs in motor-car construction were far from satisfactory, and radical modifications must be introduced, especially in regard to commercial vehicles, which were the *reductio ad absurdum* of the pleasure vehicles and served to illustrate in a more complete way the weak points of motor-car construction. Referring to Col. Crompton's statement that the present four-cycle engine was as perfect as it could be made under existing circumstances, he asked for the experiences of any gentleman with two-cycle engines. It seemed to him that though some slight loss of fuel efficiency might result, there would be a simplification of the engine to produce the same turning moment. Personally he thought there was a very great future for engines of that kind, without shaft drive, reversing gear, or the ordinary Panhard type of gear. A car such as the Lucas would be at least as simple as any steam car ever produced. After all, the question of plant efficiency was ruled by simplicity of construction. He did not think the author of the paper had been quite fair to the petrol car in his comparison of a £900 petrol car with a £600 steamer, as there were plenty of petrol cars about

facture of one of these and observing some of its tests, and the claims made for this motor were far in advance of anything that could be obtained from the ordinary four-cycle explosion engine. He did not think that the clutch was at all perfect yet, otherwise they would not have so many different designs. It was rather astonishing that more had not been done in the way of fuel tests, and of the tests which had been made by Messrs. Hutton with naphthalene nothing had yet been heard. Experiments had also been made with alcohol, but here it was necessary to specially design the engine from beginning to end. With regard to the comparative cost of steam and petrol cars, there were difficulties with steam which condemned it. Still the steam car was a good vehicle, and for many purposes was far superior to the petrol machine.

Mr. Clarkson spoke of the steam car. He remarked that there was no difficulty about burning heavy oils at all rates of combustion from minimum to maximum. One of the original difficulties in connection with the burner was in starting it. They had, however, devised a starter to use paraffin, and now the starting arrangement had been brought to a high degree of perfection—so much so that they could start up a large 32-h.p. engine from all cold. In the old form of boiler the water gauge needed constant attention, but now it was automatic in the fullest sense of the word, both as to water supply and fuel. One of the greatest improvements and discoveries recently made was the governing of the fuel supply by the dual system of temperature and pressure. The pressure governor took care of the fuel when the car was standing, and the thermo governor when the car was running. It was a duplex form of governor, each acting independently of the other.

Mr. Coventry said that since 1903 he had had charge of cars running in public service for 800,000 miles, and he had analysed the causes of failure as follows:—About 45 per cent. were due to petrol supply and

The Peugeot 8-h.p. Single Cylinder Car with detachable Tonneau to be exhibited at the Agricultural Hall by Messrs. Friswell, Ltd.

the same price as the steamer which would give approximately the same results. Many petrol cars would also compare favourably with the steamer in regard to repairs. The question of the number of cylinders was largely one of fashion. In regard to the statement that there was no such thing as direct drive Mr. Sturmeay thought Col. Crompton had overlooked the fact that there were cars which drove by chains from the engine shaft to the rear axle—a two-shaft drive, as with steam cars. He joined in condemning the cardan shaft drive, remarking that he could not see how anyone with any engineering instincts could use a double gear to transmit power if he could do it by any other means. He would like to know whether any comparative tests had been made between worm and bevel gearing. He agreed with Col. Crompton's view that if they had cylinders large enough to start a 'bus with the ordinary clutch and drove practically direct they would probably get much nearer the mark; he would abolish the gear shaft altogether and drive direct by chains. They would then get over the trouble of having the gear shaft down the centre of the 'bus, and with the chains encased they would have a drive which would be exceedingly sweet and simple, which would absorb very little power and would last. The one thing which had caused chain drive to fall into disrepute was the fact that the chains in the cars of to-day were placed in absolutely the worst position possible for ensuring anything like length of life. If a chain was properly protected he was satisfied that it would beat any other form of transmission.

Mr. J. W. Roebuck questioned Col. Crompton's dictum that the petrol engine was perfect. Indeed, he thought they should not be satisfied until it was as perfect as the electric motor, with the same uniform torque and without any tendency to tip over the car. He instanced the Lanchester engine as one having its reciprocating parts well balanced and one which had not received the attention it deserved. With regard to two-stroke motors, he recently had the opportunity of seeing the manu-

carburation; 25 per cent. to ignition; 23 per cent. to gear and clutch; 6 per cent. to engine; 1 per cent. to the differential. This left out tyre failures, spring troubles and other odds and ends. The 45 per cent. of petrol failures were very easily remedied, being due chiefly to water in petrol; to badly-designed filter or no filter at all between the petrol tank and the carburettor; to poorly designed pipes, long lengths unsupported, and no arrangement made for expansion or vibration, etc. This seemed to be a very simple engineering problem, which could easily be put right. Of ignition failures the greater number had been owing to badly-designed plugs, or to the magneto itself. He had had no magnetos remagnetised, though they had been taken apart to be cleaned in the ordinary way. That was about as efficient as any engineering machine could be expected to be. With low tension magneto driven direct off the half-speed shaft, brought well back out of the way of any oil or dirt from the engine, and boxed in under the footboard in a position where it could be got at, with solid brass wire leads enclosed in large insulating tubes, leading up to a well designed cut-out arrangement for the plug, worked with a trip motion, so that any getting out of timing due to wear inside the cylinder would be got rid of, and the problem of ignition would be solved. A great many of the failures were comparatively small—five or ten minutes on long runs. A number of failures had been due to gear wheels shearing off the flanges. He would like to see flanges made solid with the shaft and the gear wheels bolted between the solid flange, and a loose flange in two halves placed between the fixed flanges. He would also like to see a system of lubrication entirely out of the hands of the driver. Differential failures had been practically nil—only one per cent. during the whole time. They had worn out about three bevel wheels in three thousand miles, many of the vehicles having been on the road three years.

(To be concluded).

## THE GLASGOW MOTOR CAR SHOW.

FOLLOWING Edinburgh's example, Glasgow is this year being favoured with a motor-car show, which was opened in the Exhibition Hall, Duke Street, on Friday last week. The exhibition is the largest which has so far been held in the great Scottish shipbuilding centre. One of the first stands to strike the eye is that of Argyll Motors, Limited; it is designed to represent the front of their new and extensive works at Alexandria, N.B. A full range of the well-known Argyll cars is on view, including the 10-12-h.p. double-cylinder, and 14-16-h.p. and 16-20-h.p. four-cylinder models. One of the smaller vehicles is fitted with a sample-carrying body specially designed for commercial travellers' use.

The Rossleigh Motor Company, Ltd., Glasgow, have a large stand, on which are shown examples of the 28-36-h.p. and 30-40-h.p. Daimlers, a 12-h.p. and 16-h.p. Peugeot, the latter being fitted with a handsome six-seated limousine body, a 10-h.p. Darracq and a 10-12-h.p. Humber. Another extensive stand is that of the Western Motor Company, Ltd., Glasgow, who are exhibiting three sizes of Delaunay-Belleville cars, 16-20-h.p., 20-28-h.p., and 28-36-h.p., all fitted with highly finished bodies built by the Burlington Carriage Company, Ltd., and a range of the well-known Argyll cars, including the 10-12-h.p., 14-16-h.p., and 16-20-h.p. models, including one with a luxurious double landaulet body. Messrs. V. Jennings and Co., Glasgow, show a Humber 10-12-h.p. car, and 5-h.p. tri-car, as well as a Quadrant Carrette. The Northern Engineering and Manufacturing Company, Glasgow, exhibit one of the Talbot cars and examples of the Spyker dustless 14-18-h.p. and 20-28-h.p. vehicles. An interesting display of the Darracq cars is made by the Kennedy Motor Company, Ltd., Cathcart, ranging from the new 8-h.p. four-seated car to a handsome 20-32-h.p. double phaeton. Specimens of the 6-h.p., 8-h.p., and 12-h.p. Wolseley cars, together with a full range of Siddleley vehicles, 6-h.p., 12-h.p., 15-h.p., 18-h.p., and 32-h.p., are shown by the Wolseley Tool and Motor Car Company, Limited. Messrs. John Croall and Son, Limited, exhibit the 60-75-h.p. De Dietrich chassis, of which a description was given in a recent issue of the *M.C.J.*; a 16-24-h.p. De Dietrich and a 20-25-h.p. Mercedes are also on view. The Albion Motor Car Company, Limited, of Scotstoun, are present with examples of their 16-h.p. and 24-h.p. cars, the former being fitted with a double landaulet body by Penman, of Dumfries. Examples of the West 10-12-h.p. two-cylinder and 12-16-h.p. and 15-h.p. four-cylinder chassis are shown by Mr. R. Wight, junr., Edinburgh. These are all fitted with Aster engines and cardan-shaft transmission. Mr. Wm. McLean, of Glasgow, the maker of the St. Vincent cars, shows a 24-30-h.p. vehicle fitted with Aster engine, a 12-h.p. van, and an 18-22-h.p. double landaulet. The Bergius Car and Engine Company, Glasgow, stage a Kelvin 16-h.p. four-cylinder car with side-entrance body, as well as examples of their 7-9-h.p. and 14-16-h.p. launch engines. A new firm is the Neilson Motor Company, Limited, Glasgow, who, in addition to examples of the Germain, Martini, Daimler, and Mors cars, are exhibiting a chassis of the new 40-h.p. Crossley car, which is attracting considerable attention. Another new exhibitor is Mr. John Ridley, Paisley, who exhibits a 6-h.p. two-seated car and a light van of equal power. There are several special features in the vehicles, notably as regards the gear, which we hope to refer to more fully in a later issue. Other exhibitors of cars include the Peacock Autocar Company, Glasgow (Chenard-Walcker), Mr. C. M. Farrow, Glasgow (Rexette), Messrs. L. C. Seligmann and Company, Glasgow (Clement), Messrs. Rennie and Prosser, Limited, Glasgow (Mercedes, Siddleley, Panhard, and Napier), the New Arrol-Johnston Car Company, Limited, the Holloway Manufacturing Company, Bridgeton (an 18-22-h.p. Holloway car with Aster engine), Messrs. Bell Bros., Manchester (Bell cars), Messrs. Gibbon and Company, Glasgow (Darracq, Minerva, Rover and Vinot-Deguingand), Messrs. MacLaren Bros., Dumbarton (Scout motors), and the Scottish Motor Syndicate, Glasgow (Winton and De Dion).

In the heavy vehicle section Messrs. Robert Morton and Sons, Limited, of Wishaw, N.B., display a 25-h.p. steam motor-van and a lorry and chassis of similar power. Messrs. D. Stewart and Company, Limited, Glasgow, show two steam wagons, one being of 4-ton capacity, and the other of 5 tons. The Glasgow Motor Lorry Company, Limited, exhibit a 3-ton steam van, specially built for the transport of milk cans, and a 5-ton wagon constructed to the order of the Glasgow Motor Haulage Company, Limited. Other exhibitors in this section include the Yorkshire Patent Steam Wagon Company, Limited, Messrs. J. Robertson and Son, Fleetwood, Messrs. T. Coulthard and Company, Limited, Preston, and the Scottish Motor and Engineering Company, Granton.

In the accessory branch Mr. Rudolph Raitt, of Blairgowrie, displays a collapsible trestle which should be found useful by motor-car repairers, as by its means the work of disassembling and assembling parts of the mechanism of motor-cars and also of changing one type of body for another is greatly facilitated. Among other firms we noticed are the General Petroleum Company, Limited (Shell motor spirit), Messrs. Jas. Thomson, of Edinburgh (accessories), Messrs. Jones Bros., Limited (Selvyt), Messrs. Alfred Dunhill, Limited ("everything but the motor"), Messrs. S. Stevenson and Co., Glasgow (motor-car and lorry wheels, etc.), Messrs. W. Barton and Sons, Edinburgh (coils and accumulators), Price's Patent Candle Company, Limited (coils and greases), the Samson Leather Treads and Tyre Company, Limited, London (non-skids), the North British Rubber Company, Limited (Clincher tyres), Messrs. J. E. Hopkinson and Co., Limited (the Hopkinson solid tyres), the Cave

Quick Change Tyre Rim Syndicate, the Shrewsbury and Challiner Tyre Company, Limited (wheels and tyres for all classes of motor-vehicles), Messrs. R. and J. Pullman, Limited, Godalming (non-skids). The show closes to-day (Saturday).

### PUBLIC MOTOR SERVICES.

MESSRS. RADFORD BROTHERS, of Rostrevor, co. Down, are starting a service of motor-vehicles into operation between Newry, Rostrevor, and Warrenpoint.

THE members of the Yeadon District Council are about to visit other places where motor-'bus services are in operation.

A MOTOR-CAR service is to be established between Christchurch Road and the pier at Boscombe.

THE G.E.R. motor-'buses commenced running for the season on Monday between Loddon and Beccles station. The service between the former place and the Victoria Station at Norwich also recommenced on the same day.

THE Sussex Motor Road Car Company, Ltd., has recommenced an extension to Kemp Town, Brighton.

### MOTOR TEACHERS ACQUITTED.

RISKI MEDAWAR and John Raymond Kerr, the two young men accused of conspiracy to defraud in connection with the Motor Drivers' Union, have been discharged at the Central Criminal Court.

Mr. Marshall Hall, addressing the jury in defence, denied that the accused had been concerned in any conspiracy to defraud. The business of the Motor Drivers' Union had grown, and possibly it had outgrown the means which the Union had of coping with it. The Common Serjeant ruled that there was no case of fraud to go to the jury.

Motor Racing in Cuba. The Cars on the Quay at Havana.

### THE BUSINESS OF RAILWAY COMPANIES.

AN action was instituted by the Attorney-General, at the relation of the Corporation of Birkenhead, who asked for an injunction to restrain the Mersey Railway Company from running motor-omnibuses in connection with their railway system in the borough of Birkenhead, whereby, it was alleged, they were acting *ultra vires, id est*, in excess of their statutory powers, either expressed or implied.

The Corporation of Birkenhead owned the system of electric tramways which passed through the borough, and which had cost them £350,000. The Mersey Railway was a line which ran under the river Mersey, and thus connected the city of Liverpool with Birkenhead. The company had a central station at Birkenhead, and other stations in outlying parts of the borough. The railway company had recently bought several motor-omnibuses, and were running them from their central station to different parts of the suburbs, for the conveyance of passengers to and from their stations, and not only were they conveying passengers, or intending passengers, on their railway, but any member of the public who wanted to go from one point to another on the line of route.

The plaintiffs' contention was that the running of these omnibuses was not incident to and consequential upon the carrying on of a railway business, but was a separate and distinct business altogether, and it was, therefore, beyond the scope of the defendants' Acts to carry it on. On behalf of the defendant company, it was submitted that the running of omnibuses for the conveyance of passengers in connection with the railway service was just as incident to the proper working of the railway as to employ carts and wagons for the collecting and distribution of goods, parcels, merchandise, etc.

His lordship, in giving judgment, said that he must, on the authority

of decided cases and *dicta*, find in favour of the plaintiffs, and grant an injunction against the defendants, in the terms asked. Although a railway company might conveniently carry on an omnibus business in connection with their railway system, such a business could not be said to be incidental to and consequential upon the conducting of a railway system.

The injunction was granted accordingly, but was suspended for fourteen days, with view to an appeal.

### OBSTRUCTION OF THE HIGHWAY.

At Norham and Islandshire Sessions, Berwick-on-Tweed, on Wednesday, March 7th, John Coulter, of Manchester, proprietor of locomotive and wagons, was summoned for obstructing the highway, and also for infringing the County Council byelaw as to keeping a heavy locomotive stationary on a bridge. Mr. John A. Williamson, solicitor, Newcastle-upon-Tyne, prosecuted on behalf of the North Eastern Automobile Association, and Mr. Adam Douglas, solicitor, defended. Captain Burrell, of Carham Hall, stated that he was driving his motor-car on the main road from Cornhill to Berwick on Saturday morning, February 24th, and he met the defendant with a heavy locomotive and three wagons. The defendant stopped the locomotive on the middle of the road on a bridge and took in water. Captain Burrell could not get past with his motor-car and had to wait for twenty minutes until defendant had finished taking water from the burn, the road in the both directions being obstructed for that period of time. The Bench informed the defendant that he had no right to obstruct the highway and keep Captain Burrell waiting there for twenty minutes, and fined him £2 and costs, £1 for obstructing the highway and £1 for infringing the County Council byelaw.

### MOTOR-CAR ACCIDENTS.

A MOTORIST has had an extremely narrow escape of being run over at the Loudwater level-crossing of the Great Western Railway, near High Wycombe. The car, driven by Mr. John Lancaster, on reaching the top of Treadaway Hill—a very steep decline to Loudwater Station—proceeded headlong down the road in consequence of the brake failing to act. Mr. Perrin, a passenger, realising the danger, jumped out, and sustained some injuries and a bad shaking. Mr. Lancaster stuck to the car, which, on reaching the railway gates at the bottom of the declivity, crashed through them and got on to the railway line. A train was approaching, but was stopped just in time.

In attempting to avoid a dog in the Coventry Road, Birmingham, a motor-car swerved in front of two bicycles, causing the two ladies who were riding them to be thrown to the ground. One of the ladies was taken to the General Hospital suffering serious injuries from a compound fracture of the thigh.

### CASES AGAINST MOTORISTS.

At the Newcastle police court, Charles Englebach was summoned on a charge of having, on the 14th inst., driven a motor-car at a speed which was dangerous to the public. P.C. Railston, who was on point duty at the junction of Westgate Road and Grainger Street, stated that on the 14th inst. he saw the defendant driving a motor-car down Grainger Street at a speed of not less than fifteen miles an hour. When about thirty yards off witness held up his hand for defendant to stop, but he took no notice, and drove straight on. Thomas Emerson stated that he was standing on the footpath in Grainger Street West, when he saw the motor-car. It was going 100 yards in ten seconds. It would have been impossible for the fastest runner to keep up with the car. Mr. Holmes, for the defence: I put it to you that your estimate works out at seventeen miles an hour. Can a man run seventeen miles an hour?—Oh, no. If you work it out at 100 yards in ten seconds, you will get it up to twenty. Defendant stated that he was the head of Messrs. Armstrong's motor-car department at Scotswood. The speed would certainly not be more than ten miles an hour—about eight or nine. He saw the policeman in the middle of the road, but he never saw him give any signal. The Bench held that the speed was greater than was necessary, considering the state of the traffic, and imposed a fine of £2 and costs.

At Loughborough Police Court, Albert Farnell, of Manningham Lane, Bradford, was summoned under the Motor-Car Order, 1904, for refusing to stop his car when Wm. Lowe, the driver of a horse and cart, put his hand up as a signal for him to stop. Mr. Read, of Huddersfield, defended. Wm. Lowe, carrier, Rempstone, said that about 12.15 on February 8th he was driving a cart into Loughborough. When near Cotes they met a motor-car, and witness pulled to the side of the road. As his horse seemed timid, and did not like to face the car, witness put up his hand three times for them to stop. They did not pay any regard. His horse was so frightened that it jumped round, and the wheel went up the bank. Then the horse jumped back and broke the harness, throwing witness and the passengers out of the cart. Witness was hurt, and had been under the doctor since, and two of the passengers were also hurt. The occupants of the car came back, and they took witness home in the car. He asked their names, but they said he need not trouble. Mr. Read, in defence, said the reason why the case was brought was bound up in the one word "compensation." Mr.

Read then raised a technical objection, stating that these proceedings were taken under the Motor-Car Use and Construction Order, 1904, and that was a proceeding in Council that ought to have been proved in accordance with the provisions of the Documentary Evidence Act. That had not been done, the prosecution had closed their case, and therefore it failed. They did not commit the offence, for they must have seen the hand if it was put up. The chairman said the magistrates were of the opinion that the occupants of the car did everything they possibly could for the people, and that they might have been mistaken as to the putting up of the hand. They suggested that the case should be withdrawn on payment of costs. The suggestion was accepted by the police and the defendant.

CHRISTOPHER CHARLES FRISBY, the driver of a motor-omnibus, was summoned at the Lambeth Police Court by the police for omitting, when his vehicle was stationary, to stop the action of all machinery so far as was necessary to prevent noise. There was a second summons against the defendant for quitting the bus without taking due precautions against it being started in his absence. Police-sergeant Matthews said he found the defendant's motor-bus standing in Deacon Street, Walworth. The machinery was running. After the lapse of four minutes the defendant came out of a house, and witness said to him, "How is it you leave your motor-omnibus with the machinery running and without anyone to look after it?" The defendant replied, "I can stop it, if you want it stopped." He pointed out to the defendant the danger there was of the motor being started in his absence, and also the noise it was making. The defendant now pleaded that he was ignorant of the regulations. Mr. Hopkins: "Don't you know that if you leave your bus with the machinery running some silly boy will get up and touch the levers." The defendant retorted that a boy would not know how to do it. Mr. Hopkins: "It's the silly boy's business to find out how to start a motor for the purpose of starting one when he gets the chance. It is exceedingly dangerous. There will be a penalty of 20s. and 4s. costs."

EARL RUSSELL, of Telegraph House, Chichester, has been summoned at Kingston for driving a motor-car at a greater speed than twenty miles an hour on the Portsmouth road at Cobham on February 26th. His lordship did not appear, but the chairman intimated that he had written a letter, in which he admitted that he had exceeded the limit. Three previous convictions for a similar offence were proved, and the magistrates imposed a penalty of £15, with 13s. costs.

LIONEL ANDERSON, of Riversdale Road, Highbury, was summoned by the police at the North London Court, for (1) having no lights on his motor-car after dark, and (2) for having no light on the identification plate in the rear. Constable Foster said he saw the defendant's car at a standstill near his residence for quite twenty minutes. There were no lights on it. The Defendant.—I pulled up at a well-lighted spot and turned out the acetylene lights. When I came out of the house I relighted the lamps, and was proceeding on my journey when the constable came to take my name and address. I submit that I have done no wrong, because the car was not proceeding. Mr. d'Eyncourt: I don't think the regulations were framed to meet such a case as this. They all go on the assumption that the car was proceeding. The police should have taken their summons against the defendant for obstruction with his car. As it stands, the car was not being used, and was not proceeding, and we do not know in what direction it was going to proceed. The summons is dismissed.

AN action was heard at the Boston County Court on Monday, before Sir Geo. Sherston, Bart., and a jury. It was brought by John Alliss, farmer, Medville, near Boston, who sued Dr. W. F. Miller, of Wrangle, for £12 15s. damages sustained by plaintiff by reason of the defendant's negligent driving of a motor-car on January 16th last. The case for the plaintiff was that a wagon and three horses was near Old Leake station, when defendant approached in a motor-car at a rapid pace. The horses became restive, but defendant did not stop until the animals swerved across the road in front of him, when the shaft horse was thrown down and the wagon was overturned, the wagon being partly smashed. Dr. Miller stated that he was driving twelve miles an hour. When forty yards away he noticed that the leading horse cocked its ears and became restive, whereupon he immediately stopped the engine and put on the brakes, reducing the speed to five or six miles an hour. The leading horse swerved across the road in front of him, and he then stopped the car altogether, being at the time eighteen yards away from the horses. His Honour said the point the jury had to consider was, whether the defendant, when he saw that the horses were restive, was justified in going on, or whether he ought to have stopped at once. The jury found a verdict for the plaintiff for the full amount, and judgment was given accordingly with costs.

Place.	Summoned for	Result.
Brighton ...	Dangerous speed	40s., etc.
Croydon ...	Exceeding legal limit	£10, etc.
North London ...	Drunk while in charge of a car	10s., etc.
Solihull ...	Keeping motor-cycle without Inland Revenue licence	£1, etc.
Hamilton ...	No rear light	15s., etc.

# THE Motor-Car Journal.

VOL. VIII.]

LONDON, SATURDAY, MARCH 24, 1906.

[No. 368.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

### The Exhibition.

READERS will scarcely need to be reminded of the fact that Cordingley's eleventh Motor-Car Exhibition at the Agricultural Hall, London, opens to-day (Saturday), and will continue throughout next week. From a glance at the catalogue it is evident that the high expectations raised will be fulfilled, and that many distinct novelties and highly-finished specimens of automobile engineering will be on view. Italy will be conspicuous among the exhibitors; the splendid work of British engineers will be again demonstrated, and from what we have heard during recent days good business may be expected.

### Meetings at the Agricultural Hall.

A NOTABLE feature illustrative of the position attained by this display in the automobile world is the list of meetings that will be held during the week. This is as follows:—

Monday—Automobile Association.  
Tuesday—Motor Van and Wagon Users' Association.  
Wednesday—Ladies' Automobile Club;  
Motor Union Annual Meeting.  
Thursday—Cycle and Allied Trades Association;  
Aero Club.  
Friday—Automobile Mutual Protection Association.

This list is a fitting reply to the efforts made by a certain section of the trade—referred to in our Correspondence columns—to lessen the interest felt in the Exhibition.

### The Van Trials.

THE hint conveyed by Colonel Crompton's recent letter on behalf of the Motor Van and Wagon Users' Association to the A.C.G.B.I. has apparently had the effect of causing the Club to advise a little more haste to its Trials Committee in connection with the suggested trials of delivery vans. Disappointment at the previous fiasco is yet keen, and much time has been lost in securing that prosperity for the builders of commercial vehicles that their work entitled them to. The Association naturally points to the importance of such trials in developing the use of the light motor-van, and its offer of assistance to the Club in organising the matter should secure not only the hearty co-operation, but an effective share in the work of organisation.

### The Automobile Association.

MANY readers of the *M.C.J.* will recognise in the new campaign of the Automobile Association a scheme of useful work such as has been freely advocated in the Journal for some years past. Now that some of the southern roads are becoming safer to motorists owing to the Association's scouts having rendered the police trap unprofitable, a further sphere of activity is being wisely entered upon, and a threefold programme has been suggested to the committee as follows:—1, the close trimming of hedges at cross roads; 2, the

display of the names of villages and hamlets at each end thereof; and 3, the restoration and improvement of unsatisfactory direction posts. This is to be taken up in a business-like manner, and not suffered to lapse after a desultory correspondence. The Post Office requires that the name of the hamlet shall be conspicuously displayed over the local postal premises; this is often done in such a way as to be of little value, and the point might also be watched by the Association with a view to the Post Office seeing that its responsibility is not set at naught by local officials. Anyhow, the additional work now undertaken by the Association is of such great utility to those who travel by road, that we anticipate there will be little difficulty in doubling its membership and so extending its influence. In the Gallery at the Exhibition it will have a stand where further information as to its propaganda may be obtained.

### Cars and the Elections.

NEW aspects of the use of the automobile in connection with the recent General Election continue to be presented, and almost every week since that event various people have pointed out different advantages that the car has given to the political world. Mr. Frederick Thoresby, whose experience in connection with motor-car insurance is extensive, has had a special calculation made showing that in the week when the elections were thickest the additional accidents due solely to the contests cost his company over £1,500 beyond their normal experience for accidental damage to car and third party claims. This may seem a large amount, but it is valuable as proving the safety of the car. When it is remembered that these vehicles were careering about in all parts of the country and that their drivers were frequently in unfamiliar localities it is a tribute to the automobile that accidents and mishaps were so few.

### "Lay" and "Technical."

A PRETTY little controversy is going on between some champions of the "lay" and "technical" press, which has the merit of enabling writers with nothing else to write about to fill their columns. Having read much on both sides, we are inclined to agree with Major C. G. Matson, who sees "no reason why there should be the slightest antagonism between the two classes of critics." As a matter of fact both parties have to learn; there is no finality in knowledge. Hence the need for each to adopt a tolerant attitude and not be always ready to denounce the other.

### The Education of Workmen.

THE fact that many of the leading makers of motor-cars give facilities for their workmen to visit such exhibitions as that now in progress at the Agricultural Hall, is significant of the recognition that is now made of the need of well-informed assistants. The old time idea of keeping workpeople in entire ignorance of the productions of other establishments has been dissipated, and enterprising firms now encourage their men to study the details and finished goods of other people.

Last Saturday the motor show at Glasgow was visited by the workpeople from three well-known Scottish builders of vehicles, and during the coming week the London exhibition will have equal interest for foremen and others from British works, while many of the automobile instructors from the polytechnics and technical schools will take the opportunity of acquainting themselves with the latest developments in an industry the progressive advance of which is one of the most notable movements in the engineering world of to-day. As educational forces exhibitions have acknowledged influence with the public; they are even more valuable to those engaged in the actual work of production.

#### Police Traps.

THAT the police trap has not been quite dissipated is evident from the illustration we are able to publish of the scene of such a device on the Portsmouth road. Its exact location is near the twenty-third milestone from London.

This trap was discovered by the Automobile Association scouts, and the photo taken by the chairman of the association, Colonel W. J. Bosworth, when on inspection duty. The policeman hides behind a specially-constructed hedge on the right of the

photo. The simple villager standing in the gateway gives an air of innocence to the ambuscade.

#### The Ladies' Club.

ON Saturday last the Ladies' Automobile Club commenced its outdoor programme for the present season, nearly seventy guests assembling at Montreal, Sevenoaks, the home of the Earl and Countess of Amherst. It was a perfect

day for the run from town, the sun being in gracious mood, while the good roads and absence of dust contributed to the enjoyment of the motorists. Most of the guests arrived at Montreal about four o'clock and were welcomed by Lady Amherst in a room full of quaint curios. After a visit had been paid to the golf course, park, and gardens, tea was partaken of in the ballroom. Several of the members had to leave early, and for this reason only about thirteen cars were available when the usual photograph was taken after tea. Among those who accepted Lady Amherst's invitation were:—Mrs. and Miss Ansdén, Mr. and Mrs. Ash, Mrs. Foyster Bowen, the Hon. Lady Birkbeck, Mrs. Harold Browne, Mrs. William Cleaver, Mrs. Dawson, Mrs. Foster, Mrs. Guy Hardy, Miss Hills, Mrs. Loeffler, Miss Johnston, Mrs. Kinlock, Colonel and Mrs. Morland, Mrs. Manville, Mrs. Merryweather, Miss Pilcher, Captain Pears, Mr. Leslie Sanders, Mrs. Richardson, Mrs. C. Boevey, Miss Watts, Miss Beresford, Mrs. Ward, Lady Nore, and Miss d'Esterre-Hughes, secretary.

#### The Tourist Trophy.

ON another page we give a list of the entrants for the International Tourist Trophy to be held in the Isle of Man in September next. With regard to this Mr. J. W. Orde, the secretary of the A.C.G.B.I., asks us to draw the attention of readers to an erroneous impression which seems to obtain in some quarters, namely, that the sole object of the race is to promote economy in fuel consumption. This idea is quite incorrect, as the primary object of the Club in fixing a definite allowance of fuel for a given distance is simply to limit the horse power, and thereby the speed, of the competing vehicles, thus restricting the race to *bona fide* touring cars. This method of limiting engine power was chosen on account of its simplicity, after the other methods had been carefully considered by the committee responsible. The allowance of petroleum spirit for this year's race has been fixed at one gallon for every twenty-five miles of the course. Further entries will be announced in our columns from time to time.

#### Public Vehicles in London.

ALTHOUGH there will be no fresh legislation for automobiles this year, and the chances of any adequate Traffic Act with regard to London are equally remote, there is likely to be a small mercy extended towards mechanical traction in the public service, for which we should be grateful. A Select Committee is to be appointed to inquire into some of the anomalies affecting cabs and buses in the metropolis, and one of the matters to be included in the purview is the structural requirements to be enforced so far as cabs and omnibuses driven by mechanical power are concerned. This is important; it can be made the occasion for advocating the covered top that the Commissioner at present declines to sanction, and from the composition of the Committee there is hope. On this body it is proposed to appoint Mr. H. Norman, who is well acquainted with the practical aspect of the matter; Sir Samuel Scott and Mr. Armitage, both motorists, and Alderman Bowerman, a member of the Southern Motor Club. Their real knowledge of motoring affairs should make their views extremely useful to their fellow members who have not had the advantage of an automobile education.

#### Garages in Royal Mews.

GREAT are the changes now in progress in the Royal mews consequent on the general favour shown by the King to the motor-car. During the next twelve-month large sums will be expended by the First Commissioner of Works on this account, the principle having been laid down that there shall be a motor garage in each of the mews attached to a Royal Palace. Although the automobile has not yet attained to the dignity of participating in State ceremonials, it has become recognised in connection with affairs of great social distinction, and its place in the best Society is fully assured.

#### On the Great North Road.

WITHIN easy access of London, and on the main line of railway to the north, the district around Letchworth promises to develop as an important centre for the new industries that modern means of locomotion are bringing into existence. Already the supply of labour is growing, following the erection of houses on the Garden City estate at Letchworth, near Hitchin, and the commercial enterprise with which that development is being conducted will be a great factor in attracting manufacturers to study the conditions that prevail on the spot in company with Mr. T. Adams, the secretary. From the motoring point of view everything is admirable. The roads that have been constructed have a splendid surface and should serve as an example to many local authorities throughout the country.

**Where Roads are Wide.**

LETCHWORTH is favoured by the proximity of the Great North Road, which runs along the outskirts of the estate on the east, and is familiar to motorists from the north and the south. It is the intention of the company that is responsible for the enterprise, and which is dealing with the matter in a thoroughly practical and businesslike way, to make the majority of the new roads, upon which a start has been made, from 40 ft. to 60 ft. in width; thus ensuring provision for the motor-car traffic that is expected to be a regular means for the conveyance of both people and goods in the near future. Then, too, regard will be paid to the straight course and sharp turns obviated as far as possible, thus enabling motorists to have glorious spins along roads which will not be required as the playgrounds of the people. Open spaces will be provided for the children. In fact, it may be quite easy to secure a good stretch of road for testing speeds, and doubtless the authorities would be able to arrange for a "close time" for motorists if any real desire were manifested.

dust question that are even more important, affecting as they do the health of our people, for unfortunately germs and the conveyers of disease are thus disseminated throughout the country, to the consequent risk of the populace. The condition of the streets, thanks in a large measure to the horses used in traffic, is often much to be deplored, and the constant churning of debris into small particles maintains a source of contagion and risk. The coming of the motor-car will obviate at least one cause of disease and danger to the people.

**An Indian Run.**

THOSE unacquainted with India can scarcely realise the progress that is being made by automobilism in the Dependency. Not only do owners of cars abound, but motor-cyclists are an increasing number. The driving is not confined to Anglo-Indians, natives taking an intelligent interest in mechanical matters, and rapidly becoming expert in the handling of machines. A motor-cycling contest had been held just before the mail left between Poona and Kolhapur over a 340-mile

A Motor Cycle Trial in India.

**An opening for the Motor-car Industry.**

So much for the charms of Letchworth from a motoring point of view. They are even more substantial in the eyes of those searching for a locality where rates are reasonably low, the authorities willing to please, and the railways anxious to assist the future competition of the motor-car by facilitating the conveyance of raw material from its home to the place of construction into cars. Such a place is Letchworth. Here, thirty-three miles from London, is a place where land can be obtained adjoining a railway side at ground rents ranging from £10 to £25 per acre, where roads, etc., are already made, where rates are less than half what they are in the most favourable Metropolitan area, and where gas is supplied at rates to make the London consumer envious. Already half a dozen factories are being erected, and we look to Letchworth as having a fine promise of becoming a busy hive of successful industry.

**Dust.**

THE physical inconvenience attaching to the production of clouds of dust by the rapid passage of motor-cars over loosely constructed roads is recognised by all who travel. There are, however, other dangers lurking in the

course. There were twenty entries, of which rather more than half were from Bombay. Fourteen started in the Reliability Trials, the contest being won by Lieutenant Henderson on a 3½-h.p. Brown machine. A notable feature of the entrants was the large proportion of native riders.

**Motoring in Bermuda.)**

A SERIES of regulations apparently largely based on those prevailing in this country have recently come into operation in the island of Bermuda. The main provisions are as follows: Every vehicle weighing more than 5 cwt. must be provided with a reversing gear, and all cars must have two independent brakes, each capable of locking the wheels. Between one hour after sunset and one hour before sunrise each vehicle must carry two white and one green (in the centre) lamps showing a light in the direction the car is travelling, and two red lamps showing in the reverse direction. In the two principal towns of the island and on certain narrow roads, bridges, etc., the speed is limited to six miles per hour. Owners and drivers of cars must obtain a driving licence from the registrar of the island, the charge being £1. All cars are required to carry rectangular licence-

number plates showing the number of the car in white on a black background, one plate to be attached to the front and one to the rear of the car. Any violations of the law are punishable with a fine not exceeding £20. A correspondent in Bermuda writes that "at present the island is almost devoid of motor-cars, there being only five steam vehicles, and of these only one is in going order. There are about 125 miles of good roads with a fine hard surface—all made of coralline limestone; they are practically always in fine condition, as even after a day's hard rain they are dry after less than an hour of sunshine. In fact the roads, if they were not quite so narrow, would be ideal for short trips."

#### Opening Garages.

FROM correspondence received during the last few days it would seem that a goodly number of people are anxious to set up establishments for the garaging of cars and the repair of automobiles. Several questions have to be considered in replying to the queries raised. Firstly, of course, care has to be taken that there is a minimum of existing competition. The location of the garage as to town and site is also an important factor. As motoring becomes more universal there will, of course, be plenty of work throughout the year for all engaged in the business, but in the present order of things those prepared to cater for the motor-car industry must be content to endure a slack time during the winter. Hence the advisability of having premises situated on busy main roads, thus being eligible to deal with the troubles of passing motorists. We shall be pleased to hear from practical motorists living in districts where garages or repair shops could be opened with the possibility of success to persons knowing their business.

#### The White Car.

THE pleasure and utilitarian aspect of the White steam car has been prominently brought to our notice recently. The "Sphere" has a spirited drawing by Mr. Arthur Garratt representing a snow-scene in the Park. One "White" car is standing by the side of the road, and its load of children are disembarking from it. Another "White" car, also loaded with children, is bowling merrily along the roadway. The children in one car are waving their kerchiefs at the children who are standing by the other. So much for the artistic view of the matter. The illustration on page 76 of one of the 15-h.p. White delivery vans used by a well-known London firm. Originally the chassis on which this van has been placed figured in the Tourist Trophy competition; now that it comes into range with ordinary Metropolitan traffic it wears a more useful garb.

#### Advance in Australia.

IN Australia good work is being done by the Roads Improvement and Touring Association, which has headquarters at Melbourne. Its primary object is to direct the attention of the citizens to the neglected condition of the common roadways of the State, to demonstrate that the present methods of construction are wasteful, to advise that the Government should take over and maintain the main trunk roads as a national work, and to drive home to the people the fact that roadways are at least as necessary as railways. But the Association is not only educational, it is eminently practical, and has constructed many stretches of smooth cycle pathways where the local authorities have been inordinately neglectful of their duties. It is now engaged in joining up some of the towns in Victoria by wider roadways than now exist, and the formation of a motor racing track at Aspendale has quickened enthusiasm for that work. This track has been laid down at an expense of £1,700, and the inaugural race meeting was a great success, more than a score of cars entering in many of the events.

#### More Conversions.

LAST week we recorded the "conversion" of churches to the purposes of motor garages; an even more curious trend of the times is the acquisition of an old tramway depot for a similar purpose. This has occurred at Leeds, where the whilom premises of the Leeds Tramways Company are now in the occupation of the Motor and Electrical Engineering Company (Leeds), Limited, and used as a garage. The inroads that the motor-bus is making into the popularity until now enjoyed by the tramcar will doubtless lead to many other similar changes of this kind—all indicating a great advance in public mobility, and constituting a justification of those who have urged local authorities to cease expenditure on tracks in the roadway and look to the motor-bus as a way out from the present congestion of traffic.

#### Knowledge at the Stands.

EXHIBITORS at the Agricultural Hall Show will probably be struck with the general knowledge of automobile matters displayed by a large proportion of the visitors. There was a time when practically everyone who went to see a motor-car exhibition revealed a delightful nescience to the bewildered stand attendant. Now this is greatly changed, and the intelligent curiosity of the public requires that those who seek to enlighten visitors to automobile shows shall be fully primed with information not only regarding their own particular exhibits, but also concerning the trend generally of automobile design and practice.

AMONG those who have recently ordered Crossley cars from Messrs. Jarrott and Letts, Limited, are the Baron Bruno Schroder, Mr. C. H. Whittington, and Sir William Gull, Bart. The carriage bodies are all being built by Messrs. Hooper, the vehicle for Baron Bruno Schroder having a large limousine capable of carrying six persons, fitted up with electric light and armchair seats. Mr. Whittington's 40-h.p. car will be fitted with a large three-quarter landaulet, whilst Sir Thomas Gull is having a large limousine with detachable top.

MESSRS. A. PROBYN AND CO., the official caterers to the Royal Agricultural Hall, notify us that the whole of the catering arrangements are now under the experienced management of Mr. F. Turner, M.C.A., who has secured the services of a chef from Messrs. Ring and Brymer, who will pay every attention to that department. The public generally may rely on prompt and efficient service. Luncheons, dinners and teas will be served in the dining room at the hall, and tables can be reserved for large and small parties on application. The telephone number is 688 North.

A NEW series of cars known as the "Leon Dussek" is being put on the English market by "Motoria," of Hanover Square, London, W. Three sizes are being made—16-20-h.p., 24-30-h.p., and 35-45-h.p.—all fitted with four-cylinder engines. The valves are located on opposite sides of the separately-cast cylinders, and are all mechanically operated. The bottom half of the crank case can be readily removed without disturbing the bearings, to enable the big ends of the connecting rods to be inspected. Both Eisemann high-tension magneto and coil and accumulator ignition are provided. The radiator is of a special type, and is equipped with a large air-inducing fan. As regards the transmission, this can be either by side chains or a cardan shaft; the change-speed gear is operated by a lever working in a "gate" quadrant. Ball bearings are fitted to all the shafts, with the exception of the motor. There are a number of special features in the Leon Dussek cars which pressure on our space prevents us referring to this week, but we may add that the cars are being turned out with roomy side-entrance bodies, Cape hoods and glass front, and all necessary fittings to render them ready for the road.

## OFFSET CRANKSHAFTS.

### A TOPICAL QUESTION IN PETROL MOTOR DESIGN.

**A** MATTER of considerable importance in the construction of single-acting internal combustion engines, more especially those of high or moderately high speeds, is evolved by an apparently growing tendency on the part of designers to so construct their motors that the crankshafts are set over in such a manner that their axis is in advance of the axis of the cylinders. The idea is not new, and, moreover, is open to argument; but the fact that several leading foreign makers are adopting the system is apparently creating more impression than has one or more isolated instances in this country. Departures from standard design of well-known motors, if introduced tentatively and merely for the sake of novelty, would soon die a natural death; and it behoves disciples of a new, or at least unconceded doctrine, to be prepared to stand the assaults of more or less carefully ground axes. Not only that, but they must be prepared to show with an approach to logical argument that there is something in the idea to merit serious attention.

Fig. 1.—The Brasier.

Fig. 2.—The Moss.

Fig. 3.—The Ailsa Craig.

### SECTIONAL VIEWS OF PETROL ENGINES WITH OFFSET CRANKSHAFTS.

Fortunately this particular question of offset crankshafts is a very simple one, and can be explained without resort to intricate technical demonstration. To start with, it involves absolutely no complication of any kind, not one screw or pin being added to the engine; and, on the contrary, in motors in which all the valve-actuated mechanism is on one side the design lends itself distinctly to compactness and simplicity. To put the matter broadly, the adherents of the offset or *désaxé* doctrine—for, as our neighbours have copied us, we must needs copy them by borrowing their word to express our admiration for their ingenuity—have in view a double object, and that is, while obtaining as much effective power with a given cylinder capacity, at the same time to produce a more even-running engine. Simple diagrams show that these objects are attained theoretically to a certain extent, and it is obvious to the most casual observer that, in practice, admitted that in one revolution of an engine the very slightest advantage be obtained in these respects, then, as the engine piles up its advantages at, say, the rate of 1,000 per minute, the gain in power and economy of fuel, not to speak of less wear and tear at the end of a year, is well worth considering. It will, we think, be generally conceded that an important stroke

to consider in an explosion motor is the firing stroke. We say generally conceded advisedly, because the opponents of the idea point to the compression stroke as nullifying any advantage gained in the offset system during the working or explosion stroke. Now, as in single-acting explosion motors there is no piston-rod—the guidance of which in a gland and slipper guides in a steam engine relieves the piston of all side thrust on the cylinder walls—the piston itself has to receive direct all the side thrust caused by the necessarily oblique position of the connecting rod. This side thrust must without doubt be the most serious import during the maximum effort of the explosion stroke, and therefore if we can considerably reduce at this time the oblique position of the connecting rod by placing the cylinders out of the vertical centre with the centre of the crankshaft, say one-sixth of the stroke in advance of the direction of rotation, we reduce friction, and, as a natural consequence, gain power to the extent that we reduce the friction.

A curious paradox in offset practice, and which at first strikes one as an anomaly, lies in the fact that the stroke is longer than twice the throw. This can easily be proved mathematically, or demonstrated by a simple experiment with two pieces of cardboard and two drawing pins. It will be found that the stroke is increased by prolonging the difference of axes. But in practice a limit must be set to this, as the benefit

of turning moments is sacrificed, and we have to find by actual tests the point at which the various advantages and disadvantages appear to balance. Another factor, however, should be here carefully noted, which is distinctly in favour of offset practice, and which, added to the greatly lessened friction by obviating the side wedging action during the explosive effort, compensates for the lessened turning moments alluded to. This refers to the fact that the thrust during this period, both on the gudgeon pin, connecting rod bearing, and crankshaft journals, is considerably reduced; here again avoiding excessive friction, and conducting greatly to the longevity of these parts, and to the sweet running of the engine. For it must be borne in mind that the area of, say, a gudgeon pin has a much less margin or factor of safety in an explosion motor during the first part of the working stroke than in a steam engine; in fact, in many motors it is quite inadequate, and therefore a fruitful source of trouble. A still further point is put forward as regards the question of compression; for it is argued that the final effort of compressing the gases is done—quicker, owing to the fact that the piston has to finish its upward stroke at a greater speed when the crankshaft is set forward. This is a very much greater advantage than would at first sight

appear, for its results are threefold. In the first place, it is without doubt advisable to retain the heat of the gases due to compression until the moment of ignition, otherwise energy is sacrificed. Secondly, however perfect an engine may be when new, a certain amount of compressed gases may escape, past the valves and pistons, and the longer the period during which they have a chance of escaping the more risk there is of losing some. Thirdly, a much better compression effect is obtained, and this, of course, alone would constitute a very decided advantage.

The question of ignition must also be noted. It appears in practice that in offset cylinders the engine can have the spark more advanced than in those not so arranged, particularly when the engine is pulling a load at a slow speed. On making a diagram to observe the benefit as to the reduction of side thrust, it is necessary to notice the two curves, and it will be seen that from start to finish the off-set system scores easily, and at the most important period the difference in its favour amounts to no less than 50 per cent. As the pressure at the moment of explosion may be nearly 400 lb. per square inch, it can easily be realised what enormous friction may be caused by oblique thrust, and that a very considerable amount of power may be thereby absorbed. If, on the other hand, we can reduce this, we not

## USEFUL NOTES.

THE entire wiring of a car should be carefully examined from time to time for signs of wear in the insulation. At certain places the wires are exposed to continual, if slight, friction, which will ultimately break through the insulation and establish a short circuit. The timely application of a little insulating tape will often save much trouble in this respect.

It is well to occasionally examine the couplings and fittings on the oil and grease pipes on one's car, to see that there is no escape that would rob any bearings of their due supply and so cause overheating. A leak in a pipe of a multiple lubricating device is much more serious than a leak in a separate cup-system, because it allows the reserve supply of lubricant to flow out and thus prevents sufficient pressure being applied to force the oil to the other bearings, which suffer in consequence.

SOME motorists test the spark of a motor by removing the high-tension wire from the plug and holding it near the frame when contact is made. This method is all right so long as the wire is held quite close (about 5-16 in.) to the frame. If the wire is held some distance away a large spark may certainly be

Fig. 4.—Sectional View of Duryea Motor with Offset Crank Shaft.

only save power directly, but by practically equalising it with the side thrust during the compression stroke (for it must be remembered that although the obliquity is more here the pressure is much less) we make the engine more perfectly balanced and the torque more constant.

These points, therefore, give the designer scope in a direction that enables him, if he desires, to reduce both the height and weight of his motor. For, inasmuch as a long connecting rod is solely necessary in co-axial construction to counteract the wedging tendency on the cylinder walls, designers are logically entitled, by adopting a system that reduces this tendency, to shorten their connecting rods and cylinders until a point is reached that coincides with the former practice. It is probable that there may be other points in favour of this construction that have escaped mention here, but those that are indicated may suffice to show that the adoption of off-set crankshafts is based on principles worthy of attention.

C. R. G.

MESSRS. WEST, LIMITED, have appointed Messrs. Ninci and Graziani, of Bologna, the agents for West cars in Italy.

produced, but the coil may be injured, as the insulation can easily be broken down in this way.

MESSRS. GROUVELLE AND ARQUEMBOURG, the well-known makers of ribbed-tube radiators, have lately given their opinion as to the best method of cleaning out these devices. They write:—"In reality it is very rare that any incrustation forms in the pipes of radiators, as incrustation only takes place when the water is at boiling point, which ought not to take place in a radiator. When it does, it is an indication that the radiator is not large enough. The same remark does not, however, apply to the water-jackets of the motor, where the water often reaches a very high temperature. In cases where incrustation does happen to form in radiators, a small quantity of hydrochloric acid should be added to the water, and this caused to circulate for a time, making sure afterwards to thoroughly remove all traces of the acidulated water." Messrs. Grouvelle and Arquembourg point out that while incrustations are rare, deposits are frequently formed on the internal walls of the pipes, due to impurities in the water. These can, however, be removed by sudden injections of water by means of a pump.

## SOME CURRENT TOPICS.

### Offset Crankshafts.

The fact that the Brasier Company has followed the example set by other well-known concerns in adopting off-set crankshafts for the engines of their 1906 cars has, judging from the letters which have recently appeared in our correspondence columns, evoked considerable interest not only among automobile designers, to whom the matter more directly appeals, but also amongst motorists generally. As the various text books on the design of internal combustion engines deal with the question but briefly, the article we publish elsewhere in the present issue should prove useful and instructive. It is from the pen of a well-known engineer, who, while admitting that the subject is one on which opinions are divided, is in favour of slightly off-setting the

lighter paraffins, such as that sold as "petroleum ether," may be intended; this consists largely of pentane, which has been used experimentally as an engine fuel, but as nothing seems to have been heard lately regarding these experiments, which were proceeding three or four years ago, they were presumably without much result.

### Increasing Engine Power.

The only substance which, as far as we are aware, has been used with some success to increase engine power is picric acid, though what risks—either of cylinder corrosion or damage by excessively violent explosion—may be run in using it is a disputed point. We have not heard of the latter accident, though the former has come under our notice. The rationale of its action is obscure and somewhat contrary to theory; probably it is due to an increase in the rapidity of combustion.

### The Grand Prix de l'A.C.F.

The rules for the international race for the Grand Prix de l'A.C.F. have at last been issued. The contest is to be held on

THE PASSING OF THE HORSE.

At the recent Automobile Exhibition in Amsterdam Messrs. Verweij and Lugard, the Dutch agents for the Fiat Co., attracted much attention by parading half a dozen horses in a Fiat motor Lorry. [De Auto.]

crankshaft, and who endeavours to explain the advantages gained by such a departure from the usual practice. In connection with the article we have given sectional views of all—so far as we can ascertain—the different motor-car engines at present in use having offset crankshafts.

### Ether as a Motor Fuel.

In our Correspondence columns this week "Go Ahead" puts some queries as to the use of ether as a fuel for internal combustion engines. We are, however, not aware of any recent experiments in the direction named. If ordinary ethyl ether is intended, its thermal value is approximately double that of alcohol, and therefore does not differ much from that of petrol; its price is prohibitive, and, boiling as it does at about 93 deg. F., it would be an awkward and dangerous liquid to carry on a car and difficult to supply to a carburettor without considerable loss. Its specific gravity when pure is 720, and its price varies from 1s. 2d. to 7s. per lb. according to purity. Possibly some of the

the Sarthe circuit and will extend over two days, June 26th and 27th, a distance of 600 kilometres (375 miles) having to be covered each day. Manufacturers will be permitted to enter a maximum of three cars, vehicles built by different firms under licence being considered as one type. Entries will be received by the A.C.F. up to April 30th at the rate of £200 per car, and from that date to May 15th at £400 per vehicle. Rule 9 provides for a change of drivers, if desired, on the second day of the race, and for a change of mechanics at any control on either day. All the chassis must be fitted with a reverse motion, and must not exceed a weight of 1,000 kilog, an extra allowance of 9 kilog being made in the case of those fitted with magneto ignition. At the end of the first day's run the cars will be locked up in separate compartments, and access to them will not be permitted until the starting time on the second day, the time occupied in filling up with fuel and water counting in the running time. All work of this kind, as also all repairs, must be effected by the driver and mechanic.

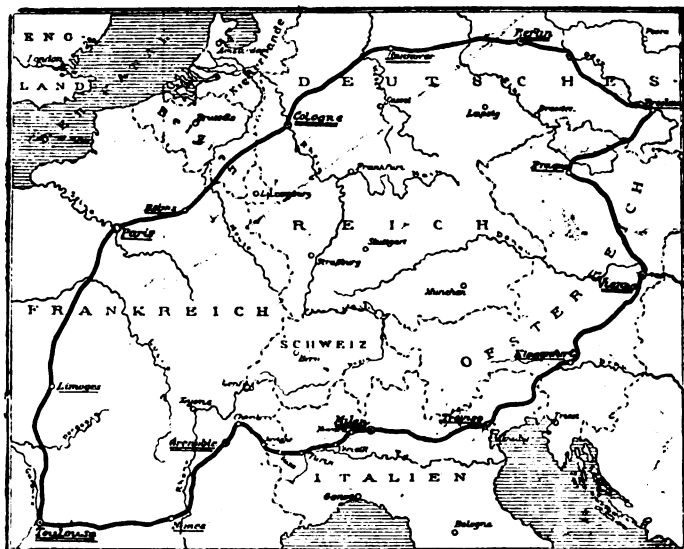

## CONTINENTAL NOTES.

## Entries for the Grand Prix Race.

Already three Darracqs and an equal number of Panhard and Brasier cars have been entered for the Grand Prix race. Hemery, Wagner and Hanriot are designated as the drivers of the Darracqs; Heath, Teste and Tart of the Panhards; while Baras, the old Darracq driver, Lebrun and Barillier will handle the wheels of the Brasier racers. Barillier and Lebrun are foremen in the Brasier works and are reported to be expert *chauffeurs*. No information is available as yet as to the details of the cars the Darracq Company have entered, but it is reported that the Panhard vehicles will be similar to last year's type with a slight increase in engine power, and that the Brasier vehicles will be on the lines of the Gordon Bennett winner of 1906 with a slightly lower centre of gravity.

## Le Circuit European.

The full rules and regulations of the great international touring contest known as Le Circuit European, and which is to be held in July and August next, were issued last week. The principal clauses are similar to those which have already been given in the *M.C.J.*, the classification of the competing cars being based on the piston area of the cylinders. The distance to be covered in the trial is 5,000 kilometres, divided into fifteen stages of from 250 to 400 kilometres, exhibitions being organised in the chief towns to be passed through. We give herewith a

Route Map of the Circuit European.

map of the route. The start will take place in Paris, the towns forming the daily stages being underlined, those with a double line underneath being the places where a day will be spent for exhibition purposes. A Wolseley, two Darracqs, two Dixis, four De Dions, and two Mercedes cars have already been entered for the event.

## The Cannes Automobile Meeting.

The motor-car competitions in connection with the Cannes automobile meeting commenced on the 13th inst. with a consumption test, in which ten cars took part. A litre of spirit was served out to each competitor, who had to drive round and round the Square du Masque de Fer, Cannes, until his engine came to a stop. M. Mounier, on an 8-h.p. Renault, succeeded in covering the greatest distance—10½ kil. in 28 min., M. Gallice, on a 12-h.p. Clement, being second—10.3 kil. in 29 min. A brake contest on the Adrets Hill was held on the 14th inst., the competitors having to stop their cars on the descent as quickly as possible after a given signal. M. Mounier, on his 8-h.p. Renault, again took the first place, he pulling up in 16 ft., a 25-h.p. Hotchkiss being second, 23 ft. The programme on the 15th inst. consisted of a kilometre speed trial on the level and a hill-climbing test. The former was held on the Cannes-Frejus

road, and was won by M. Grigg, who on a 35-h.p. Daimler covered the distance in 40 sec., equal to 56½ miles per hour, a 25-h.p. Hotchkiss being second in 56 sec. M. Grigg also won the hill climb, notwithstanding that his 35-h.p. Daimler carried seven persons.

## Motor Racing in Spain.

A motor-cycle race for a trophy presented by Senor Sama, who is desirous of encouraging motor-cycling in Spain, is to be held on Sunday next. The course to be covered measures about 150 miles. Arrangements are also in hand to organise a motor-car race from La Corogne to Ferrol in August next. Prizes to the value of £1,200 have already been offered.

## A Tour of France Reliability Trial for Motor-cycles and Voiturettes.

The Autocycle Club of France is organising a reliability trial for motor-cycles, tri-cars, and voiturettes, to be held from the 12th to the 24th May next. The competition will consist of a tour of France, the first day's run being from Paris to Orleans, 129 kil.; the second day's ride (May 13th) is from Orleans to Poitiers, 218 kil.; the third, from Poitiers to Bordeaux, 246 kil.; the fourth, from Bordeaux to Toulouse, 254 kil.; the fifth, from Toulouse to Montpellier, 254 kil.; the sixth, from Montpellier to Marseilles, 168 kil.; the seventh, from Marseilles to Avignon, 121 kil.; the eighth, from Avignon to Lyons, 225 kil.; the ninth, from Lyons to Besancon, 212 kil.; the tenth, from Besancon to Nancy, 194 kil.; the eleventh, from Nancy to Rheims, 195 kil.; the twelfth, from Rheims to Amiens, 179 kil.; and the thirteenth, from Amiens to Paris, 139 kil. The competitors will be divided into four categories—(1) Motor-cycles, the engines of which have a cylinder capacity of a third of a litre; (2) ditto, of a maximum of 225 cubic centimetres; (3) tri-cars, of a maximum cylinder capacity of 500 cubic centimetres, which must carry a minimum load of 140 kilogs.; and (4) light two-seated cars, maximum cylinder capacity one litre. The competitors will be required to attain a maximum and minimum speed of respectively 30 and 15 kilometres per hour. So far, three Gregoires and two Vulpes voiturettes and a Quentin and three Austral tri-cars have been entered.

## A German Touring Competition.

The Cologne Automobile Club is organising a two days' touring competition for the 19th and 20th May next. On the first day the route is from Cologne to Coblenz *via* Homburg, a distance of 175 miles, and on the second day from Coblenz to Cologne *via* Hembach, 112 miles.

## Miscellaneous Items.

The Deutscher Motor-boat Club has just been formed in Berlin to foster the motor-boat movement in Germany.—Messrs. Panhard and Levassor are introducing a new shock absorber devised by Commandant Krebs.—The A.C.F. has adopted a resolution in favour of organising a competition for electrical vehicles during the coming summer.—It is stated so far only one firm of French motor-car manufacturers has signed the special agreement with Messrs. Renault Freres with regard to the direct drive patent.—The date of the Circuit des Ardennes race has been fixed by the Belgian Automobile Club as August 13th next.—The largest motor-car exhibition so far held in Austria was opened in Vienna on the 15th inst.—Owing to the paucity of entries the competition of silencers for motor-cycles which the motor-cycle section of the Austrian Automobile Club proposed to hold has been cancelled.—The kilometre contest for the Sneden Cup, organised by the Algerian Automobile Club, was run off on Sunday last, the winner being M. P. de Maglaive, who on a Paris-Madrid De Dietrich covered the distance in 35.15 sec.

## Instructing the Children.

The Prussian Minister of Education has issued instructions to the authorities of the various schools in Prussia that they should from time to time warn the scholars of the care they should take in crossing roads, owing to the increasing automobile traffic, and the risks they run in playing in busy thoroughfares.

# The Critchley-Norris Motor-Omnibus.

ONE of the latest additions to the list of British motor-omnibus builders is the Critchley-Norris Motor Company, of Bamber Bridge, near Preston, whose vehicles are making their public debut at the Cordingley Show at the Agricultural Hall. Two sizes are being made, viz., 25-30-h.p. and 35-40-h.p., but, as the general arrangement is on similar lines, the following description of the more powerful chassis may be taken as applying to both. The object of the designers has been to produce a vehicle which will be able to withstand in a most efficient manner the strains and stresses which are set up in the working of motor-omnibuses, owing to the continual starting and stopping and the continuous work they are called

inspection doors and efficient arrangements for lubrication, and also special fittings for collecting any surplus lubricating oil. The crankshaft is of nickel steel, accurately turned and balanced. Particular attention has been devoted to the bearings, which are of Crossley special phosphor bronze. The length of the main journals is two and a half times the diameter, thus giving great stability and long-wearing surfaces. The inlet and exhaust valves are mechanically operated by separate cam shafts, which rotate in special oil-tight cam shaft chambers. The valves are of nickel steel, and designed both as to area and lift to allow for an air or gas velocity in proportion to the area of the cylinders. The carburettor is of novel design. It is of the float feed spray

Fig. 1 and 2.—Elevation and Plan of Chassis of Critchley-Norris Motor Omnibus.

A Lever controlling both ignition and throttle.  
B Change Speed Lever.

D Clutch Pedal.

E Hand Brake Connections.  
F G Foot Brake Connections.  
H Differential Shaft Brakes.

I Rear Wheel Brakes.  
J Rear Longitudinal Springs.  
K Transverse Rear Spring.

upon to perform. The motor, gear-box, and the spring hanger brackets are secured to the main frame, which is of channel steel, having a section of  $4\frac{1}{2}$  in. by  $2\frac{1}{2}$  in. by  $\frac{1}{4}$  in. As will be seen from the plan view, the sides of the frame are quite straight, while strong cross stays are provided. The springs, which are of good length, are five in number, the usual longitudinal set being supplemented by a transverse spring at the rear.

The motive power is supplied by a Crossley four-cylinder engine; the 25-30-h.p. type has cylinders  $4\frac{1}{2}$  in. diameter by  $5\frac{1}{2}$  in. stroke, the dimensions of the 35-40-h.p. engine being  $4\frac{1}{2}$  in. by 6 in. A description of the last-named motor, together with illustrations, was given in the *M.C.J.* of February 3rd last, so that it need only be briefly mentioned that although the normal speed of the engines is 800 revolutions per minute, they are capable of considerable acceleration, and can be run at 1,100 revolutions. The aluminium base chamber is fitted with

type; while automatic in its action, there is only one air inlet, which is opened or closed entirely by the suction of the engine, and at the same time the supply of petrol is increased or decreased in the proper proportions at all speeds.

A feature of the water circulation, which is maintained by a gear-driven centrifugal pump, will be found in the main water pipes, which are 1 inch internal diameter, the friction of the water through the pipes being thus reduced to a minimum. The radiator, of which two views are given in Figs. 4 and 5, is an entirely new departure. As will be seen, it consists of a central receptacle into which are screwed a series of independent sealed tubes containing spirit in partial vacuum. The cooling of the water is effected as follows:—The hot water which flows into the receptacle heats up the spirit tubes until part of the spirit evaporates; the vapour thus formed rises along the tubes, in the outer ends of which it is condensed, owing to the action of

the air on the radiating fins. The vapour, once more converted into spirit, flows back to the bottom or inner end of the tubes, ready to be again heated, and, consequently, abstract further heat from the water. In this way a continuous circulation of the spirit in the form of liquid and vapour is kept up by the heat withdrawn from the circulation water, which is thus maintained at the desired temperature. The efficiency of this type of radiator is claimed to be very great. The construction is also

Fig. 3.—Sectional View of Crossley Motor.

such that the liability to leak, owing to vibration or jolting, with the consequent loss of water, is eliminated. The radiator tubes in case of damage are easily replaced, and in the event of a tube being injured, only one unit of the radiator is affected, and, consequently, the general efficiency of the cooling device but slightly interfered with. A belt-driven fan running on ball bearings is provided, to draw a current of air through the radiator.

The ignition is by a gear-driven Simms-Bosch low tension magneto. The make and break mechanism is of substantial construction, and the point of firing can be advanced or retarded. Provision is also made to permit of the sparking in each cylinder to be tested independently. The gear wheels driving the cam shaft, magneto and pump are all enclosed in oil-tight covers. Special attention has been devoted to the question of lubrication; all the engine bearings are fitted with ring lubrication. The main oil tank is fitted to a distributor on the front of the dash board, the oil being forced through the pipes by air pressure.

(To be continued.)

THE Fiat Motor Omnibus which recently did so well on its trial trip was fitted with "Royal Sirdar-Buffer tyres."

A 30-h.p. Prunel double-deck bus has just successfully made the journey by road from Paris to London, excepting, of course, the sea trip across the Channel. The vehicle started from Paris on Friday of last week from Boulogne, where it was shipped to Folkestone. On Tuesday morning the omnibus started the second stage of its journey by road. Ashford was reached at 11.55, and Maidstone an hour and a quarter later. London was reached at 7.50 p.m., the seventy-two miles from Folkestone to London having been covered in less than seven hours' actual running. We may add that the vehicle is on exhibition at the Cordingley Show.

## COMPENSATING ATTACHMENT FOR CARBURETTORS.

IT is hardly to be doubted that to the improvements in carburettors which have been made within the last two or three years is attributable a large part of the betterment in the operation of petrol motors which is now so noticeable. The adoption of the automatically-controlled auxiliary air inlet, and later of the automatic main air intake, which compensates for those changes of vacuum at the spraying jet which arise from variations in the rate of air flow, have gone far toward the perfection of the carburettor as a reliable gas supply, almost independent, as to its effectiveness, of the rate of demand. Automatic control of the main air supply at or near its point of entrance by means of a spring-actuated valve, or, in some instances, by a swinging vane, seems at present, remarks an American contemporary, to be the preferred method of compensation, as it ensures good results without any considerable increase of complication.

Users of cars fitted with the older forms of non-compensated carburettors are naturally desirous of improving the operation of their engines under widely varying degrees of throttle opening, and fortunately the market offers a variety of compensated carburettors applicable to almost any motor, among which a selection may be made to suit individual conditions. In fact, it may not be necessary in all cases to purchase a complete new carburettor in order to secure the valuable results which accrue from a gas supply of substantially uniform quality, as there is already on the market an attachable automatic air valve designed to be applicable to existing uncompensated carburettors of a variety of forms and sizes. This little device comprises a poppet valve fitted with an adjustable spring which may be so regulated as to open in such proportion to the entering air that the desired vacuum at the spraying jet is said to be approximately maintained. There seems no reason why the action of an uncompensated carburettor might not be considerably improved by resort to the use of a simple device of this kind, although it is hardly to be

Figs. 4 and 5.—Sectional Views of Critchley-Norris Radiator.

expected that the results obtained would be equal to those obtainable with a modern carburettor consistently designed throughout.

AN English resident in India recently took a Turner-Miesse car about 700 miles in one week. The run included the Kohat Pass, where the road rises 1,200 feet in four miles. The car went over it without stopping. No great speed could be maintained owing to bad roads, but the average was generally fifteen or sixteen miles an hour, including all stops for water, etc. The owner's best run was 106 miles, from Rawal Pindi to Peshawur, in a little under seven hours, including two stops for water.

FOR the Scottish Reliability Trial the entries, which do not close till May 2nd, already number twenty.

WITH reference to the trials of tyres, speedometers, and lamps now proceeding under the auspices of the A.C.G.B.I., things have been going smoothly during the past week; but it would be premature to add to what has already been written on the subject.

THE offices of the Reliance Motor Transit Company, registered with a capital of £25,000, are at 9, Wool Exchange, London, E.C.

ON Saturday the road sign at Grove Hill, Harrow, was painted green, the ring and tablet surmounting the post bearing the unauthorised warning, "Beware of police traps."

A LIST of the spare parts of the 16-h.p. Albion car has been prepared by the makers, which will enable users abroad or at home to telegraph for the prompt supply of parts wanted urgently.

MESSRS. J. KEELE AND CO. are arranging a large and attractive exhibit of Spyker and Darracq cars at the Cordingley show, a notable feature of which will be the landaulet illustrated herewith. The vehicle

has been introduced to meet the growing demand for a covered car for touring or town work at a moderate price. The body is of English construction, and is designed on neat roomy lines, and is luxuriously upholstered, so that it should meet the requirements of a large section of the motoring public. The chassis on which the body is mounted is of the Darracq standard 10-h.p. type, fitted with double-cylinder engine 100 mm. bore by 120 mm. stroke. The valves are all mechanically operated, and the ignition is by coil and accumulators. The transmission is by means of a special form of leather-faced cone clutch to a gear-box giving three speeds forward and a reverse, with direct drive on top speed. The final drive is by means of a cardan shaft and bevel gear on to a well-stayed live axle.

FROM Messrs. Friswell, Limited, comes a copy of a new French catalogue of Peugeot cars. This is not only a highly artistic production, but is at the same time of a practical character, as it includes not only full particulars of the vehicles, but well-executed line and half tone illustrations of the principal parts of the mechanism.

AT the next general meeting of the Continental Caoutchouc and Gutta Percha Company, a dividend of 40 per cent. will be declared, as against 33 1-3 per cent. in 1904. The turnover during the past year has been far in excess of all previous records, and the output for January and February this year also shows a great increase over that of the same period in 1905.

THE Maudslay Motor Company, Ltd., who are building a number of double-deck motor-omnibuses for the Scottish Motor Traction Company, despatched one on Thursday the 8th inst. on a non-stop run from Coventry to Edinburgh with a 30-40-h.p. omnibus, with six passengers and supplies. Rain interfered considerably with the trip, while, after crossing the Border, snowstorms were encountered. Notwithstanding this, the journey was successfully accomplished in just over twenty-five hours.

## HERE AND THERE.

ENTRIES or the British team for the International Motor-Cycle Cup Race close on the 31st inst.—the last day of the Agricultural Hall exhibition.

MR. HAROLD ARKWRIGHT has supplied Daimler cars to the Maharajah of Mysore, the Maharajah of Durbhunja, and the Rajah Nanshal Ali Khan.

THE Nottingham County Council have placed an order for a 15-20-h.p. Horbick car with Messrs. Horsfall and Bickham.

THE Burke Engineering and Motor Company has been registered with a capital of £6,500, and offices in Parnell Street, Clonmel, co. Tipperary.

THE general manager of the Great Southern and Western Railway of Ireland, Mr. C. H. Dent, has become a motorist, having ordered a Humber four-cylinder car.

THE Scottish district delegate of the Amalgamated Society of Engineers, in his official report to the Society, adds his testimony to the progress of the motor-car industry north of the Tweed.

MR. R. F. DAVIS has opened a garage and motor works at 20 and 21, Buckwell Street, Plymouth, where he teaches driving,

repairs tyres and charges accumulators. The workshops are well equipped to deal with all classes of repair work and are in charge of an expert tester from a well-known automobile firm.

THE Automobile Omnibuses, registered with a capital of £1,000, is the title of a company registered to supply motor vehicles and to adopt an agreement with Mr. E. M. Davey. The office is at 18, Fleet Street, E.C.

ON Tuesday, the 27th inst., at 3 p.m., Messrs. Reynold Jackson and Co. intend to entirely dismantle, at their stand at Cordingley's Show, the original Jackson dog-cart which went through the Hereford Trials. The car has been in daily use

and has travelled over 15,000 miles. The total cost of repairs, with the exception of tyres, has, we are informed, been under £1 5s.

WE learn that the Fabry Automobile Company have secured an order for a 50-70-h.p. Itala car from Sir Thomas Lipton.

PRYCE TROW is the title of a company formed to take over the business of a cycle and motor-car manufacturer carried on at 55, Oxford Street, Swansea.

WE learn from Clement Talbot, Limited, that from their works in North Kensington they produced and sold £15,000 worth of British Talbots during January, and it is expected that the average in future will be £20,000 per month. An extension of the works is under contemplation which will double their productive capacity.

MESSRS. J. AND R. OLDFIELD, lamp manufacturers, Warwick Street, Birmingham, have just arranged to occupy the adjoining premises, which will double their factory space and enable them to cope with the demand for their "Dependence" tail lamp. This alteration will also secure the utilisation of a suite of offices in Bradford Street. Their latest production is an electric side light, which possesses special features, and will be exhibited at the Agricultural Hall Show next week.

A Darracq 10-h.p. Car, with special English-built body.

THE Coventry Engineering Society have paid a visit to the Daimler Motor Company's works at Coventry.

THE shipments of motor-cars and parts from the United States during January last attained a value of £59,539, as compared with only £39,228 in the first month of 1905.

WE illustrate herewith what is known as the adjustable tyre iron, which has recently been put on the market by Messrs. Janney-Steinmetz and Co., of Philadelphia, U.S.A. The tool is intended for lifting and holding up the outer cover to enable the valve of the inner tube and the security bolts to be readily

placed in position when a change of tubes is rendered necessary by puncture or other cause. As the illustration shows, the device comprises a curved piece of angle steel upon which slides a swinging double spring wire hook. The latter can be slid along the angle steel bar and the tool thus adjusted to suit any size of tyre.

MESSRS. MATTHEW WELLS AND CO. send a neat catalogue of their Wellsaline lubricants, in which are included some useful hints as to effective motor lubrication. The various grades of oil are described, their advantages for different purposes being fully explained.

MESSRS. GUTTERIDGE, LIMITED, of Cambridge Circus, W., have a good selection of novelties, and are now undertaking the teaching of driving as well as the repair of accumulators. Prospective motorists and drivers will be interested in this development of their successful business.

ONE of the most artistic trade lists lately received at our office comes from Mr. William Lea, of Liverpool, and sets forth the merits of the Darracq cars. A well-written technical description is followed by a capital series of illustrations and a list of the records standing to the credit of this type of car.

"NOTES ON IGNITION" is the title of a booklet brought out by the Electric Ignition Company, Limited. This has been written in answer to the large number of requests daily received for information on ignition matters. It has been produced in a form which we think will appeal both to experts and to the novice. The wiring diagrams embody the previous booklet on wiring.

PORTABLE ACCUMULATORS, LIMITED, have introduced a scheme to supply owners of private motor-bicycles and motor-cars with freshly-charged ignition batteries on hire at an inclusive annual fee. The company undertakes to exchange used batteries for freshly-charged ones as often as desired, provided they are returned to the charging stations at 210, Shaftesbury Avenue, W.C., or Much Park Street, Coventry.

A VERY large number of forgeries in Pognon plugs have been discovered by Messrs. H. M. Hobson, Limited, in France. To protect the trade and the public M. Pognon has now added the name of "Hobson," Messrs. H. M. Hobson, Limited, being his sole concessionaires, to that of "Pognon" on the top porcelains, and is arranging to supply all the plugs boxed neatly, with a label fastened across bearing a facsimile of his signature.

MESSRS. ALFRED DUNHILL, LIMITED, who, in addition to their showrooms in the Euston Road, N.W., have premises in Manchester and Edinburgh, have brought out a new lamp catalogue of more than usual interest. In addition to the particulars of their Duplex lens headlights, acetylene generators, etc., information is also given with regard to the supply of dissolved acetylene, the sole rights in which for Great Britain have been acquired by Messrs. Alfred Dunhill. The page of instructions to users of these headlights will be found extremely practical and useful.

THE ambulance exhibited on Messrs. McNeil, Hutchison and Co.'s stand at the Manchester Motor Show was one of the patent accident ambulances made by Messrs. Wilson and Stockall, of Bury.

AT the Dorking garage, owned by Mr. C. J. Tracy, there is accommodation for about twenty-five cars. The premises are open day and night, and are situated adjoining the local post office, on the main road to Eastbourne, Brighton, and other southern resorts.

MR. T. S. BAILEY has acquired the factory and adjoining residence known as Forton House, near the junction of the Lichfield and Wolverhampton main roads at Stafford. He intends to organise a motor-car garage, and develop the residence as a private hotel.

MESSRS. PADDON AND SOPWITH have started in business as motor-car and accessory dealers at 1, Albemarle Street, Piccadilly, W. A special point will be made of tuning up cars, teaching driving, hiring vehicles, and generally assisting prospective as well as actual motorists.

THE Rolledge "Auto" polish is a preparation brought out by Messrs. E. Brown and Son, of Garrick Street, Covent Garden, W.C. This is an admirable preparation for polishing, cleaning, preserving, and waterproofing motor leather and enamelled parts. It is made in all colours.

MOTORISTS who have been fined by the Kingston-on-Thames bench for alleged violation of the Motor Car Act, upon the unsupported testimony of Superintendent Marks, will oblige by sending their names and addresses, with details of their case, to the Secretary, Automobile Association, 18, Fleet Street, E.C.

MESSRS. HALL AND CAPRIS, who have secured the British agency for the Italian-built Isotta Fraschini cars, have been fortunate enough to obtain the 28-35-h.p. Fraschini polished chassis, which was the centre of admiration at the Paris Salon and at the Turin Exhibition, and are exhibiting the same at the Agricultural Hall.

IT is regrettable that interest in the trials now proceeding under the auspices of the A.C.G.B.I. should have apparently waned, and also that one of the competitors, Messrs. George Polkey, Limited, should have withdrawn their entry, having become dissatisfied on one or two points of the trial. Till the time of withdrawal their paraffin headlight had done remarkably well.

THE accompanying illustrations show respectively a general and sectional view of a new ignition switch, known as the "Simplex," which has recently been put on the market by the Electric Ignition Company, Limited, of Sparkbrook, Birmingham.

As will be seen, the switch is arranged to be coupled up to two accumulators, either of which may be used as desired. From the sectional view it will be noticed that the working parts are of a simple but durable design, reducing the chance of the switch getting out of order to a minimum.

THE reliability of the modern car is very simply but expressively told in a letter from Mr. E. T. Langridge, the chairman of the Motor Union, in which he states that his 9-11-h.p. Talbot, delivered in May, 1903, has just completed 22,569 miles. Mr. Langridge adds that he has never failed to drive the car home any day in all weathers under its own power, and that it has proved a most satisfactory and economical car to run.

# The Cordingley Show.

TO-DAY (Saturday), Cordingley's eleventh Motor-Car Exhibition opens at the Agricultural Hall, London, N., and will continue to attract visitors—both present and prospective motorists—throughout the coming week. From what we have ascertained the success of the event is assured, and those who contemplate the motor movement with any interest will find plenty to inspect at the Exhibition, not only in the latest types of cars but in many little things that constitute the enjoyment of "the Happy Motorist," to quote a phrase lately introduced into the world of books. Every day will bring its own special attractions and gatherings, and the proceedings from now to the 31st inst. will make up a really important motor week.

In our succeeding issues we shall report fully on all the stands in the Exhibition; meanwhile the following notes may be accepted as the first part of our record of this event.

## The Carter Steam Wagon.

A newcomer in the steam wagon section of the Show is CARTER'S STEAM WAGON COMPANY, of Oakenrod, Rochdale, who are showing a 5-ton vehicle comprising a number of special features. The boiler is of the vertical fire tube type, constructed for a working pressure of 200 to 250 lbs. per sq. in. The tubes are of curved pattern, an arrangement which allows free expansion and contraction of the tube without straining the expanded ends in the tube plates, consequently reducing the liability of leaky tubes. The furnace crown and upper tube plates are conical in form—in fact, there are no flat surfaces in the boiler. The outer shell of the boiler can be easily removed to allow the interior to be cleaned, and by simply removing the smoke box cover the tubes may be swept clear of soot. Three mud doors and three wash-out plugs are also provided. The boiler is centrally fired, and a super-heating coil is fitted in the smoke box, ensuring perfectly dry superheated steam being supplied to the engine. The boiler

Fig. 1.—The Carter Steam Tip Wagon.

feed is either by means of force pump geared direct to the crankshaft or by an independent steam pump. A special, by-pass valve is fitted to allow the amount of feed to be regulated, the surplus being returned to the tank. A special type of Gresham injector is provided as a standby. Contrary to the usual practice, the engine, which is of 35-h.p., is of compound inverted vertical type, fitted with link motion reversing gear, the vertical type having been adopted owing to the ease with which it can be inspected when running, either loaded or empty. It is enclosed in a box casting, which is securely bolted to cast steel channels fixed to the main frame. The cylinders are cast in one piece, the dimensions being 4 in. and 7 in. diameter by 5 in. stroke. An arrangement consisting of two double-ported brass connections fitted with balanced piston valves is supplied for admitting boiler steam direct to both cylinders.

The transmission is first by means of an improved gear, consisting of a three-speed pinion on the squared end of the crankshaft, this pinion being constantly in gear with three spur wheels on the second motion shaft. Any one of these wheels can be alternately locked to the shaft by means of a clutch arrangement, worked from the driver's platform, giving speeds of 1½, 3, and 6 miles per hour respectively. From the second motion shaft the drive is by a pair of reducing spur wheels to the countershaft, and thence by means of a Renold 2½ in. pitch roller chain to the rear live axle. The gear wheels are all secured by means of forged collars on the shafts, which are machined to form jaw clutches; the bosses of the wheels are correspondingly formed and are retained in position by means of fine threaded locknuts or bolts, a method which obviates all keying of wheels. The whole of the gearing is enclosed in dust proof covers and runs in oil. The road wheels may be of either the artillery, steel, or composite type. The drivers are 3 ft. 6 in. in diameter and 10 in. wide; the front wheels 3 ft. diameter and 6 in. wide. A novel feature of the vehicle is the method by which the rear side

driving road wheel is secured to the end of the live axle. The collar of the latter is notched out in jaw-clutch pattern, the link of the driving wheel being formed in a similar way. The road wheel is forced on to the axle, so that the jaws interlock in an exact fit, the whole being secured by a fine-threaded nut, which is prevented from working loose by a strong taper pin. The off-side driving road wheel is driven by the differential sleeve, to which it is securely bolted. The frame is built of strong channel steel, well braced with cross channels. The object of the Carter Company has been to produce a

Fig. 2.—Plan of Chassis of Carter Steam Wagon.

quiet running vehicle, and with this object they make the springs from Sheffield blister spring steel, they being designed to absorb the whole of the vibration and shocks due to rough roads, so that no strain is transmitted to the frame and gearing. Considering the sheet iron front usually fixed round the platform of steam wagons to be a great intensifier of noise, they have discarded this material in favour of a pitch pine boarded front. A layer of sound-proof material is also interposed between parts liable to create noise. Two powerful brakes are fitted, one foot brake and one hand screw brake, both acting on a brake drum on the rear axle.

## The "Gorton" Steam Wagon.

Considerable interest will be evinced in the steam wagon of Messrs. Beyer, Peacock, Ltd., Manchester, the vehicle being the result of considerable experiment and also of the company's long experience in the construction of locomotives. The vehicle (Fig. 3) is designed to carry a load of five tons, and has a platform area of 86 square feet, the main frame being constituted of 6 in. by 3 in. channel steel girders mounted on stout laminated springs. The footplate is riveted to the steel channel frame, and carries the boiler in a well in the centre, a large fuel bunker being located behind the driver's seat. The water tank, of 200 gallons capacity, is carried between the framework at the rear, so that its weight is useful for adhesive purposes when the vehicle is running light. The boiler (Fig. 4) which has been designed by Mr. H. A. Hoy, is of the vertical type, but resembles the locomotive pattern inasmuch as the fire tubes are entirely submerged, although slightly inclined to the horizontal. A locomotive type of smoke box is fitted which can be quickly opened for cleaning or even for plugging a tube on the road. The fire-box

Fig. 3.—Plan of Chassis of "Gorton" Steam Wagon.

possesses two advantages in combination which are peculiar to this boiler, namely, that the whole of the firegrate can be inspected, through the firing hole situated on the top of the boiler, by the driver from his seat, thus ensuring a well-trimmed even fire, while the whole of the tube ends in the fire-box can be seen through the firing hole, enabling any leak to be instantly discovered. The boiler possesses ample steam space, and the heating surface measures 95 sq. feet and the grate surface nearly 3½ sq. feet. The engine is of the enclosed simple type with two cylinders 3½ in. diameter

by 5 in. stroke; with steam at 200 lbs. pressure per square inch it develops 40-h.p. at a speed of 430 revolutions per minute. The engine is completely independent of the lorry, and attached by only three bolts, so that it can not only be quickly detached, if necessary, but the three-point attachment frees it from any risk of cross binding due to the movement of the main frame. The valve motion is of the single eccentric type, with constant lead and variable cut-off. The reversing shaft is above the cranks, and the valves are placed on top of the cylinders. Further, to save the engine and gear from undue stress, the crank shaft is coupled up to the change-speed shaft (two speeds being provided) by a flexible loose driving disc coupling. A cone having its base secured to the casing of the differential and its apex close to the left-hand bearing gives the differential shaft exceptional stiffness. The final drive is by Brampton 2 in. pitch roller chain working on a

Fig. 4.—Section of Boiler of "Gorton" Steam Wagon.

special form of "automatic pitch" chain wheel. The road wheels have cast steel elastic centres and wood-cushioned rims. The differential shaft is provided with an emergency clutch for locking the gear should the vehicle be running upon slippery or soft roads. The front wheels are 2 ft. 9 in. in diameter, with 7 in. tyres, and the driving wheels 3 ft. 3 in. by 9 in. wide. The steering gear is another special feature of the Gorton wagon; it has been devised by Mr. Hoy, and is designed so that all stresses, both from steering and road shocks, are taken by the axle itself, and not transmitted, as is usual, through the springs to the frame and the steering-wheel. The controlling end of the steering-rod runs into the long sleeve boss of a bevel-wheel which is screwed to receive it, the bevel-wheel being carried in a bracket fastened direct to the H section axle itself. The bevel pinion with which it meshes has a vertical axis and a long telescopic clutch connection, so as to admit of a free sliding action, thus preventing the transmission of the effects of rough roads and deflection of springs to the hand of the driver. The bearing springs of this axle are relieved of the thrust of driving by a stiff horizontal radius rod fastened to the axle and centred on the main frame.

#### The Leyland Steam Wagon.

In addition to a new motor-omnibus, to which we hope to refer in a subsequent issue, the LANCASHIRE STEAM MOTOR COMPANY, LIMITED, are exhibiting one of their class H steam tipping wagons, this being one of a repeat order for ten vehicles they have in hand for the Borough Council of Chelsea. The vehicle, of which an illustration is given in Fig. 5 is designed to carry a load of five tons and two tons on a trailer on good roads and on grades not exceeding 1 in 8. The boiler is of the fire-tube central-feed type, built for a safe working pressure of 200 lbs. per square inch. The distinguishing feature of the boiler, which is adapted to burn coke or hard Welsh coal, is the ease with which it can be taken to pieces for examination and cleaning purposes. The water is fed by a ram pump, which runs at practically a constant rate irrespective of the speed of the vehicle. For the auxiliary feed supply an improved automatic injector with independent suction

is used. The engine change-speed gear and differential are contained in a dust-proof and oil-tight casing. The engine, which is 35-h.p., is fitted with an improved constant lead valve gear. The lubrication of the parts inside the casing is carried out in a simple manner. The casing is charged with oil, the amount being fixed by the opening of a test cock on the side. The cylinders are lubricated by a positive sight-feed lubricator, a duplicate system of feed being fitted to provide for any of the glasses breaking. The differential gear is so designed that it can be locked as occasion may demand, as, for example, on a soft road. Heavy roller chains connect the differential shaft with the rear road wheels. Powerful internal-expanding brakes working on the inside of the chain wheels are provided, these being capable of holding the vehicle on any gradient in either direction. The road wheels are of a special "composite" pattern which are claimed to possess all the advantages of the gun-carriage type whilst dispensing with loose hubs and spokes. The driving wheels are 3 ft. 6 in. diameter by 10 in. wide, and the steering wheels 3 ft. diameter by 6 in. wide. The water tank has sufficient capacity to run the wagon from twelve to twenty miles, according to the nature of the roads. The body, which has a capacity of seven cubic yards, is entirely independent of the working parts and main frame of the wagon, and can therefore be easily removed, and a tank or sheet-watering body fitted in its place. The tipping gear, which is driven off the engine, is self-sustaining in all positions, enabling the wagon to be moved to clear the load.

#### The Foden Steam Car.

MESSRS. FODENS, LIMITED, are present with three of their standard heavy steam vehicles, intended for general hauling purposes for loads up to 5 tons, one (Fig. 6) being intended for Messrs. Mark Mayhew, Limited third repeat order, the second for Messrs. Style and Winch, Limited, Medway Brewery, Maidstone, making the fourth ordered by this firm, and the third a second vehicle for the Idris Mineral Water Company, Limited. In general appearance the Foden wagons, which are being built to comply with the Local Government Board regulations, take the form of a small traction engine, behind which is mounted a platform upon which the load is carried. The boiler, which is of the horizontal multitubular type, forms the front part of the framework. The sides of the frame are constructed of channel steel tied and braced together in such a manner as to secure great strength in the complete lorry. The boiler can be fired with coke, coal, or wood. The wagon is driven by a compound steam-engine fixed on the top of the boiler. The cylinders are fitted with high-pressure gear, by means of which both can, in case

Fig. 5.—The Leyland Steam Municipal Wagon.

of emergency, receive live steam from the boiler, and each cylinder exhaust independently into the chimney. The reversing motion is of the ordinary link type. The power is transmitted by spur wheels to the compensating gear shaft, and thence to the rear axle by an extra strong roller chain. The gearing is arranged for two speeds. The firm are fully employed with orders, many of which, like the wagons exhibited, are repeats, an eloquent testimony to the efficiency of these vehicles.

#### The "Reyrol" Light Car.

Motorists on the look-out for a light two-seated car will be interested in the various examples of the Reyrol exhibited by the MOTOR SUPPLY COMPANY, LIMITED, and of which a general view is given in Fig. 7.

The little vehicle is a reproduction in miniature of the standard design of touring car; the frame, which is of armoured wood construction, carries in the fore part a Buchet single-cylinder engine, having a mechanically-actuated inlet valve. Ignition is by means of accumulator and high-speed trembler coil, but magneto ignition can be fitted when desired without any alteration, provision being made for this. The mixture is furnished by a carburettor of the Vaux type. The water circulation is on the thermo-siphon system through a double row of gilled tube radiators. The clutch is of the leather-faced cone type. The gear-box gives two forward speeds and a reverse; the gear wheels are always in mesh, the changes being effected by means of a sliding key-

#### Coachwork.

Messrs. SAYERS AND COMPANY make a good appearance with some exhibits from their new factory at Vauxhall. Special attention may be directed to the side entrance limousine landaulet body shown in an unfinished state. Although the body is a large one its weight is minimised by the use of aluminium—a metal which, so far, has been very little employed in the building of landaulets. Messrs. Sayers and Company have, however, overcome the difficulties in the way of such work. The interior of this body is a very large one, leaving comfortable seating for three persons at the back, and also for a roomy spare seat, so much better than the narrow flap folding seats, which are often little

Fig. 6.—The Foden Steam Wagon. (See page 72.)

Fig. 6.—The "Gorton" Steam Wagon. (See page 71.)

way which locks the desired spur wheel in position. The final drive is by means of a cardan shaft and bevel gear on to the live axle. A pedal-operated hand brake is fitted to the shaft immediately behind the gear-box, and hand brakes on each rear wheel are controlled by a side lever. The car has a wheel base 5 ft. 6 in. and a track of 3 ft. 5 in. In view of its relatively low price the Reyrol car should meet with a good reception at the hands of those about to embark on a motoring career. A useful little delivery van built on the same chassis is also shown by the Motor Supply Company. It is intended for the use of tradesmen and is designed to carry from 4 to 5 cwt. in addition to two persons.

better than a folding shelf, on which a journey of more than a few miles is very often more a pain than a pleasure. Several important novelties in the design of hoods are also on view, and the firm is to be congratulated on the way in which it makes its debut at an automobile exhibition.

#### Non-Skids.

The "De Fornier" detachable tyre protector is shown by Mr. W. J. MAYER. This is claimed to be a simple, economical and effective device against one of the perplexities of motoring. Its ready method of attachment and detachment is one of its great recommendations.

On each side of the protector is a complete circle composed of thin metal sectors brought together by screw bolts. By this arrangement the whole band can be tightened or slackened (if required) without deflating the tyre. The device protects the whole of the rubber and preserves the resilience and suppleness of the tyre. It is provided with extra strong non-slipping studs fitted with washers which add to the longevity and secure three advantages not to be lightly esteemed. They prevent the rivets from coming in contact with the rubber through the weight of the car, reduce the side strain on the studs in taking corners, and prevent any heat that might generate from deteriorating the leather. The studs are hand riveted, and chrome leather of an excellent quality is employed in the manufacture of the band. The "De Fornier" protector can be utilized on old covers, for the whole device is adjustable at will, providing one of the most effective non-skids now on the market.

#### The Conveyance of Petrol.

Amongst exhibitors in the Gallery will be found the STEEL BARREL COMPANY, LIMITED, whose electrically welded steel barrels and drums have been appreciated in many industries. Their exhibit comprises a variety of welded articles for the storage and transport of motor spirit, petroleum, and other inflammable liquids, oils, etc. For the storage of motor spirit, petroleum, etc., there are a number of steel tanks of different shapes, square tanks of various dimensions, cylindrical tank, and a boat shaped tank, the latter being made to fit into the stern of a motor-boat for containing the necessary motor spirit. Steel barrels such as are used by the various petroleum companies for the distribution of motor spirit and petroleum is another excellent feature. There is a storage cask with a pump specially designed for country houses where lighting is done by means of paraffin oil. A prominent exhibit is a welded steel cart tank for the transport of petroleum, of a capacity of about 600 gallons, having three compartments, the division plates between the compartments being welded in such a manner as to be absolutely and permanently petroleum tight, and so strong as to resist, without the slightest fear of damage, the vibration due to the transport over rough roads. This tank is exceedingly light, being only about two mm. thick. The fact that it is welded is a great advance, securing that it is absolutely tight. Its lightness relieves the strain upon the horses used to draw the cart. For neatness, good finish and efficiency the exhibits of the Steel Barrel Company, Limited, are conspicuous.

#### Solid Tyres.

At the stand of the NEW MOTOR AND GENERAL RUBBER COMPANY, LIMITED, a novelty will be seen in the "Milo" sectional solid tyre for heavy motor traction 'buses, etc. In this tyre each section is securely bolted to the rim and felloe, preventing the likelihood of "creeping." Any damaged portion may be replaced by the driver in two or three minutes, while a further advantage is that it will fit any shape rim. There is an economy of at least one-third of the rubber available for cushioning and wearing surfaces. Any portion of the tyre can be renewed and fitted in a few minutes by an ordinary driver without the use of special tools.

Fig 8.—The Reyrol Two-Seated Car. (See page 72.)

#### Office Requisites.

Office requirements are filled by the BLICKENSDECKER COMPANY, LIMITED, so far as typewriters are concerned, their specialities ensuring visible writing, interchangeable type and permanent alignment. The SHANNON, LIMITED, has also a good display of their labour-saving devices, including roll top desks, sectional cabinets, book cases, etc. This company make a special feature of electric light installation, the folding lamp shown on their stand being a really notable acquisition to any motor office or showroom. On other stands will be found the Oliver and the Underwood typewriters, each with distinct merits entitling it to the consideration of those with heavy correspondence.

Among the specialities of the ANGLO BOPHORUS OIL COMPANY, LIMITED, is an oil intended for use with leather to metal clutches. This is claimed to keep the leather in perfect condition, preventing it from getting hard and dry, or from slipping when the clutch is right home. The company's lubricants for automobiles have been selected after practical exhaustive tests with several makes of internal com-

bustion engines, and include air and water cooled motor oils, motor-car gear-box oil, yellow gear grease, and other preparations of a good grade of quality.

The "Fastnut". Washer is shown by the FASTNUT, LIMITED. Its merits have been previously set forth in our columns. Suffice it now to say that it saves drilling bolts and the usual filing and fitting of nuts, effecting an economy in the cost of construction, and securing such efficiency that insurance companies are making reductions in premiums for third party risks to all owners of cars in which Fastnut washers are used throughout their cars.

Messrs. SMITH, PARFREY AND CO., LIMITED, have a capital exhibition of their axles for both heavy and light motor-vehicles, springs, forgings, gears, and frames for all types of automobiles. We illustrate a group of their wheels—always a chief product of their works. The

Fig. 9.—Messrs. Smith, Parfrey and Co.'s Wheels.

exhibits may be regarded as a fair sample of their ordinary work, almost everything shown on their stand is there by the indulgence of customers and will be delivered as soon as the Exhibition closes. Messrs. Smith, Parfrey, and Co., Limited, also bend timber for all classes of work, such as motor-omnibus wings, car wings, panels, pillars, etc., these being also supplied in aluminium or blue steel. The firm have been manufacturers of wheels since 1836, and are sufficiently up-to-date to recognise the demand for motor-buses, for which they are producing some notable work.

GAULOIS TYRES, LIMITED, are exhibiting in a very comprehensive manner all types, sizes and strengths of the Gaulois tyres. A special feature is made of the Gaulois Special Tourist tyres, which are being used extensively on the Continent for high-powered touring cars. Messrs. Bergougnan and Co., the makers of these tyres, whose works are in Clermont-Ferrand, France, hold a very high reputation on the Continent as pneumatic tyre manufacturers, and possess very extensive works. They cater for all the purposes to which a pneumatic tyre can be used, from the motor-cycle to the heaviest touring car. Besides pneumatic motor tyres, Messrs. Bergougnan and Co. also manufacture solid rubber tyres for motor-omnibuses and heavy commercial vehicles. Other unique features in motor tyres will also be found at this stand.

THE LONDON AUTOCAR COMPANY, LIMITED, have a complete show of accessories and parts as well as of some useful devices of value to motorists. Practical men are familiar enough with the difficulties arising from the carburettor tube becoming choked through foreign matter finding its way into the tank. With a view to obviating this, the L.A.C. petrol filler has been designed to overcome the trouble. The petrol passes through three gauzes of different mesh before entering the carburettor. The filler is easily fitted. The company also show a simple and effective device for registering the compression of the engine by merely removing the sparking plug and replacing this with the gauze. This will prove a great saving of time and trouble in tracing the puzzling losses of power which sometimes worry motorists. The L.A.C. spring fork attachment is a reliable means of eliminating the excessive vibration transmitted by the front wheels of motor-cycles to the rider's hands and body. It is possible to fit the attachment to almost any make of machine, while the absence of any lateral movement in the wheel ensures the rider against the risk of side slips. The L.A.C. patent terminal is another novelty at the stand, the display being completed by larger exhibits, including castings for all purposes, three or four different types of engines, steering gears, carburettors, coils, accumulators, etc.

Messrs. A. F. HARDING AND CO., LIMITED, have a show of particular interest to the trade as well as private motorists, anxious to maintain a good appearance on their vehicles. The specialities of the firm are known by the "Fish and the Ring" brand, and consist of leather varnishes and dyes in all colours, their card of specimens being a distinctly attractive sheet for reference. The "Blackall" varnish is a good preparation for touching up ironwork and woodwork of motor-cars, producing a brilliant and lasting polish and drying hard in a very short time.

(To be continued.)

THE old Penrhos Foundry at Llanelli is being remodelled and fitted with machinery for the manufacture of the Davies spare wheel.

## CORRESPONDENCE

Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, W.C.]

### THE INTIMIDATION OF MOTORISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I forward herewith a copy of a letter which the Society of Motor Manufacturers and Traders have sent to the various associations that have arranged to hold meetings at the Agricultural Hall during the progress of the Motor Car Exhibition there.

For some considerable time past the members of the society have attempted to undermine the strength of my exhibition generally, and to persuade firms in the motor industry not to show. With what ill success this has been done will be apparent when the exhibition opens on the 24th inst., and knowing how thoroughly representative will be the character of the display, I have not replied to those who have been prominent in their attacks, being content to give the motoring public demonstration of the position attained by Cordingley's Exhibition, the eleventh of the series.

But the writing of the letter referred to; with its menacing demand, warrants me in addressing you and your readers on the dictatorial atti-

It is significant of the attention paid to this "official" ultimatum that the programme of conferences, meetings and receptions will be held as though the letter from the Society of Motor Manufacturers and Traders had never been penned. Only the British Motor Boat Club has been subservient enough to withdraw from its engagement, but in its place a more interesting meeting for those concerned with motor-boats has been arranged, so that the continued ill-will of the society has again blown awry, surely much to the advantage of the motor movement.—Yours truly,

CHARLES CORDINGLEY.

Copy of letter sent from the Society of Motor Manufacturers and Traders.

Dear Sir,—My committee have learnt with regret that your — proposals to be officially represented at the forthcoming motor show at the Agricultural Hall, which show is not officially recognised by the majority of the trade, but rather the contrary.

At the official motor exhibition at Olympia every opportunity will be given you to be properly represented, and I am directed to convey to you the strong expression of opinion of my committee that no organisation in the position in relation to the industry of your own ought to officially connect itself with any exhibition not officially recognised by the majority of the trade.

I am therefore directed to request you, if you desire, the support of this society, to furnish an assurance that you will not so support any such other exhibition.—Yours faithfully,

T. F. WOODFINE.

The Tyre Trials.—The Competitors near Daventry.

[Argent Archer.

tude assumed by the society, especially as the number of individual firms exhibiting at the Agricultural Hall will exceed that at the so-called "official" show.

For some years past motor organisations have had the hospitality of the Agricultural Hall Exhibition, and have grown stronger in membership and influence, perhaps, because of the opportunity thus afforded of reaching motorists and attracting the notice of the Press. Many recognise the exhibition as a factor in their progress; others who have their annual meetings in March realise that when their members are in town for the show it is to their mutual advantage to meet at the Hall. Now, perforce, at the dictation of a trade society, annual meetings are to be set aside, events which have been a feature of the year are to be abandoned, long arranged conferences to be postponed, and the machinery of automobile associations disturbed unless committees "furnish an assurance" not to carry out the wishes of their members.

The opposition of the society has now passed beyond the region of trade matters; it has developed towards the whole motor movement, being a deliberate attempt to coerce those associations responsible for the guidance of motor policy, the organisations concerned with the sport and pastime, and of those interested in developing the utilitarian object of the movement. Such restriction of effort is not only unfair and impolitic, but it sets a barrier around freedom of action and is entirely subversive of all British notions of public life. Why, then, should this effort be made to stifle discussion, thwart the development of automobilism, and dictate terms upon which associations like the Motor Union, with its 11,000 members, shall carry on their propaganda? Surely the time has come to break silence and to call upon all interested in the future of automobilism to demand free interchange of ideas and the liberty of action without which progress is impossible.

### DOES LOW TENSION MAGNETO IGNITION GIVE GREATER POWER THAN HIGH TENSION?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have seen a good many statements to the effect that a petrol motor is capable of developing greater power with low tension or magneto make and break ignition than with high tension with accumulators and coil. I should be glad to know whether the truth of the statement is borne out by actual practice.—Yours truly,

WORTHING.

### THREE-CYLINDER ENGINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. Mawdsley Brooke's letter in your issue of the 24th February.

If Mr. Brooke disagrees with my contentions, then I am prepared to prove same with a three-cylinder "National" car having a bore 4½ in. by stroke 5½ in. against a four-cylinder car of equal cylinder capacity, and to be under other similar conditions. I make this assertion, that the three-cylinder car will run as smoothly, as fast, as flexibly (perhaps slower on "top") as most four-cylinder cars, without the extra complications, and the smooth and flexible running is what the public demand. Many well-known motorists have been deceived, and not until the bonnet has been raised would they believe it was only the simple and much belied three-cylinder engine.

I am glad that your correspondent Mr. Gaskell is a supporter of the three-cylinder engine. If users would only put on record their opinions, it would assist in removing the ridiculous prejudices. Mr. Gaskell asserts that his three-cylinder "runs as well as any four,

and better than most," which is exactly what we maintain. It is possible to construct a three-cylinder engine car that will fulfil all the requirements that a four is likely to be subjected to by any critical buyer.—Yours truly,

P. R. LAMB.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with much interest the letters upon three-cylinder engines, and am rather surprised at the opinions of Mr. Mawdsley Brooke and of R. H. Maudslay as regards the vibration set up in these

The car shown in the above illustration is a 16-20-h.p. Argyll which was dispatched last week from Alexandria, E.B., to Ceylon, it having been built to the order of a leading resident in the island. The capacious hood, which will protect the occupants against the fiercest rays of the tropical sun, has a celluloid panel at the back and a glass screen in front, and can be readily detached.

engines by the "impulses always turning from one end of the engine to the other." I do not question the experience of these gentlemen in the least, but does their experience not lie entirely with vertical engines? Have they ever noticed this "pendulum" motion with any good horizontal engines, such as the Duryea, for instance? I cannot see how any "tilting" motion can take place with these, and must say that I have never seen any. I would like to have this threshed out, as I have a great liking for three-cylinder engines, for various obvious reasons.—Yours truly,

INTERESTED.

#### ASSISTING WOULD-BE MOTORISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Theory has sometimes to yield to practical experience, and it is, therefore, to those who are using motor-cars day in and day out that would-be motorists must look for practical information with regard to motor-cars. A record of the facts and things met with would be very interesting and very helpful to novices if only motorists would take the trouble to make the same public.

It is on the broad plane of imparting useful knowledge that I venture to suggest that owners of motor-cars should write frequently to the *M.C.J.* about the practical points that come up in their several experiences. Some of the things that beginners desire to know about are: (1) The consumption of fuel. (2) The cost of repairs; the kind of repairs most common and the methods taken to carry out the work and prevent recurrence of the trouble. (3) The life of tyres under varying conditions. (4) Useful accessories; that is, all those adjuncts to the car in the shape of lamps, tools, and the like, which are not an actual part of the vehicle. (5) Experiences with various forms of motors, gearing, lubricators, carburettors, ignition, pumps, etc. (6) General happenings in operation, breakdowns, their causes, results, and repair.—Yours truly,

W. HENDERSON.

#### DRIVING CERTIFICATES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very pleased to see a letter in the *M.C.J.*, signed "F. C. M.", re driving certificates. I quite agree with him that the Board of Trade would be a more suitable authority than the A.C.G.B.I. to hold driving examinations; I would also strongly protest against the heavy entrance fees charged by the Club. Now that driving schools are so plentiful, motor drivers are not so difficult to obtain as they were a few years ago; consequently, their wages have gone down considerably, and for a man to enter for both driving and mechanical proficiency certificates would mean a big slice of his week's wages gone with not much to show for it.

Of course, no reasonable minded man will deny the desirability of some system whereby the incompetent drivers can be weeded out, and the club deserve all praise for taking the stand they have done, seeing

that the Board of Trade have so far neglected their responsibility in the matter. But I think, if the Club were as anxious as they profess to be to get drivers to qualify for their certificates, they should be content to accept a less entrance fee than what they are demanding.

I have no doubt "F. C. M." will join me in the hope that other drivers will give their views on this matter.—Yours truly,

B. 1048.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Might I, through your valuable paper, endorse "F. C. M.'s" remarks re the above in the *M.C.J.* of the 10th inst.? It is, as he points out, a very unfair tax on drivers. Then look at the charge the Automobile Club are making for their certificates; nine men out of every ten (even if they want to go in for the Club's certificate) positively cannot afford to do so. If a man has to go, say, twenty miles to be examined, it means that a driving certificate will cost him 30s. at least, which is a serious item to a driver who is, perhaps, not getting that amount per week in wages. Then, again, the Club are (so I understand) borrowing cars for the examinations, and charging the poor driver 10s. for the use of the cars. In my opinion it is simply waste of time and money, going in for the examinations, as I firmly believe that when the time comes that it is necessary to have a certificate the A.C.G.B.I. will not be the examiners, and the certificate granted will be something to be proud of, and not waste paper, as at present.—Yours truly,

PANHARD.

#### OVERHEATING TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a small double-cylinder car with which I have two slight troubles. The first is the water circulation, which, after running well perhaps for days, will stop, and the engine overheat. I then have to wait ten minutes or so on the road to cool down, when, without anything having been touched, the pump starts work and I have no more trouble for perhaps two or three journeys. The pump is gear-driven, and is composed of two cog-wheels in mesh. My second trouble is caused by occasional alarming explosions in the exhaust box, when I switch engine on and off at corners, etc. I should feel obliged if any of your readers could suggest a remedy for both or either of these troubles.—Yours truly,

J. BARTON.

#### ETHERISED VAPOUR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can you kindly inform me whether any data exist as to the amount of ether required mixed with petrol to increase the explosive force of the mixture, whether it is safe to use, and if the extra heat engendered is considerable? The exact sp. gr. at various temperatures would be useful as a guide. I have thought of adding an extra air inlet and bringing the ether through it.

A White Steam Delivery Van, built for Messrs. Liberty and Co. (See page 62.)

Also has anyone tried CO<sub>2</sub> in bulbs for speedy tyre inflation. Were they not used in the Gordon Bennett races?—Yours truly,

GO AHEAD.

[A reference to the first point raised by "Go Ahead" will be found under "Some Current Topics." As regards tyre inflation, it is quite usual in France to carry compressed gas cylinders for blowing up tyres; CO<sub>2</sub> is as good as anything. Except for racing, however, an engine pump would be lighter and better, and it is somewhat surprising that they are not more often employed. A pressure regulator would be advisable, similar to those used with magic lan-

terns, but adjusted to cut down to 90 lbs. instead of the much lower pressure there employed, if a gas cylinder is used.]

### KNOCKING IN THE ENGINE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to "Devonian's" letter in the last issue of the *M.C.J.*, the trouble your correspondent experiences is no doubt caused through the flywheel of the engine being loose on the crank shaft. If he will take down and re-key the same, he will find the knocking disappear.—Yours truly,

WILTSHIREMAN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The pounding complained of by "Devonian" in the last issue of the *M.C.J.* is caused by faulty carburation. Your correspondent should see that none of the air inlets have become choked, clean out the float chamber and the jet. If the knocking then continues, an extra air inlet, controlled by hand, might be tried. This should be manipulated when the pounding commences.—Yours truly,

O. H. B.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "Devonian's" query in the last issue of the *M.C.J.*, re "Knocking in Engine," I was troubled with the same complaint with a two-cylinder engine, and found it was due to the flywheel having become slightly loose on the crank shaft axle, the nut behind it having worked loose. After having tightened this the knocking entirely ceased and I had no more trouble. Perhaps "Devonian" may find this to be the cause of his difficulty.—Yours truly,

E. TRAVISS.

### MOTOR-CARS AND FARMERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letter signed F. Heath opens an interesting subject, but I doubt if a service of cars could be made to pay by conveying milk, as it is heavy and bulky stuff and the prices the rail companies now carry it for and return the empty churns are fairly low for most distances. It might answer those farmers who live about ten miles from any big town, but not twenty or over, at present. I think it would pay better for fruit and other perishable garden produce. I believe this is being done by a few big growers, and will be much more in time. Your correspondent might tell his farmer friend that in a little time motors will be of great use to farmers in many ways. I don't think F. H. would find his combined milk and pleasure car quite the thing. Has he ever tried the same thing with a horse? I have, and I found that the horse had to be home at certain times to take the milk to station, whether I wanted to or not.—Yours truly,

W. KILLICK.

### THE SIZE OF CHAIN WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the discussion on Colonel Crompton's paper on "Unsolved Problems in Motor Engineering," Professor Sharp remarked that "chain wheels as now used had an insufficient number of teeth on them." A short time ago I carried out some experiments on the above and found that by fitting an exceptionally large sprocket on the countershaft and a proportionally larger one on the back wheel I got a much smoother drive and hardly any noise worth mentioning, and I contend a chain running on sprockets as above is practically noiseless; of course, providing it is kept in proper condition. I think if the countershaft sprockets and back wheel sprockets were made as near equal as practicable, and any gearing down necessary effected at the differential, the chain driven cars would run even smoother than they do at present. Another point I might mention: when running free there is no clinking of the chains, which one sometimes hears; they run on the sprockets quite as smoothly as when transmitting power.—Yours truly,

WM. L. HARDMAN.

### QUERIES RE WOLESLEY ENGINE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am having a little trouble with my 10-h.p. Wolesley car. It has been running well up to quite recently, and as the engine was losing power a little, I ground all the valves in, and now it is worse than before. If any reader of the *M.C.J.* has had the same trouble, I should be obliged if he would let me know how often the exhaust and inlet valves ought to be replaced. I find one inlet spring to be much weaker than the other, but I do not think that has anything to do with it, as the engine has run well with it before.—Yours truly,

AJAX.

[Undoubtedly "Ajax's" trouble is caused by the tappet-screws under the exhaust valves giving too much lift, so as to hold them slightly off their seatings. By grinding in it would slightly lower the valves, bringing them in contact with the adjusting screws in the end of the

lever which actuates them. The inlet valve springs should both be as near the same tension as possible. With regard to the renewal of valves, this is a point which must be left for discretion, as some engines may burn a valve in a few journeys, while others may run for years.]

### ENGINE AND CARBURETTOR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a 10-12-h.p. car with four-cylinder high speed engine fitted with a Krebs carburettor and throttle, also variable lift induction valves. On starting up the engine and throttling it down the motor runs very well, but on opening the throttle it misses fire for about fifty revolutions or more, then picks up and will race. When running the car on the road with the throttle open and ignition advanced, the motor works by fits and starts, pulling well for about 100 yards, and then slowing down for a few yards, but not missing fire. I have tried altering the carburettor by lowering and raising the jet, with larger and smaller holes, but this has had no effect. Any suggestion will be greatly appreciated by—Yours truly,

CARBURETTOR.

[Our correspondent's trouble seems to be in connection with the suction float of the carburettor, this allowing too much air; a somewhat stronger spring might remedy matters. A choked petrol pipe would also cause similar trouble, also a petrol tank (gravity feed), without a small vent-hole or with the same stopped up.]

### A DE DION QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you please tell me, through the *M.C.J.*, what size of hole there should be in the De Dion carburettor of an 8-h.p. two-cylinder car? My engine is very bad to start when cold, but when I put a little petrol in the cylinder it starts immediately. I think it does not allow enough petrol.—Yours truly,

ALBERT ED. BIRKBY

[The size in the jet depends entirely upon the size of the air inlet, but if the engine runs all right after once started, we very much doubt if

The 24-36-h.p. Fiat Car, fitted with Pradeau Spring Wheels, which are at present undergoing a 4,000 miles test.

the trouble is in this direction. In all probability it is due to the jet being slightly too high. It is a very common occurrence to have to inject petrol before starting the engine when cold, so if the motor runs all right after starting, we would advise our correspondent not to tamper with the carburettor.]

VERS THREE CYLINDER ENGINE.—Mr. P. Lamb, of Messrs. Lamb, Bros. and Garnett, writes:—"We must entirely disagree with the statement of the Standard Motor Co., that it is only necessary to race an engine of three cylinders and watch the steering wheel to realise the excess of vibration over that of a four or six-cylinder car. In our own car, the "National," we witness no vibration worthy of discussion at high speeds. It is rather a rash statement to make that the three-cylinder is bound to become obsolete, as this is contrary to well-known authorities on the subject."

THE COST OF CARS.—We have received a number of letters on this subject which we regret we have not space to publish. Among them is one from Mr. D. M. Weigel, in which he states that he is sceptical "whether Mr. S. F. Edge is able to obtain 48-h.p. from 300 cubical inch contents. I should be pleased to pay all Mr. Edge's expenses if he will have the engine in question, viz., a six-cylinder engine of which the cylinder dimensions are 4 in. by 4 in., tested upon an independent testing machine, and I would suggest that the engine be tested at Faraday House, and that we obtain a certificate as to what the actual horse-power was for half an hour's run."

THE EXPRESS TANK CAP.—The Albany Manufacturing Company, Ltd., of Willesden Junction, N.W., write that the tank cap illustrated in the *M.C.J.* of the 10th inst. was designed and patented by them about a year ago.

HIRING MOTOR-VANS.—We have yet another inquiry from a firm desirous of hiring light motor-vans—not lorries—and shall be glad to hear from those in the trade able to meet their requirements.

## CLUBS AND ASSOCIATIONS.

### ESSEX.

THIS club held its first dinner at the Great Eastern Hotel, Liverpool St., London, on the 10th inst. The chair was taken by Mr. Gurney Fowler, J.P. The toasts given included "The Club and Automobilism," proposed by Mr. T. Clarkson and responded to by the hon. secretary, Mr. G. C. Tijou, who stated that the membership of the club, which had only been formed three months, numbered seventy-one. Dr. Butler Harris then gave "The Visitors." Dr. Ferrier responded. The speeches concluded with the health of "The Chairman," proposed by Mr. Mills and suitably acknowledged.

### AERO.

THE Hon. C. S. Rolls has ordered two balloons through Messrs. Short Bros., the aeronautical engineers. One will be made of cambric, 42,000 cubic feet capacity, to carry four persons; this balloon will be owned jointly by Mr. Rolls and Messrs. J. Moore-Brabazon and Warwick J.

excellent record of a busy year's work the committee place on record their keen appreciation of the services of Mr. A. McAlpin during several years.

### AUTO-CYCLE.

AT the annual general meeting of the Autocycle Club, held at the Automobile Club, Piccadilly, a few evenings ago, Mr. Robert Todd presiding, Mr. Arthur Stanley, M.P., was re-elected president.

The committee was elected as follows:—Individual members:—Messrs. H. M. Wyatt, A. G. Reynolds, H. P. E. Harding, B. Chatterton, W. Gunn, V. Hart, E. W. Goslett, and W. Pratt; representing the Automobile Club—Messrs. E. M. P. Boileau, Leopold Canning, J. Pennell, J. Lyons Sampson, C. A. Smith, and Robert Todd; representing affiliated clubs—Messrs. E. Nelson, Cardiff M.C.; A. E. Newton, Motor Union; E. J. Bass, Essex M.C.; F. J. Ellis, Woolwich, Plumstead and District M.C.; H. B. Renner, Lewisham A.C.; G. W. Blackaller, Cardiff M.C.; G. H. Rogers, Chatham and District M.C.; W. H. Georges, Guildford M.C.; R. A. Osman, Ilford and District M.C.; J. R. Bedford, Birmingham M.C.; E. S. Hare, Bristol M.C.; and the Rev. — Ayton, Coventry M.C.

### HEREFORDSHIRE.

AN open hill-climbing contest will take place on Frome's Hill on Thursday, May 24th, for touring cars not exceeding 35-h.p. This is the hill which beat so many of the cars in the small car trials. It is 1,289 yards long and the steepest gradient is 1 in 6'37. The contest will be held under the A.C.G.B.I. rules and the times

The Meet of the Ladies Automobile Club at "Montreal," Sevenoaks.

Wright, two amateur members of the Aero Club. The other balloon, which is for Mr. Rolls' own use, will be a small one of 17,500 cubic feet, made of Japanese silk for lightness; this latter balloon, which will be the smallest ever seen in this country, will, when packed up, go into the back of an ordinary motor-car, and Mr. Rolls intends to take it about with him on a car, so that he can make an ascent in any part of the country where gas is available.

Both these balloons will be on view at the exhibition of the Aero Club, which will be held in connection with the Motor Car Exhibition at the Agricultural Hall, London, from the 24th to the 31st inst.

### LEICESTERSHIRE.

THE membership of the Leicestershire Automobile Club has now attained 103. A census of the traffic on the road leading from Leicester to Loughborough, at the foot of Birstall Hill, from Friday, October 5th, to Thursday, October 12th, from 7 a.m. to 9 p.m., was taken by the club, with the following results:—Horse vehicles, 2,585; bicycles, 3,646; motor-cycles, 172; motor-cycles with trailers, 54; motor-cars, 244; traction engines, 38; horses, 167; cattle and sheep, 737.

The committee have entered into communication with the County Council with respect to the absence of danger boards, with the result that the Council have commenced erecting the same in accordance with the provisions of the Motor Car Acts. They have also been in communication with the Highway Committee of the County Council with reference to the dangerous bridge and ford at Sharnford, and they co-operated in this matter with the C.T.C. and the N.C.U. In the course of their

will be taken by the official timekeepers of that body. Entries close on Saturday, May 19th, and should be sent to Mr. Wilfred Groom, the hon. secretary of the Herefordshire Automobile Club, Wroxeter, Hereford, together with entry form and £1 ls. entrance fee for each car. Steam cars are barred from the competition.

### MID-STAFFORDSHIRE.

THE annual general meeting of the members of this club was held at Stafford on Saturday under the presidency of the Rev. S. Wickham Jones. The report and balance-sheet showed that there were thirty-two members of the club, which had a credit balance of £5 16s. 1d. During the year the club, which is a year old, was affiliated to the Automobile Club of Great Britain and Ireland and also to the Motor Union. A charge against one of its members of furious driving was successfully taken up and defended, the Bench at Walsall dismissing the case. The chairman said he believed the general public had not yet fully realised the power of the motor and the fact that it was far safer than a horsed vehicle. Motorists showed far more consideration and respect for people they met on the road than formerly, and the more owners there were who drove their own cars the better would be the position of motorists. Mr. H. Irwin (Stone) also spoke.

The Earl of Shrewsbury and Talbot was re-elected president of the club, the Rev. S. Wickham Jones and Mr. W. C. T. Mynors vice-presidents, Mr. C. H. Riley hon. treasurer, and Mr. H. Charrington hon. secretary. A discussion ensued as to the best method of inaugurating the club season, and it was agreed to arrange for a hill-climb on

Saturday, April 28th, and to proceed to Stone subsequently for tea. Two new members, Mr. Selby Gardner, of Rugeley, and Mr. Cyril Marson, of Stafford, were elected.

### LINCOLNSHIRE.

To have fifteen new members elected at one meeting was the pleasurable experience of Mr. Godfrey Lowe, the new hon. secretary of the Lincolnshire A.C. at the committee meeting last week. They included Messrs. T. Wilson, F. A. Peacock, Richard Whitton, Dr. A. W. Allan (Skegness), H. D. B. Aylliffe (Lincoln), Dr. J. S. Chater, Dr. E. Mansell Symptom and Dr. W. Jagger (Lincoln), J. Sutcliffe Pyman (Grimsby), H. Haagenzen (Grimsby), F. W. S. Heywood (Holbeck Manor), Major W. R. Fane (Fulbeck Hall), Dr. H. A. Howes (Horncastle), M. J. Tomlinson (Birtherpe Manor), and J. E. Casswell (Laughton). The rules for the 100 miles non-stop run on May 18th were completed, also the arrangements for the public luncheon at Lincoln on Saturday next, the 31st. The acceptances have exceeded all expectations, practically every chairman of the various County and Rural District Councils and other similar public bodies, as well as the highway surveyors of the county, and the mayors of Lincoln, Grimsby, Louth and Boston having signified their intention of being present. The Hon. A. Stanley, M.P., the chairman of the Motor Union, has promised to attend.

### HALLAMSHIRE MOTOR CYCLE.

At a committee meeting of the Sheffield and Hallamshire Motor Cycle Club, twenty-eight new members have been proposed, which brings the number to eighty-nine. It is expected that there will be one hundred by the opening run, which is to Blythe on April 2nd.

Prizes are being given for the best attendance at both Thursday and Saturday runs. A week-end run has been arranged to Grimsby and Cleethorpes at Easter. Members meet at headquarters on Sunday, April 15th.

### NORTH LONDON

THE North London Automobile Club's handbook for 1906 is a capital production, upon which Mr. C. Smith and his officers are to be congratulated. From the list of fixtures we learn that May 19th has been decided upon as the date for the Gamage cup competition between this and the Southern Motor Club.

Among the members of the North London Club are Sir Thomas Lipton, Col. H. F. Bowles, J.P., the Hon. Rupert Guinness, Sir Walter Johnson, J.P., Messrs. F. Coleman, A. W. Gamage, T. North, W. G. Rice, J.P., F. Thresby, and W. A. Vincent.

### SCOTTISH AUTOMOBILE CLUB.

At a meeting of the general council held in Glasgow on Friday last week, drafts of the minutes of agreements between the Club and the Automobile Club of Great Britain and Ireland and the Motor Union, as these had been negotiated by the sub-committee, were submitted, and these were approved for completion.

A scheme for the establishment of a department of the Club relative to commercial vehicles, and which will include the users and makers of these, was submitted and discussed and remitted again to a special committee to be dealt with.

The admission of twenty-nine members was reported and confirmed.

### MOTOR VAN AND WAGON USERS' ASSOCIATION

THE annual meeting of this Association will be held at the Agricultural Hall, London, on Tuesday next, at 4 p.m. when it will be proposed to amend the rules of the Association so that it shall be described as the "Motor Van, Wagon and Omnibus Users' Association."

The report emphasises the important development that has taken place in connection with the motor-bus, more particularly in London. The Association has dealt with many legal points raised by its members and has considered some of the difficulties in connection with the restrictions on canal and other bridges. The committee is now preparing a scheme for undertaking the expert examination of members' cars. During the year important negotiations have been carried through with the War Office, due reference to which has appeared in the *M.C.J.*

At a meeting of the Blackburn and District Motor Club Mr. A. E. Beard has been giving a practical demonstration on vulcanisation.

MR. H. J. MADDOX has resigned the hon. secretaryship of the Automobile Club of Victoria. Mr. J. Lang has been temporarily appointed in his stead. The address of the club is 243, Collins Street, Melbourne.

THE Natal Automobile Club is in consultation with the local authorities with a view to passing new bye-laws for motor traffic. The secretary is Mr. C. D. Bradford, Field Street Buildings, Durban, who will be pleased to hear from British motor-car makers.

THE second ordinary meeting of the London Section of the Automobile and Cycle Engineers' Institute will be held at the Royal United Service Institution, Whitehall, London, on the 28th inst., when Mr. H. Worby Beaumont will read a paper on "Public Service Motor Transport."

THE opening meet of the South Herts Automobile Club will be held on April 7th at headquarters, the Falcon Hotel, Waltham Cross, at 3 o'clock, to be followed by a run to Stevenage, where tea will be provided at the White Lion.

## SOME UNSOLVED PROBLEMS IN MOTOR ENGINEERING.

(Concluded from Page 56.)

BELOW we print the concluding portion of the discussion on Lt.-Col. Crompton's recent paper on the above subject at the Cycle and Automobile Engineers' Institute.

Mr. P. L. Renouf said that experiments which he had conducted for the improvement of the single-cylinder engine showed that this could be done with very slight modification. He referred to the Hamilton system of control as fitted to motor-bicycles, and said that it had possibilities for cars also.

Professor Archibald Sharp said he thought with Col. Crompton that automobile engineers had not quite realised the important bearing that the character of the road they had to deal with had on the design and construction of the vehicle. Roadmakers should be instructed to consider the method of road repair most suitable for the traffic passing over it. Just to give an idea of what an undulating, uneven road meant, he asked them to take a favourable country road with undulations such as were to be met with everywhere, 2 ft. apart and 1 in. high, and a car running at thirty miles an hour. That meant that every portion of the mass of that car which partook of that slight vertical oscillation was going upwards and downwards 1,320 times a minute. The acceleration given to that mass was the same as that of an engine of 4 in. stroke making 660 revolutions per minute. All engineers had directed their attention to keeping down the weight of the reciprocating parts of the engine, but it was time they were devoting a little more attention to keeping down the mass of the car that must partake of this vertical motion. In the case of a London motor-bus running at a speed of fifteen miles an hour that meant that the forces required to produce these vertical accelerations were reduced considerably; but even at fifteen miles an hour it meant that the upward force to be given to the axle was equal to 6½ times its own weight. Therefore it was easily to be seen what was the great advantage of pneumatic tyres. If they could get a pneumatic tyre that would suitably carry the load of a motor-bus a great deal of trouble arising at present from damaged chassis, frames and springs would be done away with at once. That same consideration had to be taken into account in the question of the kind of drive to be used—live axle as against chain. In a live axle they had a considerably greater mass directly connected to the wheel, and therefore to be jolted up and down, than with chain drive. The chain, on the other hand, was a much lighter form of construction, and no doubt in this respect it was superior to the live axle.

Mr. Crawley thought Col. Crompton was going a little too far in advocating the entire abolition of change-speed gears in motor-buses, and said that personally he thought buses should be built in this respect to suit the routes they were intended to run on. The same gearing would not do for a hilly and a flat route. The dust question was not altogether an unsolved problem, though they were getting very near to its solution so far as the design of cars was concerned, and the road makers were meeting the motor-car makers loyally in the matter. The last three meetings of the Civil Engineers had been given over to the discussion of the question of dustless roads. It was now recognised that motor-cars were coming and they were going to make their roads to stand them. Motor-car designers must also do their best to get rid of dust; and they could do it now with very little expense.

Mr. Cooper, referring to what he called the fashion for spring wheels to absorb vibration, suggested that the remedy was worse than the disease. Spring wheels might do something on heavy vehicles, perhaps, but for ordinary touring vehicles he did not see that they offered any advantage. A large number of people wanted cars to run at not more than twenty miles an hour, and to look after the same themselves. That being so, would it not be possible to do something more in the way of solid tyres than had been done? Solid tyre makers would say there was no difficulty about solid tyres, but the fact remained that makers did not fit them.

Col. Crompton afterwards replied on the points raised in the discussion. He said he thought they must admit that his paper had been a success in one way—that it had led to an interesting discussion. He wished to deprecate any feeling that he was unduly biased as to the respective merits of steam and petrol cars. He used the great simplicity of the steam car in order to show what the petrol car might be brought to. The fact of there being so much greater elasticity in the steam engine than in the petrol motor marked the great difference between the two. When he introduced the subject of the Brayton engine it was to show that with the petrol motor there was the possibility of some improvement in the engine itself, and a hope of getting the same simplicity which was now obtained in the steam engine. Mr. Roebuck had asked why a great man like Mr. Parsons had not been able to arrive at a gas turbine. That was a phase of the continuous temperature question. The continuous pouring of a stream of hot gases upon the rotary portion of the turbine had the effect of enormously raising its temperature, so that the difficulties connected with producing a gas turbine were something so gigantic that it was impossible to realise them. In regard to what Mr. Sturmev said about a central chain drive, it was remarkable that a central chain was most efficient, whereas the unfortunate side chains were the cause of endless trouble. He thought the reason of this was that the side chains lived in a mud bath. Such speakers as Mr. Coventry were of great value to the Institute, and

it was one of the arguments why the Institute should be enlarged so as to get all the designers into it, in order that they might meet the workers and talk over difficulties. He complimented Mr. Crawley and Mr. Cooper upon the time and attention they had devoted to the solution of the dust problem. He did not know how much time and trouble had been spent in attempting to find out what Spyker had embodied in his car, features which designers were only beginning to be dimly aware of. The fact was that a car like that, which did not kick up a dust when it was travelling at thirty miles an hour, was worth five hundred pounds more than a car which could not be driven at the speed without being a trouble and a nuisance to the public. He thought the time would come when people would not buy the cars which were being made now without any attempt to stop the dust. It was very easy for designers to say "It is all the fault of the roads; roads will have to be improved." The trouble appeared to be the other way. Designers had not paid attention to this matter until quite lately. He did not think they had anything to hope for from solid rubber tyres except in very small cross sections. Those at present on motor-omnibuses were far too great in cross section. The centre of the mass of those tyres was always being strained beyond its elastic limit and began to be deteriorated from the very moment it was put on.

### INTERNATIONAL TOURIST TROPHY RACE, 1906.

BELOW is a list of the entrants to date for the Tourist Trophy Race, to be held in the Isle of Man, on Thursday, September 27th.

(1) Mr. John S. Napier, Arrol-Johnston; (2) Mr. A. Rawlinson, Darracq; (3) Mr. A. Rawlinson, Darracq; (4) Hon. C. S. Rolls, Rolls-Royce; (5) Hon. C. S. Rolls, Rolls-Royce; (6) Mr. Warwick J. Wright, Minerva; (7) Mr. D. Citroen, Minerva; (8) Mr. T. B. Browne, James and Browne; (9) Mr. C. Harman Wigan, Vinot et Deguingand; (10) Mr. John S. Napier, Arrol-Johnston; (11) Mr. Alec Govan, Argyll; (12) Mr. Alec Govan, Argyll; (13) Mr. Harry Smith, Rover; (14) Mr. Albert Brown, Brown; (15) Mr. E. H. Lancaster, Clement; (16) Mr. Claude Watney, Pipe; (17) Mr. T. C. Pullinger, Humber; (18) Mr. Edward Powell, Humber; (19) Capt. W. E. D. Owen, Aries; (20) Capt. W. E. D. Owen, Aries; (21) Mr. R. L. Jefferson, Rover; (22) Mr. F. Guy Lewin, Peugeot; (23) Mr. J. Ernest Hutton, Berliet; (24) Mr. J. D. Siddeley, Wolseley; (25) Mr. R. R. Brown, Wolseley; (26) Mr. J. Ernest Hutton, Berliet.

### MOTOR-CAR ACCIDENTS.

In the Westminster Coroner's Court, on Saturday, Mr. Troutbeck held an inquest touching the death of William Shipway, a cabdriver, lately living at North Finchley, who died in Charing Cross Hospital from the effects of injuries received in a collision with a motor-omnibus belonging to the London and District Omnibus Company, on the 7th inst. Robert Smith stated that whilst standing at the corner of Jermyn Street and Regent Street, on the morning of the 7th inst., he saw a motor-omnibus and a cab driven by the deceased coming in opposite directions. Suddenly they collided. George Harris, who also witnessed the accident, said that it was due to the omnibus skidding. The road was wet and greasy at the time. Arthur King, the driver of the omnibus, said that he was coming from Piccadilly Circus down Regent Street when the deceased drove a four-wheeled cab across the street in front of him. The witness put his brakes on sharply to avoid running into him. The road being greasy caused the wheels to skid, and the back part of the omnibus struck the cab, knocking the deceased off his seat. The skidding was caused by putting on the brakes too quickly. The pace at the time was only about six or seven miles an hour, and he had the omnibus under control.

The Coroner: I think the result shows that you had not, and that you had to put on your brakes under conditions that you knew might cause an accident. In summing up, the Coroner said that that was the second fatal case he had had which had arisen in consequence of injuries from motor-omnibuses. It was quite clear that connected with this new traffic there were dangers which had not been fully appreciated, and would not be until there was a considerable number of accidents. There was a special danger which was not attached to other vehicles, and that was the danger of skidding. It was for the jury to say whether the driver exercised reasonable care and skill. The jury returned a verdict of accidental death, and expressed the opinion that the driver did not use discretion in driving.

### PUBLIC MOTOR SERVICES.

TODMORDEN.—The Police and Sanitary Committee of the House of Commons, presided over by Mr. J. W. Wilson, have had under consideration the Todmorden Corporation Bill, which contains a novel proposal by a municipality to prefer motor-omnibuses to tramways. Mr. E. Moon, K.C., explained to the committee that some years ago the Corporation proposed to establish a tramway system, but the scheme fell through. Representations had been made to the Corporation that travelling facilities were needed, but the Corporation doubted whether the expense of laying tramways would be justified. It was proposed instead to establish a service of motor-omnibuses along four routes—from the Townhall to the tramway termini of Burnley, Bacup, Rochdale, and Halifax. Undoubtedly that would be more economical, and it was a moot point whether such omnibuses would not be better means of conveyance than tramways. It was now an acknowledged principle that

it was not only within the sphere, but actually the duty of a local authority, to provide means of conveyance by tramways, and he did not see why the same principle should not apply to motor-omnibuses, which were an equivalent means of conveyance. The committee decided to approve the clause.

A MOTOR-BUS service will shortly be commenced from Leigh-on-Sea to the adjacent towns and villages.

THE Great Eastern Suburban Omnibus Company intends to run a service of motor-buses between East Ham and Piccadilly Circus, London. A service is also to be run between Leyton and the Elephant and Castle. As yet there is no line of motor-buses running near the G.E.R. and N.L.R. termini in Liverpool Street and Broad Street respectively.

### ROAD REPORTS.

POLICE TRAPS.—On Saturday a police trap was in operation on the Brighton road at Sutton, just after leaving Banstead Downs. Traps were reported on Sunday near Acton, Uxbridge, Cricklewood, Hendon, and the regions round about. A police trap is in frequent operation between Hadley Common and Potter's Bar. There is a police trap in operation every Sunday in the Melbury Road, High Street, Kensington. Motorists on the way to Hyde Park or Hammersmith should proceed warily.

WANDSWORTH.—The New Streets Committee of the Wandsworth Borough Council has suggested that samples of tar macadam should be laid upon Tooting Bec Road, but this has been negated at the instance of the Highways Committee.

STAFFORD.—There are no paved roads or streets in or about Stafford, all are macadam, and for the last three years the borough authorities have used and will continue to use tarred macadam until something better for the surface of roads is discovered. The tarred macadam with a slight binding of grit forms a smooth and even surface, giving off much less dust or mud than ordinary dry macadam. Motorists, commercial travellers, and others have been favourably impressed with the condition of the streets and roads in the town.

### CASES AGAINST MOTORISTS.

THE first prosecution under the regulation prohibiting motor-car instruction in Richmond Park was heard at the Richmond Borough Court on Monday, when Leopold Harold Casway, of Brompton Road, W., was fined 20s. and costs for giving instruction, and Thomas Pow, of Chelsea, 40s. and costs for being so instructed.

BEFORE the Petersfield County Bench, Charles Hoffer has been summoned for not stopping his motor-car at the request of Captain Percy Seward, who alleged that he was in Dragon Street, Petersfield, in charge of a restive horse, and that he put up his hand as a signal for the purpose of the car being brought to a standstill. After hearing evidence the summons was dismissed. The prosecution then expressed their determination of proceeding with a second summons for driving the motor-car negligently in Dragon Street above mentioned, and a third for driving the motor-car at a speed which was dangerous to the public in Dragon Street, so that there were three summonses for the same incident. Mr. Staplee Firth, who defended, denounced this practice of several summonses for one offence as an unjustifiable procedure, and argued that the doctrine of "Autrefois Acquit" applied in this case, and that therefore the whole incident was disposed of by the result of the first summons. The Bench ultimately accepted this view and dismissed the other two summonses.

### MOTOR WAGON AND WEIGHBRIDGE.

In the Manchester County Court, before Judge Parry, Mr. Richard Garside sued the East Lancashire Motor Transport Company, Accrington, for £27 damages for breaking down a weighbridge in his yard.

Plaintiff's case was that the defendants brought a load of cotton waste on September 27th to their mill at Manchester. The load and wagon weighed over ten tons, and Mr. Garside and his manager, Mr. Thomas F. Heywood, swore that instructions were given to the driver of the motor-vehicle not to come over the machine. There was plenty of room to pass. The vehicle, however, was driven over the machine and broke it down. His Honour gave judgment for the amount claimed.

### DAMAGES AGAINST A MOTORIST.

MRS. JULIA HUSSEY, wife of the deputy lieutenant of the county of Kerry, residing in Elvaston-place, Kensington, claimed damages before Mr. Justice Ridley and a special jury for personal injuries caused, it was alleged, through the negligent driving of a motor-car by the servant of Mr. John Pullman, of Teddington. Negligence was admitted, and the only question was one of damages.

Mr. Low, K.C., for the plaintiff, said that the lady was seventy-five years of age. On October 26, 1904, she was being driven from Winchester to Hadbourne Worthy in a wagonette, accompanied by her grand-daughter. The defendant's motor-car, driven by his servant, ran into the wagonette and overturned it. The plaintiff was badly bruised and shaken. Her medical adviser ordered her abroad, and she stayed in Rome from January to April. She now claimed for the expenses of the trip.

The jury returned a verdict for the plaintiff, and awarded her £175 for expenses and £50 for personal injuries.

## COMMENTS.

### Cordingley's Motor-Car Show.

THE eleventh and most successful of all the motor-car exhibitions which Mr. Charles Cordingley has organised at the Agricultural Hall, London, will close its doors to-day (Saturday). From every point of view it has been the greatest of the series—in the volume of business done, the notice received from the Press, the number of really interested visitors, and the impetus it has given the selling season of the year. Already bookings have begun for the twelfth of these annual displays, and many who have not been present at that now in progress are inquiring as to the likelihood of their obtaining space at the next.

### The Aero Exhibits.

AS was the case last year, the Aero Club section of the Exhibition at the Agricultural Hall is proving a popular feature of the display, and even the most practical and substantial persons seem interested in the machines that threaten to invade the clouds. Here may be seen some famous balloon cars, including those of the club, the Hon. C. S. Rolls, and Mr. F. H. Butler, as well as a set of most interesting photographs taken by these gentlemen in the course of their ascents. The Jones model airship, a new corrugated iron flying machine, and other aeronautical models also add to the interest and variety of the display. Considerable interest is being taken in the photographs of the Frost-Hutchinson flying machine. In connection with this we may mention that by the E. P. Frost method of construction it is claimed to be possible to make gigantic feathers so like natural feathers that at first sight they might be taken for those of some fabulous bird like the "roc." Dr. F. W. Hutchinson informs us that a feather thus made measuring about sixteen feet in length will weigh less than that number of ounces.

### Farmers and Motors.

THE discussion that has been proceeding in our columns with reference to the adoption of motor vehicles by farmers in the conveyance of milk and farm produce has revealed an almost unsuspected interest in a quarter that was once heralded as hostile to the automobile. Of course, it was known that the presence of industrial motors at agricultural shows was an attraction, but not everyone knew the number of farmers who are actively following the course of events in the automobile world with a view of being among the first to utilise the new power as soon as a satisfactory all-round machine has been obtained. There is one aspect of the matter that has not yet been touched upon which seems to us to suggest new thoughts for those social reformers who have raised the cry of "back to the land." What is going to be the effect of the motor on labour in the country? Either the present labourer will have to equip himself to become something more than "a hewer of wood," and be prepared to cultivate mechanical knowledge, or some of the mechanics unable to find work in the towns will be glad to turn

again to village life and pursue the work of a skilled operative on the land. This would be a great gain if at the same time the advent of the motor on the land also enables men to cultivate small holdings instead of being ordinary labourers. There is little doubt that the future of some of the questions of unemployment is bound up with the development of the automobile.

### Ecclesiastical Favour.

VERILY things are moving rapidly. In some places chapels which stand isolated from great centres of population on the roadside are being translated into garages, and throughout the country bishops are becoming motorists. General Booth started the idea of pastoral visitation by automobile; Dr. Clifford and the Rev. F. B. Meyer developed its use as a political force during the General Election; the friends of the Bishop of Liverpool presented that distinguished prelate with a motor-car; and now the Bishop of Worcester has become an ardent believer in the use of the motor. The diocese of the Bishop of Worcester covers a great area, and he is conducting a series of special Lent services in many outlying districts which are difficult of access. The tour is being made in a motor-car, and before the mission ends the Bishop will have preached sixty special sermons and travelled nearly 900 miles by automobile. Hence the suggestion that the motor-car will contribute greatly to efficiency as well as celerity in all departments of terrestrial activity.

### 'Buses v. Trams.

IN many places the rival interests of motor-buses and tramways are arousing keen discussion, and even the London County Council is beginning to realise that its hurry with regard to the development of the tramway may have been too fast to be profitable in the end. The chairman of the Highways Committee of that body, Captain Hemphill, has just expressed the opinion that at some time in the near future the Council may find it advisable to seek Parliamentary powers to run motor-omnibuses as feeders to the Council's tramway system. Just as the railway companies are finding profit in running motor-buses as feeders to their lines in rural districts, so the proprietors of the trams may ultimately have to take passengers to their tracks by the same means.

### Motor Hackney Carriages.

THE Commissioner of the Metropolitan Police is considering new regulations for the licensing of motor hackney carriages in London, and likely users of such vehicles will do well to communicate their suggestions to the authorities without delay. As a general warning we would remind proprietors that before entering into contracts for new types of such vehicles they should certainly send the drawings to New Scotland Yard, London, for approval as to type. Carriages must be submitted for inspection newly painted and varnished. The total overall length of the chassis and body must in no case exceed 14 ft. nor the extreme breadth be greater than 5 ft. 9 in. Some difficulty

may be experienced with the regulation that the vehicle should be able to turn within a circle of 25 ft. diameter, and this is a point which the Motor Van and Wagon Users' Association might well consider. At the annual meeting on Tuesday it was decided to include "motor-omnibus" in the title and to take such vehicles within its purview. Hence the idea that motor hackney carriages may well come within the scope of its deliberations; and, looking at the proposed rules of the London police authorities, we would suggest that that with regard to the turning of vehicles within a circle of only 12½ ft. radius is one that should be carefully considered before being officially approved.

### The Trials.

TO-DAY (Saturday) is the announced date for the conclusion of the road tests of the car, tyres, lamps, speedometers, etc., now in progress under the supervision of the A.G.C.B.I., which, by the way, does not seem to have been particularly happy in the matter. Somehow or other an uneasy feeling has got abroad with regard to competitions in this country, and what with advice before the settling of rules, and correspondence after its events, the Club has been the cause of much writing to the papers—not always to the apparent advantage of the readers. In the old days competitions excited keen interest, their progress was watched by the Press and the public, and all things conspired to give them importance. Now they proceed with an easy quietness almost as silent as the cars at the Exhibition. No one seems to trouble as to their beginning or ending, and it would seem that there is need of a great revival in that section of official enterprise.

The Tyre Trials. Two of the Competing Cars in the snow near Staines. *Photo by] Argent Archer.*

### An Incident.

WE are informed, however, that excitement was restored to the Trials on Friday of last week, when the occupants of the Dennis car had an experience which is probably unique. When travelling between Newbury and Hungerford they were alarmed at the sight of some unknown figure coming rapidly in a direct line for the car. The passengers were quite prepared for a collision, and began to crouch below the wind shield, but, when only a few yards from the car, the ostrich—for such it proved to be—darted aside and swept by at a pace of about eighteen or twenty miles an hour. Another incident which occurred later in the same day disabled one of the cars to such an extent that it did not take part in the trials on Saturday. In Hammer-smith, a boy suddenly ran off the pavement, and, as the only means of saving the boy's life, the driver turned the car into the kerb and broke a front wheel. The Dennis car accomplished

non-stop runs all the week, and by Saturday night had a record of 3,331½ miles non-stop to its credit. The total distance then covered was 3,417 miles, the odd 85½ miles being deducted owing to an unavoidable stoppage on the first day of the event. The Daimler did not finish until fairly late on Saturday evening, having broken a spring at the Sunningdale level crossing. A temporary repair was made with wood, and the journey had to be finished very slowly.

### The Exhibition Catalogue.

With its entries of names and addresses as well as the particular exhibits of each firm, it presents a comprehensive view of the state of the motor-car industry, and thus has a permanent value. Beyond the copies sold at the Exhibition closing to-day (Saturday), it will have a wide circulation among the motoring public, who can order it through any bookseller or newsagent, price 6d.; or post free 10d. from Messrs. Cordingley and Co., 27-33, Charing Cross Road, London.

### Cylinder Capacity and Horse Power.

MR. DUGALD CLERK's paper at the A.C.G.B.I. had the advantage of exciting a really useful discussion, some of the main points of which we propose to give in our next issue. His subject was the vexed one of cylinder capacity and horsepower. The rating of an engine's power by means of cylinder dimensions is not a new problem. It arose immediately upon the perfecting of the steam engine by James Watt, and it produced a series of more or less divergent rules, beginning about the end of the Eighteenth Century, and terminating about twenty years ago. These rules were all intended to give the power of a steam engine directly from the cylinder dimensions. The power given by rule was long known as the nominal power of the engine, and steam engines were originally sold as so many horse-power nominal, capable of working up to some fabulous power, generally three times, and sometimes six times, the nominal power. Mr. Clerk is not without hope that, in the case of the petrol motor, no rigid rules may be formulated tending to impede progress and prevent engine designers varying proportions and dimensions of their engines in any way which they may think best adapted to secure improved results. Personally, he fears it is impossible to devise a rating rule which will enable us to accurately estimate the power of any engine from cylinder dimensions only. To obtain any such accurate rule would require uniformity of mean pressures, cylinder proportions, piston speeds, and engine revolutions, which would tend, in his view, to impede progress rather than assist it.

### Results of Experiments.

THE cylinder dimensions in the petrol engines used by Mr. Clerk for his experiments vary from 3½ in. diameter by 4 in. stroke as the minimum to 7½ in. diameter by 6 in. stroke; and the mean pressure equivalent to brake horse-power varies from 61 as the minimum to 81 as the maximum. The highest mean pressure actually exerted on the piston is 101.5 lb. per square inch, and the lowest 76.4. With pressures varying so much as this, it is obvious that no rule could be given depending on cylinder dimensions only, which would estimate, even with approximate accuracy, the power to be given by petrol engines. Two motors of exactly the same cylinder dimensions, with this variation in mean pressure, would vary as much as 25 per cent. in rated power. Judging, however, from these numbers, it appears to Mr. Clerk that it would be very near the truth to say that a petrol engine of first-class construction should give a brake equivalent of about 70 lb. per square inch mean pressure upon the piston. The engines from 6-h.p. to 15-h.p., excepting Dr. Watson's experimental

engine, vary from 750 ft. to 800 ft. piston speed per minute. Mr. Clerk thought it might then be considered with some justice that the piston speed of a good engine varying from 6-h.p. to 15-h.p. could be taken at 800 ft. per minute. The piston speed of the more powerful engines appears to vary more; from a 28-h.p. Humber to 60-h.p. Mercedes it varies from 862.5 ft. to 1,350 ft. A piston speed, however, of 1,000 ft. per minute appears to be very near the mark for all engines except racers. From the tests made Mr. Clerk suggested that for all petrol engines power might be calculated on the assumption of a brake equivalent of 70 lb. per square inch on the area of the cylinder, and for engines up to 12-h.p. piston speed 800 ft. per minute, and over 12-h.p. 1,000 ft. piston speed per minute.

#### Newspaper Drawings.

A STRIKING innovation in daily journalism has just been made by the "Pall Mall Gazette" in connection with its report of the Cordingley Motor-Car Show. The general Press has latterly awakened to the fact that the public is interested not only in the personalities of motorists but also in

auxiliary motor power to fishing boats was one of considerable interest. This had been accomplished with great success in the Fife herring drifters. These boats, which were about 72 feet long, had been fitted with a two-cylinder motor of 25-h.p., which had proved very satisfactory. Several lifeboats had also been fitted with motors, and in every case they had worked well and gave very little trouble. Mr. Redwood thought there was a great future for the motor torpedo boat. A remarkable vessel of this type had been launched recently by Messrs. Yarrow. It was provided with five engines, each having four cylinders and had attained a speed of twenty-six knots.

#### A Labour Dispute.

THE strike of the motor-bus drivers employed on the Kingsway route of the new London and Suburban Omnibus Company is the first labour dispute that has taken place in connection with the new form of traffic that promises so much for the improvement of means of locomotion in the Metropolis and other large cities. Of course, there are two sides to the question, and probably the "newness" of the occupation is one of the difficulties in the situation. Apparently there are

Sir Max and Lady Wasechter in their 20-25-h.p. Brotherhood Double Landulet, which they have now had in continuous use since last summer. This car is under the entire control of Sir Max Wasechter's head Coachman, the simple construction of the vehicle enabling him to drive and maintain the same, without any stoppages during this period.

[Dover Street Studios.

the mechanism of their cars. Our contemporary has not only recognised this fact but has had the enterprise to give diagrams in its Show report—an innovation suggestive of the great hold that the automobile has taken of the public, evidence of which has been apparent at Islington every day of the week.

#### Motor-Boats.

AT the annual meeting of the Royal National Lifeboat Institution, Lord Tweedmouth, First Lord of the Admiralty, referred to the motor lifeboat stationed at Newcastle-on-Tyne, and said they would shortly have three motor-boats going through their trials. Speaking on the same evening at the Society of Arts on "Motor-Boats," Mr. Bernard Redwood said it was in 1902 that the British and Continental motor-car manufacturers first began to turn their attention to the manufacture of motor-boats. The question of fitting

men who have taken advantage of the possibility of delays by mishap to loiter on the way, and the 'buses have not been worked up to their proper time table. To deal with such a state of things the plan of piecework was adopted, the men being paid according to the number of journeys travelled. Hence the bother. The drivers must be careful that they do not take advantage of their present unique position, as others are in daily training, and the supply of motor-bus drivers will ultimately be quite equal to the demand.

THE watchmakers, Messrs. Stauffer and Sons, who produced the three split seconds chronograph for Mr. T. H. Woollen, which finished on the same fifth at the close of all the events he timed for the Automobile Club, have just received the Kew Observatory Report that their split seconds chronographs obtained 1st, 2nd and 3rd positions for the year.

## OFFSET CRANKSHAFTS. AN ADVERSE VIEW.

IT is not only in this country that the subject of offset crankshafts, as a result of their adoption by such well-known firms as Mors and Brasier, is attracting attention. The question is also being discussed in America, and as an opposite view to that recently published in these columns is taken by Prof. James Hunsicker, the following summary of his article in the "Automobile Magazine" will no doubt be read with interest:—"Within the past two years," states Prof. Hunsicker, "the internal combustion engine has developed more problems for its designers than pioneers in motor building ever thought it capable of. The pioneers were, of course, overwhelmed by what have since become rudimentary matters, but which were at the outset of vital importance, for if they had not been solved by making the motor go, later questions could never have come into existence. One of these questions which is beginning to assume prominence is the matter of providing against the effects of the thrust of the connecting rod. In the ordinary steam engine the piston is provided with a crosshead running in slides, and this effectively takes up the lateral thrust of the connecting rod. This, of course, is not a part of the usual internal combustion motor, although examples have been provided in this respect in the

the centre of the cylinder, the angle which the connecting rod makes on the exhaust and compression strokes is considerably increased, but on these two it is doing very little, while on the working stroke the angle is appreciably lessened, so that the thrust of the connecting rod is as nearly as possible directly downward. The closer the latter approximates to the perpendicular the more efficient it would be in obviating the force in question, but this would not be advisable, as the return stroke would then be at an abnormal angle, with a similarly detrimental effect. However, with the proper amount of offset it is contended that the increased thrust of the return stroke is more than compensated for by its absence on the power stroke, which is doubtless the case. Other makers have adopted the plan of making the connecting rod as long as possible, but this naturally has closely defined limitations, particularly in the vertical engine.

The fact that a few prominent firms, upon investigation, have decided to adopt the plan is not necessarily indicative of its overwhelming merit by any means, and there is much to be said both for and against it. Many innovations have been adopted wholesale, only to be discarded after a short time, as witness the fate of the extra spark gap in the ignition circuit. The practical question presented is, Will the increased life of the engine built in this manner compensate for the necessarily

[Bariller, Le Mans.

same manner as the steam engine, but it is something that is out of the question on any engine for automobile use. The length of the piston has, in consequence, to be depended upon to diminish or equalize this thrust as much as possible; it does so to a certain extent, but its effects cannot be entirely eliminated by this method, and consequent friction and wear take place. The compact dimensions of the engine must, of course, be retained, and as at present constituted the long or trunk piston is apparently the most simple method, which nothing short of a revolutionary design can displace.

The question is not entirely new, by any means, as the Mors cars built for the International Cup race of 1904 were designed specially with a view to overcoming this effect by offsetting the cylinders—that is, mounting them to the side of least resistance, instead of centring them over the crank case, as is the usual practice. The advantages of this plan are apparent from a study of the working stroke of the engine. No work is being performed on the exhaust stroke, comparatively little on that of compression, and probably seven-tenths to nine-tenths of the service of the engine is centred on the explosion stroke, and it is on the latter that the evils of the lateral thrust against the side of the cylinder make themselves felt.

By offsetting the crank shaft a predetermined distance from

increased cost? And right from the outset it would seem that it must be answered in the negative. The reason therefor will be plain from a consideration of the present status of the life of some of the high-grade engines. The product of five years ago is not regarded very highly by the present-day owner and builder, the majority of whom are naturally recruits whose enlistment dates from a later time. Nevertheless, there are scores of Panhards and Daimlers ornamenting the highways to-day, and doing it in a silent, easy-going fashion that puts to shame many of their so-called successors of a later day. The motors in these old cars have seen more hard work than a great many of more modern make will endure, with few exceptions, possibly, without having had their cylinders rebored, yet they are good for unlimited future service. On the other hand, it may be granted, for the sake of argument, that at the end of five to seven years' running the cylinders will have lost their symmetry to the extent of requiring reboring. Will the cost of the latter exceed that of offsetting, with the probability of coming into the turner's hands in almost the same period? But there is still another side to the question that is to be found in the rapidly increasing homogeneity of the motor-car. Talking points are an absolute necessity for the sales department, and they must be had even at the expense of a slightly increased first cost."

## SOME CURRENT TOPICS.

### The Cordingley Show.

It is being freely admitted on all hands that the Exhibition at present being held at the Agricultural Hall is by far the most successful of those so far organised by Mr. C. Cordingley. From the point of view of those interested in automobile engineering matters the Show is of a particularly attractive character. As one walks round the gallery one continually comes across a small crowd of people all centreing over one spot, as if it were a scrimmage at a football match, the point of attraction being either an ingeniously-designed petrol motor or a new change-speed gear. Of both of these there are several novel designs on view. To refer to the Lége and Primat motors, it is safe to say that these are full of interest to students of the internal combustion engine. Without drawings, which we shall publish later, it is difficult to describe these engines. The Lége, how-

### The Italian Invasion.

Another striking feature of the show are the several new Italian cars on view, and which are seen in England for the first time. The Fiat and Florentia vehicles have already earned a reputation in this country. To these have now to be added the Fraschini, the Marchand, and the Milano, which, judging from the cursory inspection we have so far been able to give them, should quickly become favourites with British motorists, the details of construction being of a high order of merit.

### Six-cylinder Cars.

The tendency of the times is seen in the increasing number of six-cylinder cars which are making their appearance on the market, and the 1906 Cordingley Show will long be remembered in this respect, for it has seen the advent of the Humber and Hotchkiss "sixes," while before the week is out it is expected that the "National" six will also put in an appearance. It will probably be difficult to surpass the example of speed in the production of a new type of automobile just furnished by the Hotchkiss Company, at their St. Denis works, in France. Mr J. J. Mann, the company's manager, when recently in England was struck by the apparent predilection of the public for six

Mr. R. Middlemost, of Sedgfield Edgerton, Huddersfield, on his 22-23-h.p. Dennis Car.

ever, has six cylinders, the connecting rods working on to a sort of octopus claw, which has a curious dancing action, which results in giving a rotary motion to the fly-wheel shaft. The Primat, on the other hand, has four curved cylinders with correspondingly shaped pistons, all connected by a claw to a central spindle. Only one of the pistons is provided with a connecting rod. As the explosions take place the pistons oscillate in the cylinders, the method of boring which is proving a puzzle even to many of the engineering visitors to the Show.

### New Change-speed Gears.

A second class of exhibit which is attracting the notice of engineers is that of new change-speed gears. Of these there are quite a number, including the Newmobile, the Paradox, the Rillo, and the Churchill. All of these are well worthy of close inspection, the Churchill in particular appealing to public service engineers. The gears are always in mesh, and, no matter how brusquely a bus-driver may change speed, there is little likelihood of the gear being damaged. The Autoloc device for engine control and brake levers, too, is one of which more will doubtless be heard in the near future.

cylinder motors, and on returning to France set himself to design such a vehicle for exhibition at the Agricultural Hall. Pattern making progressed almost synchronously with the production of the drawings, with the result that from the time of the completion of the latter until the new Hotchkiss six-cylinder chassis emerged complete from the works only fifteen days elapsed. The chassis was conveyed to the carriage-builders without a road test, and in ten days was duly fitted with a body. Mr. Mann then at once started up the engine and commenced his journey to London, so that from the time of laying down the motor and chassis until the completion of his journey to Islington only twenty-seven days were occupied. The trip from Paris to London was accomplished without a failure or *panne* of any description, the route being *via* Dieppe and Newhaven. The entirely satisfactory character of this long test has induced Mr. Mann to decide on devoting in future the energies of the St. Denis works very largely to the manufacture of the new six-cylinder type of car.

REAR-ADMIRAL POE, commanding the East Indian squadron, has just acquired a Beaufort car.

## THE CRITCHLEY-NORRIS 'BUS.

(Concluded from page 68.)

STILL another noteworthy feature in the design lies in the engine control, which is effected by means of a single lever operating both the throttle valve and the advance and retard of the ignition, fitted below the steering wheel. The lever (Fig. 7), has a double movement; to vary the ignition it can be moved up and down within certain limits, and at any point in the vertical plane

Fig. 6.—Section through Friction Clutch.

Fig. 7.—Section through Steering Column, showing Single Lever Controlling both Ignition and Throttle.

it can be moved to open or close the throttle, in a horizontal plane, the lever being automatically locked in any position.

Passing now to the transmission, a vertical sectional view of the clutch, which is of the leather-faced cone type and of large diameter, is given in Fig. 6. It is of the self-contained thrust type, the male portion being arranged to run on ball bearings when withdrawn from the flywheel. The connections between the pedal and the clutch are shown in Fig. 12, from which it will be seen that the clutch is withdrawn by means of two eccentrics; a specially-designed dash pot *D* is also provided to prevent any shock should the pedal be released suddenly. So that no strain due to any deflection of the frame when travelling over rough roads may be transmitted to the clutch or gear-box, the shaft connecting the latter is provided with a universal joint at each end. The gear-box is adapted to give four forward speeds, of respectively three, six, nine and twelve miles per hour, and a reverse. All the shafts of the gear-box run on ball bearings of exceptionally large size. Reference to Fig. 8 will show that the gear-box is cast without a longitudinal joint, and that the gear shafts are fitted in with an end cover, by removing which all the shafts and gear wheels can be drawn out of the box without the latter being moved out of its position in the chassis. The driving shaft of the gear-box is made with four key ways cut out of the sliding shaft; the four wheels sliding on this shaft are put together in pairs, in order that the bearings of the box may be as close together as possible. The various speeds are controlled by a single lever working in a "gate" quadrant. From the gear-box the power is transmitted to the rear road wheels through side chains. Fig. 10 gives a sectional view of the differential shaft, the design of which is such as to enable the

parts to be readily dismantled when necessary. Like the change-speed gear case the box containing the differential gear is provided with end covers, on the removal of which the whole of the differential gear can be drawn outwards. The differential case, as well as the pinions, are mounted on ball bearings, adjustable ball thrusts being also provided in order that the main bevel driving gear and the differential wheels may be adjusted. The inner ends of the differential shafts are of square section fitting into corresponding holes in the differential wheels.

Two independent sets of double-acting brakes are provided, two contracting brakes on the differential shaft and internal-expanding brakes on drums connected with the hubs on the rear wheels. All the brakes are of the metal-to-metal double-shoe

Figs. 8 and 9.—End View and Sectional Plan of Change Speed Gear Box.

type; those on the differential shaft are compensated one with the other, and are actuated by a pedal. The road wheel brakes are similarly compensated, and are operated by a pull-on hand lever, details of the ingenious arrangement adopted being given in Fig. 12. The steering gear is of strong and reliable design; the steering wheels are so set that they automatically compensate themselves radially on either lock. The steering is controlled by means of a nut and screw enclosed in an oil-tight box with a specially designed double-thrust bearing. The road wheels are built of steel; the rear pair are 36 in. diameter, fitted with twin 5 in. rubber tyres, and the front wheels are 30 in. diameter, with 5 in. single tyres. From the foregoing brief description it will be seen that the new Critchley-Norris vehicles possess a number of special features which should strongly appeal to engineers.

## CONTINENTAL NOTES.

### The Ostend Automobile Week.

At a meeting of representatives of the Automobile Clubs of Ghent, Bruges, and Antwerp, it was decided to hold the Ostend automobile week in July next. The contest for touring cars will be held on July 14th over the same circuit as last year, large vehicles having to cover 500 kilometres and the smaller classes 250 kilometres. On July 15th there will be an excursion to Bruges, and on July 16th a series of mile, kilometre, and five kilometre speed trials on the Snaeskerke road.

### Motor-Buses in Paris.

Two new services of motor-buses are shortly to be started in Paris, one between Montmartre and St. Germain-des-Près and the other between the Hotel de Ville and the Porte Maillot, at the entrance to the Bois de Boulogne.

### The Grand Prix de l'A.C.F.

The rules relating to the race for the Grand Prix de l'A.C.F. provide that each competing firm will be allotted two points on the course where stores may be kept, but no workmen will be allowed. On the first day the start will take place at 4 a.m.; the time on the second day has not yet been fixed, but the vehicles will be despatched at the same intervals as those at which they finished on the first day. Each competitor will be allowed to have two men at the starting point for the purpose of turning the engine starting handle. All cars finishing four hours after the leading one on the first day will not be allowed to start on the second half of the race.

Fig. 10.—Sectional view of Critchley-Norris Differential Shaft. (See page 86.)

D. Ball Thrust Bearings.

### Another French Touring Competition.

The Automobile Club Forezien of St. Etienne is organising a three days' touring contest to be held on the 30th and 31st April and 1st May next. The competitors will be divided into six categories as follows: (1) single-cylinder cars, (2) double-cylinder vehicles, (3) four-cylinder cars of a cylinder bore of not more than 90 mm., (4) ditto from 90 to 100 mm., (5) ditto from 100 to 110 mm., (6) ditto from 110 to 120 mm., (7) ditto over 120 mm., and (8) large covered touring cars. The single-cylinder vehicles will be required to carry two persons, and all the others four passengers. The route to be covered is—April 30th, St. Etienne—Avignon, April 31st, Avignon—Saint Audeol, and May 1st, Saint Audeol—St. Etienne. The awards will be based on average speed, regularity of running, and speed on hills. The entry list closes on April 14th.

### Motor Vehicles for Fire Brigades.

The Fire Brigade of the town of Nancy has been equipped with two motor-vehicles. Both were supplied by Messrs. De Dietrich and Co., one being arranged for the conveyance of firemen, hose, &c., and the other as a pump; the latter is also arranged as a tractor for the fire escape.

### A Spanish Motor-cycle Race.

A motor-cycle race for the Sama cup was run off in Spain on Sunday last. The course was from Tarragona to Villafranca and back, a distance of 207 kilometres, which was covered by Senor Escoda, on a Goricke machine with 5-h.p. Minerva motor, in 4 h. 20 m.

### The Mont Cenis Hill-Climbing Competition.

The Mont Cenis hill-climbing competition organised by the Turin Automobile Club is to be held on July 15th next. Categories will be provided for racing cars and for public service vehicles having accommodation for twelve passengers.

### Miscellaneous Items.

The Rhenish Automobile Club is organising a hill-climbing competition on the Konigstuhl Hill, near Heidelberg, for the 22nd April.—The Rochet-Schneider Company are reported to

Fig. 11 and 12.—Elevation and Plan of Clutch and Foot Brake Lever Connections on Critchley-Norris Bus. (See page 86.)

be building a new 160-h.p. racing car.—The entries for the Gordon Bennett balloon race are now closed. Six countries have entered, and it is probable that sixteen balloons will start:—England, Germany, France and Spain three each, the United States two, and Italy and Belgium one each.—A new motor airship is being built at Moissan for the French War Department. It is to be fitted with a 65-h.p. petrol motor and is expected to attain a speed of 45 kilometres per hour.—Under a new Customs tariff which has lately come into force in Dalmatia an English motorist has just had to pay a sum of £80 as duty on taking his car into the country.—The starting point of the Grand Prix race will be just near Pont-des-Gennes, a village located about 12 miles from Le Mans; the entries so far include three each Darracq, Panhard, Brasier, and De Dietrich cars.

## THE CADILLAC LIGHT TOURING CAR

At the depot of the Anglo-American Motor Car Company, Limited, we had an opportunity last week of inspecting an example of the latest model of the Cadillac light touring car, of which an illustration is given herewith. The frame is of pressed steel construction, and is supported on the axles by three springs—two longitudinal ones at the rear and a transverse spring at the front, the latter being fitted to the frame through rocker joints to allow for any deflection due to road inequalities. The motive power is supplied by a single-cylinder horizontal engine of  $8\frac{1}{2}$ –10-h.p., the cylinder dimensions being 5 in. bore by 5 in. stroke. A feature of the engine is the provision of a copper water jacket. The water circulation is maintained by a pump and a ribbed tube radiator, the space under the bonnet being occupied by a well-arranged tool box and the water tank. The ignition is by means of a coil and batteries, a speciality being the employment of a double-insulated sparking plug. The speed of the engine is regulated by varying the lift of the inlet valve, this being controlled by a lever on the steering column. The lubrication of the motor is effected by means of a mechanical oiler, operated by a trip gear on the boss of the flywheel, and equipped with four individual feeds, one for the piston, one to the connecting-rod and crank bearing, and one to each of the two main bearings. A useful device is that by which it is impossible to fix the starting handle in position when the ignition is advanced, so that there is no chance of the driver being injured owing to a back fire. As the ignition is advanced a

sliding piece covers the end of the shaft on which the detachable starting handle fits, so that it cannot be placed into position until the ignition is retarded. To facilitate the starting of the engine a half compression device is provided. The petrol tank is placed directly underneath the front seat, and carries about seven gallons. It is provided with partitions, which prevent undue splashing, while another partition forms a separate compartment holding about one gallon. When the petrol in the main compartment has been consumed the motor will, of course, stop, which gives notice to the driver that but one gallon remains in the reserve compartment, and that it will be necessary soon to renew the supply. The reserve may then be transferred to the main tank by simply opening a valve. Two speeds and a reverse are provided by a gear of the planetary type mounted on an extension of the crank shaft, from which the power is transmitted to the rear axle through a single centrally-located chain. The slow speed is applied by a foot lever and the high speed and reverse by a hand lever at the side of the car. The brake mechanism consists of two friction bands which contract on drums on the rear axle differential, they being applied by a foot lever. The latter is equipped with pawl and ratchet so that the brake can be held at any tension desired. The steering mechanism is of the rack and pinion type, and is operated by means of an inclined wheel. The chassis is, as will be seen, fitted with a luxurious double phaeton side entrance body. The dashboard, which is constructed of pressed steel, is of the curved type, protecting the ignition coil and switch which are mounted on it. The rear axle

is provided with roller bearings and a differential of the spur gear pattern. The front axle is of steel tubing with forged spindles, the front wheels being fitted with ball bearings. We may add that all parts of the Cadillac motor, as well as those of the chassis, are made on the interchangeable system, so that spare parts may be obtained on the shortest notice.

## USEFUL NOTES.

It occasionally happens that the stem of an exhaust-valve is slightly longer than it should be, so that the valve is prevented from closing properly. The spare exhaust-valve, which ought always to be carried, should be examined for this defect (best done by placing the valve in position and seeing whether, when it is closed, there is the usual clearance between the end of the stem and the tappet), and if found too long should be filed off. This is a process which is better done at home than at the roadside.

If necessity occasions the taking down of an engine, carefully watch the parts. If the manufacturer has not marked the various parts for their respective places, the motorist himself should do so. Take the case of valves. Exhaust valves will not always interchange, and if one, at some time or other, has been ground in a little more than the one next to it, it is hardly likely to suit that cylinder. Apart from the fact that the seatings will not agree, there is naturally a slight difference in the length of the stem, which is enough, sometimes, to spoil the compression through the valve not seating properly.

A MOST tantalizing, but not infrequent, cause of puzzling intermittence in the running of a petrol motor is a floating particle, such as a thin flake of solder which has been detached from the carburettor, or has entered the float chamber from the tank. Carried in the intermittent current of the liquid, it may suddenly become lodged so as to cover the capillary duct to the nozzle, preventing all egress of petrol. When the motor stops the petrol in the float chamber ceases to be stirred, and the particle finds a new position. When the motor is started again it is not in the way, but presently it returns and stops the motor again. Should engine troubles be experienced the float chamber of the carburettor may therefore be included in the parts to be inspected.

THE universal joints of cardan shafts do not, in many cases, receive the amount of attention due to them at the hands of those responsible for the running of the car. The joints get a far greater amount of work to do than they are generally credited with, and owing to their generally inaccessible position they receive but little attention. The chief point is to keep the joints well lubricated and free from grit and dirt, which is so disastrous to their long life and sweet working. A simple way of accomplishing both objects is to encase the joints in a flexible covering filled with grease.

WHEN replacing a broken ball in a ball bearing it is better to renew the whole set, unless the new ball can be carefully gauged to be of the same size as the others. If this is not attended to, the new ball, having to bear more than its share of the weight, quickly succumbs. The greatest care should be taken, of course, to use grease free from grit, and to clean the balls and bearings before they are replaced.

How few novices use the clutch of a car properly! They obtain their new car, start off on it, change the gears, letting in the clutch "bang" each time, and wonder that the car does not get away. A delicate use of the clutch is essential for good driving, as the engine should always be allowed to "get away" before the clutch is fully engaged.

WHEN leaving the car at night, or for any length of time, make it a practice to shut off the petrol supply. If this is not done, and if there is a leak, or a flooded carburettor, a fire may be caused by someone carelessly tossing a burning match under the car.

MR. WILLIAM LEA'S next auction sale at Liverpool is on the 2nd prox.

It is interesting to learn that a Daimler vehicle has secured the premier position in the first Continental race of the season, the Cannes Automobile Club's cup having been won by Mr. Griggs on a 35-45-h.p. car.

"MOTOR ENTERPRISES" is the title of the latest company of automobile interest registered at Somerset House.

THE capital of the newly registered Motor Trading and Contract Corporation is £20,000.

AMONG the visitors to the Show this week has been M. Thery, the winner of the 1904 and 1905 Gordon Bennett races,

and who is now establishing works near Paris for the manufacture of Thery cars.

MR. AND MRS. C. N. WILLIAMSON have started from Mentone on a motoring trip through Spain.

MR. E. D. HEINEMANN has opened a garage and show-rooms at 26, Cranley Mews, South Kensington.

MR. H. J. LLOYD, of Davygate, York, is developing considerable business in the city as an automobile engineer.

MESSRS. LAMPHORNS AND Co. have opened at 20, Long Acre, W.C., with a fine selection of motor-car accessories.

PART 27 of "Harmsworth's Encyclopædia" contains an excellent article on motor-cars, motor-cycles, and motor-boats.

MR. A. C. SWINTON, chairman of the Arrow Omnibus Company, has ordered a 22-28-h.p. Crossley, to be fitted with a luxurious phaeton touring body with Cape cart hood.

MESSRS. CONNOLLY BROTHERS, who have lately come into touch with motorists in connection with the leather-work of cars, have issued an attractive description of their works in Chalton Street, London, N.W.

FOR the "Coppa d'Oro" tourist meeting in Italy, to be held from May 15th to 25th, the Continental Tyre Company are offering prizes to the value of £480 to cars on Continentals which arrive first, second, third and fourth in the different classes.

IN view of the rapid development of the motor-omnibus industry the Brush Electrical Engineering Company, Limited, is assisting the British Automobile Development Company, Limited, which has works adjoining those of the former concern at Loughborough.

THE Empire Engineering Company, of Failsworth, Manchester, have sent us a copy of the new catalogue they have just issued of the Empire-Murray valveless force feed lubricator for use on motor-cars. The device, which was introduced by Mr. Blackwood Murray, of the Albion Motor Car Company, has already been illustrated in the *M.C.J.*

A 10-h.p. Argyll Mail Van supplied to the Peterborough Motor Company for the conveyance of the Local Mails.

MR. J. C. WOOD is the governing director of the Safety Motor Screen Company, Limited, which has been registered with a capital of £1,000.

MR. W. K. PERRENS has opened a motor-car showroom at 263, Deansgate, Manchester. He will have a garage near the Midland Hotel.

THE Belsize London Agency has been registered with a capital of £11,000. The directors are Messrs. F. Loeser, R. A. Unthank, and J. E. H. Monypenny.

THE Earl of Shrewsbury, the Marquis of Salisbury, and Lord Dundonald have been among the visitors to the Show at the Agricultural Hall, which closes to-day (Saturday).

MESSRS. STRADLING AND PLENTY, LIMITED, of Newbury, have the management of the extensive motor garage on the new racecourse, the next meeting on which takes place on April 4th and 5th.

THE Yorkshire Mutual Garage, Limited, of Woodhouse Lane, Leeds, has commenced business, and, in addition to garaging and repairing cars, will shortly hold auction sales of automobiles.

NEW motor accessories showrooms have just been completed at Messrs. Gamage's establishment in Holborn. The firm are now stocking their tyres in dark rooms, where an equable temperature is always maintained.

THE Great Eastern Motor Trust has been registered with a capital of £1,000; the capital of the Great Eastern London Motor Omnibus Company, which has been registered to adopt an agreement with the Trust, is £405,000.

MR. ROWLAND WINN has opened new show-rooms at 34A, Albion Street, Leeds, where he is stocking cars, accessories and clothing. This is in addition to the garage at 11, Albion Street, where repairs will still be executed.

MR. G. F. FERRAND, of Hoddington House, Winchfield, Hants, who has a 22-28-h.p. Crossley, writes that his car is going extremely well. He has now driven it almost 5,000 miles and, except for a choked petrol pipe on one occasion, has had no mechanical trouble on the road.

WILLIAM AUSTIN was sent to prison a couple of years ago at Slough for placing wire across the Bath road to hold up motor-cars. He was arrested last week by Sergt. Pearce, and was sent back to gaol for seven days for lopping off the shrubs in the garden of the officer who arrested him.

THE 35-h.p. "Brooke" Car just delivered by Messrs. J. W. Brooke and Co. to the Hon. A. E. Guinness. The car has a 10 ft. wheelbase, the engine develops 55-h.p. De Cadignan spring wheels are fitted at both back and front. The body, by the Burlington Carriage Company, is of the usual double brougham type, luxuriously upholstered and finished in sealing wax red lined out in black, with silver plated furniture.

VISITORS to the Talbot Works at Ladbroke Grove, W., will see a long list of police traps posted up on the drivers' board. This is not merely a warning to avoid trouble but an instructor to protect others, for Talbot drivers are furnished with a stock of red confetti, and when a trap is located this is scattered on the roadway at the beginning and end. It is therefore an intimation to all motorists to be careful when they see red confetti lying on the road.

## The Cordingley Show.

[Continued from page 74.]

BELOW we continue our report of Cordingley's Motor-Car Exhibition, which has drawn practically all the automobile world to the Agricultural Hall, London, during the week. In our next issue this account will be continued, and both exhibitors and visitors will thus find in our columns a complete report of this great event. Saturday, the 31st inst., is the closing day, and, as several novelties have come into the Hall since the opening of the Show, many enthusiastic motorists will probably take the opportunity of repeating their visit.

### The Isotta-Fraschini Cars.

Reference has frequently been made in the *M.C.J.* to the rapid progress which Italy is making in the automobile industry. An excellent exemplification of this is found in the number of Italian-built cars on view at the Show, as, in addition to the Fiat and Florentia vehicles, which are already well known in this country, three new types are shown

all shafts, including those of the engine. The usual spring horns at the rear are replaced by halves of semi-elliptical springs. Special attention has been paid to the lubrication, grease cups being fitted to all the connections of the steering mechanism.

### Messrs. J. Keele and Co.'s Exhibit.

Messrs. J. KEELE AND CO. occupy two stands, on which are shown a number of the latest models of Darracq and Spyker cars. Of the former the exhibit includes specimens of the new 10-h.p. and 20-32-h.p. models, both fitted with double phaeton side-entrance bodies, as well as the 10-h.p. chassis equipped with the special English-built landaulet body, illustrated in the *M.C.J.* last week. The Spyker cars, for which Messrs. Keele are London and South-east of England agents, are represented by a 14-18-h.p. double phaeton, a 20-28-h.p. car with highly-finished landaulet body, and a 25-38-h.p. chassis. All are fitted with four-cylinder engines,

Fig. 10.—Chassis of the Isotta-Fraschini 28-35-h.p. Car.

known respectively as the Marchand, Milano, and Isotta-Fraschini. All of these combine many features of interest and take a high rank in automobile construction. Dealing now with the Isotta-Fraschini cars, the British agency for which has been secured by Messrs. HALL AND CAPRIS, two sizes are on view, viz., 16-22-h.p. and 28-35-h.p. (Fig. 10). As, except for the size, the two models are on identical lines, the following description may be taken as applying to both. In general arrangement the vehicles follow the usual lines of chain-driven cars. The frames are of pressed steel narrowed in front to increase the lock of the steering wheels. The engines comprise four cylinders, cast in pairs, 130 mm. bore by 150 mm. stroke in the case of the 28-35-h.p. and 100 mm. by 130 mm. in the 16-20-h.p. The valves are all mechanically actuated, being located on opposite sides of the cylinders. The water circulation is by pump and honeycomb radiator, the flywheel being arranged to act as a fan. Ignition is by high-tension magneto, and the speed of the engine can be controlled both by hand and foot levers. The carburettor is of a special design, the feed of petrol being varied in proportion to the regulation of the air supply. The clutch is of the multiple disc type and the change-speed gear, which gives four speeds forward and a reverse, is operated by a lever working in a "gate" quadrant. The final drive is by side chains, large sprockets being used. One of the pedals is connected up to two brakes, one being located on the differential shaft and the other on the forward end of the side shaft in the gear-box; both being provided with water cooling. The rear brakes are of the internal expanding type. Ball bearings are fitted to

the crank shafts of one size being provided with ball bearings. A notable feature of the cars is found in the steel frame, the sides of which extend downwards and inwards to support the engine and gear case. The cars are of the cardan shaft driven type, with direct drive on the top speed, and have become favourably known not only from their satisfactory operation, but also from their freedom from dust-raising proclivities.

### The Orion Omnibuses.

Messrs. MOSS AND WOOD are exhibiting two vehicles, practically identical as to the chassis, but one fitted with a double-deck omnibus body, and the other with a twenty-two-seated char-à-banc body. The 'bus is the seventh delivered to the Victoria Omnibus Company, owners of "The Old Vics," and who are so satisfied with the Orions that they are confining their stock to the one make. These chassis are made by the Orion Gesellschaft of Zurich, and the engine is of the horizontal opposed type, with two cylinders, 160 mm. diameter by 180 mm. stroke, and mechanically operated valves, with two very short cam shafts and long tappets. The whole of the engine is under the 'bus body, allowing a very short wheelbase—viz., 11 feet. The carburettor is at the extreme front of the chassis, with gravity feed, from a tank which forms the dashboard. The ignition is by a chain-driven high-tension Eisemann magneto. The cylinders are arranged fore and aft, with the crank-shaft parallel to the axle; a leather-faced cone clutch in the fly-wheel transmits the power through a silent chain to the gear-box. The gears provide four forward speeds, operated by a hand lever on the steering pillar, and the reverse is applied by a pedal, when the forward gears are out. The

final drive is by roller chains to sprockets on the rear road wheels. A tubular radiator is fitted under the centre of the body, and the water is circulated by a centrifugal pump, gear driven off the crank shaft. The driver is given separate control of the ignition, air and throttle, and the engine can be slowed down to run at a remarkably low speed. The steering is by rack and pinion, and the wheels are relatively small, the front 2 ft. 9 in. diameter, and the back 3 ft. They are of the artillery type, and are fitted with Polack solid rubber tyres. Messrs. Moss and Woodd are the sole selling agents for the British Empire for "Orion"

110 mm. bore by 130 mm. stroke. The valves are mechanically operated off separate cam shafts. High tension Eisemann magneto ignition is employed, with the alternative of coil and accumulators. Special attention has been devoted to the lubrication of the engine. The power is transmitted through a large leather-faced clutch and a long cardan shaft to the gear-box, which provides three forward speeds and a reverse. The gear-box casing also contains the differential, and is of compact design, in addition to which ball bearings are employed throughout, including the differential shaft bearings inside the

Fig 11.—The Prunel Double-deck Motor 'Bus.

Fig. 12.—Plan of Chassis of Isotta-Fraschini 28-35-h.p. Car. (See page 91.)

commercial vehicles, and are very busy with orders for all kinds of service.

#### The Prunel 'Bus.

LA SOCIÉTÉ DES USINES PRUNEL are exhibiting a chassis of their 30-33-h.p. motor-bus, also the identical 36-seated vehicle (Fig. 11), which last week successfully made the journey by road from Paris to London. The frame is of channel section, unusually deep and strong: it is stayed by three cross members, and is narrowed in front of the driver's seat to increase the lock of the steering wheels. The motive power is supplied by an engine having four separate cylinders

chain sprockets. From the differential shaft side roller chains convey the power to the rear road wheels. The latter are of the Soulas type shod with Gaulois solid tyres. Altogether the Prunel vehicle appears to be designed and built on substantial lines that should render it well suited for the rough work motor-buses are called upon to perform.

Though not closely connected with motoring, the "Sunbeam" electric light bath shown by Mr. C. M. HOLMQUIST makes an attractive display to the public. The bath is made in sections, readily set up in position, and its invigorating effects are undoubted.

**The Sizaire-Naudin Light Car.**

By far the most novel of the small two-seated cars to be seen in the show is the Sizaire-Naudin, the agency for which has been secured by Messrs. T. J. HARMAN AND CO. A very full description of the vehicle was given in the *M.C.J.* of December 16th last, but we may say that throughout the designers of the car have struck out on original lines. To begin with the frame, this consists of two long wooden side members bent inwards towards the front end to increase the lock of the front wheels. The two members are not connected together at the rear, but are provided with stay rods about the centre of the frame, and at the front end are attached to a cross steel bridge, on a projection from which a semi-elliptic spring is supported. The usual front axle and side springs are done away with, the cross bridge terminating in vertical sleeves in which the pivots of the steering wheels are not only free to turn in the usual way, but also to rise and fall against the action of the spring. The rear suspension is also on novel lines, the axle being connected to a point slightly behind the centre of the frame by bow-shaped plate springs. Coming now to the motive power, this is supplied by a 7-h.p. single-cylinder engine. The carburettor is of the automatic air-regulation variety, while the advance and retard of the ignition is automatically varied by means of a small centrifugal governor E (Fig. 13); in this way the usual air and ignition levers are done away with. The water circulation is on the thermo-syphon system, no pump being used. The water tank practically replaces the usual dashboard. The fuel is carried in a tank under the bonnet, and at its side is mounted a box which contains the accumulators and coils; with the exception of a short one from the contact maker below, there are no ignition wires about the car, the proximity of the motor to the coil enabling the connection between the latter and the sparking plug to be made by means of a spring piece C. The clutch is of a special metal-to-metal type, and consists simply of a flat disc which fits close up to and

Fig. 13.—Elevation of Chassis of Sizaire-Naudin Car.

|--|-----------------------------|--|
| A. Accumulator and coil.                   | G. Front transverse spring. | N. Change speed and hand brake levers.     |
| B. Sparking plug.                          | H. Petrol tank.             | O. Sector operating change speed gear.     |
| C. Pin connection with coil.               | I. Water tank.              | P. Cardan shaft.                           |
| D. Contact maker.                          | J. Lubricating oil tank.    | Q. Differential and change-speed gear-box. |
| E. Automatic advance and retard mechanism. | K. Clutch.                  |  |
| F. Radiator.                               | L. Clutch spring.           |  |
|  | M. Clutch and brake pedal.  |  |

against the inner face of the flywheel. The next novel point about the car is that no gear-box, in the usual sense of the term, is employed, a cardan shaft conveying the power to the rear live axle. The gear, which gives three speeds forward and a reverse, is all contained in the differential casing. The cardan shaft has on its end three pinions of an angular form, the largest of which is only 4 in. diameter, and the smallest 35 mm., or less than 1½ in., any of which can be brought into mesh by a cam device with the large angular crown wheel surrounding the differential gear. The cardan shaft is so arranged that it moves laterally to a sufficient extent to allow for the variation in diameter of the three pinions, the sleeve in which the rear end is carried being provided with a sliding piece forming a lid through a closely-fitting hole in which the shaft passes. The makers state plainly that the car is only designed to carry two persons, but claim that it will do this up all hills likely to be met with.

**Lubricants, etc.**

Lubricating oils for petrol, oil and steam motors are shown by PRICE'S PATENT CANDLE COMPANY, LIMITED, whose experience in this department has become of considerable value to motorists. Manulav, the new soap for cleaning hands, is naturally a special attraction, appealing, as it does, to motorists of all degrees. The Cirogene is a wax graphite preparation for the efficient lubrication of heavy motor chains that has come much to the front of late months. Rangraphine, Rangoon oil, Belmoline solidified oil, and lubricating oils for every part of the automobile where such are required are also shown.

**Aluminium.**

Mr. R. W. COAN occupies his familiar corner near the entrance to the Hall, and thus draws the attention of visitors to the facilities he possesses for the repair of aluminium parts. At his foundry he is well equipped for practical work in pure and hardened aluminium for turning and other purposes, repairing cracked or broken gear or motor crank cases. Several specimens of fine work in aluminium are shown of general interest, as well as of value to the automobile industry.

**The Ader Cars.**

A car which deserves to be better known in England is the Ader, made by the Société des Automobiles Ader. For the 1906 season the vehicles are being made in three sizes—16-20-h.p., 20-24-h.p., and 25-30-h.p., the one exhibited by Messrs. J. C. LYELL AND CO. being of the 20-24-h.p. type. The engine (Fig. 15) is of the vertical four-cylinder type, the old-style V engine, which formerly was a feature of the Ader cars, having been practically abandoned. The cars are of the side chain-driven variety, although we are informed that the 16-20-h.p. and

Fig. 14.—Front View of Chassis of Sizaire-Naudin Car.

20-24-h.p. vehicles are also being turned out with a cardan shaft, bevel gear transmission, in which the live axle has only the strain of the drive to withstand, the wheels, which are driven through dog clutches in the hubs, being carried by the axle sleeve. A feature of the engine is that, in place of the usual four supporting arms, the crank chamber is provided on each side with a lip running the whole length. This not only forms a means of solidly supporting the engine on the pressed steel frame, but provides a platform on which the pump, magneto, carburettor, etc., can be mounted. The cylinders are separately cast, and have the valves mechanically actuated from two cam shafts. The pump and high-tension magneto are gear driven, the latter being removable by the withdrawal of three bolts. Coil and accumulator ignition is also provided as a stand-by. The shaft between the gear-box and leather-faced cone-clutch is provided with a joint which enables the latter to be readily dismounted; like the engine, the gear-box is supported on the frame not by arms or brackets, but by lips extending its whole length. Four forward speeds in addition to the reverse are provided, the drive on the

Fig. 15.—The Ader Four-Cylinder Motor.

top speed being direct. In the chain-driven type the differential is separate from the gear-box, so that, by employing varying lengths of shaft between the two, cars of different wheel base can be turned out.

MESSRS. G. W. SHELDON AND CO. take advantage of the opportunity of bringing before the trade as well as the public the facilities they possess for the packing and transport of every description of automobiles.

**The Leon Bollee Cars.**

The Cannstatt Automobile Association show two excellent specimens of the Leon Bollee 25-30-h.p. cars. The engine comprises four cylinders, 106 mm. bore by 130 mm. stroke, the valves being mechanically operated by separate cam shafts. There are two systems of ignition—high-tension magneto and accumulators and, while separate plugs are provided, we note that the advance and retard of the dual ignition is controlled by a single lever on the steering-wheel. The mixture is furnished by a Leon Bollee automatic carburettor, a feature of which

Fig. 16.—Leon Bollee 25-30-h.p. Car with removable Top Landaulet Body.

is the provision made for adjusting the aperture of the spraying jet. The throttle is controlled by hand from the steering wheel, and also by the clutch pedal. The transmission is by side chains, the gear-box, the shafts of which are mounted on ball bearings, being adapted to give four speeds forward and a reverse. A useful fitting is found in a switch-lock, so that, when the car is left alone at any time, the switch can be locked by a detachable key.

**The Robinson and Hole.**

An interesting addition to the list of British cars is seen in the 16-20-h.p. chassis exhibited by Messrs. ROBINSON AND HOLE, LIMITED,

employed to furnish the mixture, the feed of petrol through the spraying jet being varied, up to a certain point, in proportion to the throttle opening. The speed of the engine is controlled both by a hand and a foot lever, the former being set at the lowest point. Any increased engine speed is then obtained by the foot accelerator, and when this is released the motor slows down to the rate provided by the hand control. Although provision is made for a magneto, the ignition

Fig. 17.—Chassis of Robinson and Hole 16-20-h.p. Car.

on the chassis exhibited is by coil and accumulators, a high tension distributor being employed. The water circulation is maintained by a gear-driven pump and rubber pipe radiator, the arms of the flywheel being made to act as a fan. The clutch is of the leather-faced cone type; it transmits the power to a gear-box

Fig. 18.—The Morris 17-23-h.p. Single Landaulet. (See page 95.)

of Thames Ditton. The car is of the cardan shaft driven variety, and in general design follows the standard arrangement of this type of vehicle. It is, however, marked by its simple lines and solidity of construction. The engine comprises four cylinders 90 mm. bore by 110 mm. stroke, cast in two pairs. The valves are operated off separate cam shafts. A special form of automatic carburettor is

giving three speeds and reverse, with direct drive on top speed, controlled by a lever working in a gate quadrant. The cardan shaft is fitted with a special form of universal joint, while three torsion rods are provided to give rigidity to the rear live axle, which has only the driving effort to transmit, the weight of the car being carried by the axle sleeve on which the road wheels are mounted,

the latter being driven by dog clutches in the hubs. The steering gear is provided with a simple method of adjustment by means of eccentric bushes. Ball bearings are used on all shafts except those of the engine, which are of Messrs. Willans and Robinson's special bearing metal.

#### The Mors Cars.

The stand of Messrs. MORS, LIMITED, is the centre of considerable interest, the cause of the attraction being the chassis of the 28-h.p. car fitted with the Mors self-starting device, an illustrated description of which was given in our report of the Paris *Salon*. For the 1906 season the Mors cars are being made in three different sizes, viz., 17-h.p., 28-h.p. and 45-h.p., all having four-cylinder engines and frames sufficiently long to take side-entrance bodies. All the cars have pressed steel frames; the 28-h.p. and 45-h.p. have two systems of ignition—low-tension magneto and accumulators, and a special form of automatic carburettor furnishes the mixture. The four cylinders are cast in two pairs, and a noticeable feature lies in the fact that the vertical axis is not coincident with that of the crank shaft, the cylinders being displaced slightly to the right, towards the magneto side. The valves are arranged on opposite sides of the engine, the inlets on the 45-h.p. cars being provided with a variable lift device controlled from the dashboard. No centrifugal governor is fitted, the speed of the engine being controlled by the throttle valve, which is automatically closed as soon as the driver de-clutches. To obtain, however, absence of noise and the minimum consumption of petrol, in addition to the admission being throttled, the lift of the inlet valves is variable by two cams joined together by an inclined plane. A lever placed near the steering column causes the whole of the cam shaft to slide along horizontally, bringing the different steps of the cam underneath the rollers attached to the valve-lifting mechanism. The cooling of the cylinders is effected in the usual manner by a pump which forces water, already cooled by the framed ribbed-tube radiator, through the cylinder jackets, a fan being also now provided. The lubrication is effected by a small pump, analogous in construction to the water-circulating pump. The Mors system of change-speed gear, in which the power is transmitted through one or other of two bevel gears to the differential shaft, is still retained, four speeds and a reverse being provided. The clutch, an illustration of which has already been given in these pages, is of a new metal-to-metal type, consisting of two shoes contracting on an internal flange on the fly-wheel. The brakes are three in number; on the 45-h.p. car there are two hand-brakes on the differential counter-shaft, operated by separate pedals, one of which is so connected up that the counter-shaft brake is first applied, further depression of the pedal bringing the rear hub-brakes into operation. The cars on view include a 28-h.p. chassis, a 28-36-h.p. vehicle with a handsome limousine body, and a 17-23-h.p. double landaulet for town use, the engine in this car being located under the driver's seat. An illustration of the Mors 17-23-h.p. landaulet is given in Fig. 18.

#### The Aries Cars.

Considerable interest is being shown in Aries cars, which are now being introduced into this country by a new concern known as ARIES, LIMITED. Several sizes are made, ranging from 12-14 h.p. double

case can be readily removed to enable any adjustments to be quickly carried out. Both magneto and accumulator ignition are provided and the water circulation is maintained by a gear-driven pump, a spring being introduced in the drive to prevent any strain on the pump. The radiator of a distinctive circular form is employed. The clutch, of which a sectional view is given in Fig. 19, is of the disc

Fig. 19.—Sectional View of Aries Clutch.

A. Engine Shaft. B. Clutch Shaft. R. Clutch Spring.

type, working in oil. The transmission is by cardan shaft and bevel gear on to a live axle. The latter is of special design and was illustrated in the *M.C.J.* of January 6th last. A fixed axle is provided below the live axle to support the differential case and render it rigid. The shafts from each side of the differential run through the hollow trunnions

Fig. 20.—Sectional Elevation of Chassis of Aries 35-h.p. Car.

cylinder to a 50-h.p. four-cylinder, the chassis on view (Fig. 20) being of the 35-h.p. model. While following standard practice, the cars appear to be of high-grade construction, and have certain special features of their own. The frames are of pressed steel, with a separate underframe to carry the engine and gear-box. The engine comprises four separate cylinders, with mechanically-operated inlet valves and automatic carburettor. A separate bearing is provided between each throw of the crank shaft and the bottom half of the crank

at the ends of the dropped fixed axle on which the road wheels are mounted on balls, the drive to the wheels being through a star dog clutch on the end of the rotating shaft. The differential shaft has thus only to transmit the power without carrying any of the weight of the car. We may add that ball bearings are employed throughout, except on the engine. The Aries cars have already earned an excellent reputation in France, and now they are being introduced into England, we expect to see them equally as popular at no distant date.

**The Gregoire Cars.**

Messrs. OSBORN AND LORD are exhibiting two new models of the Gregoire cars, both fitted with cardan shaft transmission. Dealing first with the 8-h.p. vehicle, the chassis has a pressed steel frame and a double-cylinder engine (80 mm. bore by 110 mm. stroke). The valves are all mechanically actuated off a single cam shaft. The radiator, which is carried in front of the bonnet, is of the framed ribbed-pipe type and the water is circulated on the thermo-syphon system, a fan being formed in the flywheel. Both high-tension magneto and accumulator ignition are provided, a two-way switch being attached to the dashboard, as are also sight-feed lubricators leading to the engine. The change-speed gear mechanism provides three speeds and a reverse, with direct drive on top speed. The transmission is through a large diameter clutch, universal joint, gear-box, and cardan shaft to the rear live axle. In view of its relatively low price the 8-h.p. Gregoire is rapidly becoming a popular type, and the complete car with special two-seated body and hood is well worthy of inspection. In addition to the 8-h.p. car, Messrs. Osborn and Lord are also showing a 15-h.p. four-cylinder car (Fig. 21). In general arrangement the vehicle is on similar lines and possesses the features of the smaller yet older production. The various parts are, of course, of larger proportions, to correspond to the higher power. The engine comprises four cylinders, 80 mm. bore by 110 mm. stroke; the valves are all mechanically actuated off one cam shaft. The base chamber is fitted with inspection plates for the easy examination and adjustment of the connecting rod brasses. The mixture is furnished by a Longuemare carburettor, with automatic air inlet. Two ignitions are fitted, viz., Basse-Michel high-tension magneto, and ordinary coil and accumulators. Cooling is on the thermo-syphon system, large supply pipes being employed. The engine

Fig. 21.—Chassis of Gregoire 15-h.p. 4-cylinder Car.

is protected by a metal shield under the frame, which prevents any dust or mud from getting into the mechanism, and which, at the same time, assists the flywheel fan in inducing a current of cold air through the radiator. As in the 8-h.p. model, three speeds forward and a reverse with direct drive on top speed are provided, the transmission being by a cardan shaft and bevel gear to a strong live axle. We may add that in both types ball bearings of the D.W.F. type are employed on all the shafts except those of the engine, and that the control of the engine is by means of levers mounted on the steering wheel.

**The Hurst Car.**

Mr. GEO. HURST, of Holloway, N., who has been building cars for some years, exhibits the well-finished 15-18-h.p. car illustrated in Fig. 22. The vehicle is constructed throughout on modern lines, having a pressed steel frame and a sufficiently long wheel base to take a roomy side-entrance body. The engine comprises four separate cylinders, 4 in. bore by 4 in. stroke, having the valves arranged on opposite sides and mechanically actuated by separate cam shafts. The water circulation is maintained by a valveless pump and a special form of radiator. The latter is built of a series of thin flat tubes set in a frame which also forms the water tank. Ignition is by coil and accumulators, although a high-tension magneto can be provided. The transmission is through a leather-faced cone clutch, gear-box, cardan shaft, and bevel gear, to a well-stayed live axle. The change-speed gear is adapted to give three speeds and a reverse with a direct drive on top. The brakes are of the double acting contracting type, provision being made to allow any adjustments to be easily effected. Mr. Hurst is also building a 30-h.p. six-cylinder car, the engine of which has separate cylinders, 4 in. bore by 4½ in. stroke.

**The Critchley-Norris 'Bus.**

The CRITCHLEY-NORRIS MOTOR COMPANY make their debut with a 40-h.p. chassis specially designed for use as a motor-'bus, and which is attracting considerable attention among public-service engineers. As, however, a full description of the vehicle is concluded in another part of the current issue no further reference is here necessary.

**The Jackson Dogcarts.**

Messrs. REYNOLD JACKSON AND CO. are present with several of their deservedly-popular Jackson dogcarts, the reasonable price of which has brought them many clients. The 6-h.p. vehicle, which is fitted with a De Dion engine, is supplied with either two or three

Fig. 22.—The Hurst 15-18-h.p. Car.

forward speeds, in addition to the reverse. It has been improved in many of the details, among which may be mentioned the fitting of a framed ribbed-pipe radiator, which dispenses with the use of a separate water tank. The 9-h.p. car (Fig. 23) is an elegantly-finished vehicle.

It has a pressed steel frame and a heavier axle than heretofore. Three speeds forward and the usual reverse are provided. As in the 6-h.p. car, a combined radiator and tank is now employed. A similar car, but fitted with a Peugeot-Huber horse-power twin-cylinder engine, is also shown. The body is of the standard Jackson dogcart type, the rear seat being reversible, so that all passengers may face forward, the entrance to the back being then through a hinged front seat. Considerable interest is being shown in the chassis of the little Jackson car which has travelled over 15,000 miles at an extremely low cost of upkeep.

**Non-skids.**

The GLASGOW MOTOR TYRE COMPANY, LIMITED, have made great progress since their detachable non-skid and puncture-proof band was introduced to the motoring public, and will shortly occupy new works well equipped to deal with the orders in hand. The band itself can be detached and attached in three minutes; while by bringing the clip in different position over the weak portions of the sides or the walls of the cover the band acts as a gaiter. When in service the band does not heat the tyre, and it is light enough to be used without retarding the speed of the car. The company have abandoned the use of leather in connection with the bands, which are now made of fabric capable of withstanding a pressure of 6,000 lbs. to the square inch. This is claimed to be immune against stretching and water, while its wearing capabilities are exceptional. The studs on the non-skid are made of case-hardened

Fig. 23.—The Jackson 9-h.p. Dog Cart.

steel, and the general work of the Glasgow Motor Tyre Company is of a good class. They are experts in dealing with old covers, and we have seen specimens of excellent work in rebuilding these from the foundation with square, grooved, or round treads.

**The 1906 Star Cars.**

A large range of the well-known Star cars are exhibited by the STAR ENGINEERING COMPANY, including a chassis of the 7-h.p. double-cylinder car, a three-seated 7-h.p. vehicle, one of similar power with a special Victoria body with hood and front glass, for doctor's use, fitted with hood and glass screen (Fig. 25). As this vehicle has already been described in the *M.C.J.*, it is only necessary to mention that the engine, Fig. 24, comprises two vertical cylinders, which are  $3\frac{1}{2}$  in. bore by 4 in. stroke, and that a governor with foot accelerator is provided. Three speeds forward and a reverse are available, the power being conveyed

Fig. 24.—Sectional view of Star 7-h.p. Twin-cylinder Engine.

to the rear road wheels by side chains. Among the improvements for the 1906 season may be mentioned the fitting of the steering bar behind the axle, rear springs outside the chassis, and a longer wheel base. The next model is the 10-h.p. four-cylinder car fitted with a double phaeton body, access to the rear seats being through a swinging front seat. The cylinders are 3 in. bore by 4 in. stroke. Three speeds forward and a reverse are provided. The car is on modern lines throughout, and its relatively low price is rendering it a popular type.

Fig. 25.—The Star 7-h.p. Victoria.

Interest in the examples of the 14-h.p. Star cars on view is increased by the fact that this is the type selected by the A.C.G.B.I. for use in teaching members to drive. The design of the vehicle is on modern lines throughout, the frame being of pressed steel. The engine comprises four-cylinders,  $3\frac{1}{2}$  in. bore by 4 in. stroke; it is on similar lines to that in the 10-h.p. car, the inlet valves being mechanically actuated and located in the cylinder heads. The carburettor is of the automatic air regulation variety, and the control of the engine is by a variable lift of the inlet valves. Ignition is by coil and accumulators, and the water circulation by pump and honeycomb radiator with fan. The gear-box, the

hafts of which run on ball bearings, is adapted to give three speeds and a reverse, and direct drive on top speed. The wheel base of the car is 8 ft., enabling a roomy double phaeton side-entrance body to be fitted.

**The "Newmobile" Car.**

A new light vehicle, comprising a number of interesting features, is exhibited by the NEWMOBILE CAR COMPANY. The chassis on view is

Fig. 26.—Sectional View of Newmobile Combined Clutch and Change Speed Gear.

intended to be fitted with a van body capable of carrying a load of 10 cwt., but it is also being built with a small coupé or landaulet body for the use of professional men. The motive power is supplied by a 9-h.p. engine, built up with which so as to form a single unit is the clutch and change-speed gear, so that there is no danger of the latter getting out of align-

Fig. 27.—The Newmobile Combined Engine, Clutch, and Change Speed Gear.

ment with the motor. Fig. 26 gives a sectional view of the Newmobile combined clutch and change-speed gear, which is adapted to give two speeds and a reverse. The object of the inventor has been to obtain a change of the forward speed gears without sliding spur wheels, by means of metal-to-metal coned clutches. Referring to the illustration, A is the gear-box, which at the left side is bolted rigidly to the engine

crank case; B is an extension of the crank shaft. Mounted rigidly on this is the metal clutch D, which can revolve, but has no fore and aft movement. On the shaft B is also mounted the spur-wheel E, with 28 teeth. At T is shown an extension of the half-time shaft, and upon this is rigidly mounted the spur-wheel F, with 56 teeth, meshing with the pinion E. To the right of the shaft T is fixed upon a squared portion a spur-wheel J, having 38 teeth, which meshes with the pinion K, with 46 teeth. The latter wheel is attached to the clutch L, which can freely revolve around the shaft H. It forms the important member of the group, and can revolve freely round the shaft B upon the bushing B H, whilst at the extreme right it carries the universal joint R, from whence the power is conveyed to the cardan shaft and so to the rear live axle. The central clutch G is carried by a disc machined upon the shaft H, and can be given a fore-and-aft movement by means of the rack N. P is a spur wheel rigidly attached to the turret thread rack N, the teeth of the latter moving in a casing M, which is rigidly screwed to the main oil-tight

sequently the collar C H being rigid with the shaft H, it is also moved to the right, taking with it the clutch G, which then engages with clutch L. The movement from the engine is now from B to clutch D, thence to spur-wheel E, which, meshing with F, drives shaft T. J, being rigid on shaft T, is revolved, and, meshing with spur-wheel K compels the attached clutch L also to move. The latter being in engagement with the central clutch G, and the latter being fast on the shaft H, the engine speed is thus geared down to reach the universal joint R. The three clutches D, G and L are all metal-to-metal, and as the casing A is oil-tight, a film of oil is interposed between the clutch surfaces to take up the shock of engagement, the oil being gradually forced away by holes taken through the peripheries of D and L. All adjustment can be made from the outside of the case, without dismantling the gear. By means of a spring upon the heel pedal, which works on the arm S, it is impossible to leave the reverse wheels in gear after the foot has been taken off the pedal. We understand that the gear has been subjected to extensive trial ere being put on the market. Although from the

Fig. 28 and 29.—Elevation and Plan of Frick Single-Deck Friction-driven 'Bus.

casing A. To the right of, and above the shaft T is an arm S which projects through the casing A and is attached to the reverse pedal. The inner arm of S engages with the spur-wheel J by means of a collar upon the latter, and as the shaft T at this portion is squared, J can be slid along to mesh with two other spur wheels (not shown) to obtain the reverse by means of the spur-wheel K and the clutch L. We can now proceed to describe the action of the mechanism. On the high gear the four spur-wheels E, F, J and K revolve idly. By a suitable lever below the steering wheel, the shaft N S is pushed along, its rack engaging the teeth of the spur-wheel P and causing this to revolve. As P is rigidly attached to N, this also is revolved, but having its turret thread meshing with similar teeth on the fixed casing M it is compelled to move to the left when revolved, and pushes the ball thrust B C against the shoulder of the shaft H at H S, and therefore pushes the shaft H to the left, carrying with it the central clutch G. The latter is now in engagement with the clutch D, and on the high gear the motion is from B, through the clutch D to clutch G, thence to shaft H, and so to the universal joint R. For the bottom gear the shaft N S is pulled out and the rack N moves to the right against the ball thrust B D and collar C H, con-

description it may appear somewhat complicated, it is really of a simple character, both the clutch and change-speed being operated by a single handle on the steering column.

#### The Frick Vehicles.

MESSRS. DOUGILL'S ENGINEERING, LIMITED, exhibit a single-deck omnibus, one of four constructed to the order of the Bromley and District Motor Omnibus Service, of which we give a plan and elevation in Figs. 28 and 29. It is fitted with a three-cylinder engine, the bore and stroke being respectively 5½ in. and 6 in., developing 20-h.p. at 800 revolutions. Automatic inlet valves are employed, with accumulator ignition. The radiator is a tubular honeycomb, and a centrifugal circulating pump is fitted, although the water would circulate naturally by thermo-syphon should the pump be disabled. There are bearings between each cylinder, the connecting rods and crankshaft being of special nickel steel, and the bushes of phosphor-bronze. The carburettor is automatic with gravity feed. The transmission is by means of the "Frick" variable friction gear, with which any variation of speed can be obtained by moving a leather-edged wheel at right angles to a large

diameter friction disc. When the driven wheel is at the centre of the disc no motion is imparted, but as it is moved out towards the periphery its speed is gradually increased. Another wheel revolves idly on the same shaft, to balance the pressure of the driven wheel, and an idle disc is pressed up on the opposite side of these two wheels, so as to impart sufficient driving pressure without loading the bearings of the driven shaft. Visitors interested in commercial vehicles would do well to examine this drive with care, as it has great possibilities, and entirely eliminates the clutch, gear, and bevel drive. There is a positive drive from

of the dustless Spyker cars, which are receiving a good share of public attention. Pride of place is given to a 20-28-h.p. chassis (Fig. 30) which is mounted on a slowly-rotating turn-table. It is provided with the novel frame and pedals illustrated in our issue of the 9th December last, but a still further new departure is seen in the adoption of three-point suspension both for the engine and the gear-box. The motor comprises four cylinders, 110 mm. bore by 120 mm. stroke. Dual ignition is provided, while the water-circulating pump is located in such a way that it is readily accessible. A feature of the radiator is that it is sup-

Fig. 30.—Chassis of Spyker 20 28 h.p. Dustless Car.

the friction disc to the driven wheel, and an auxiliary drive through the idle wheel and idle disc to the further side of the driven wheel, so that slip is almost impossible. The reverse is obtained by moving the driven wheel across the centre of the friction disc, thus reversing the direction of rotation. The drive is taken from the friction countershaft by roller chain to an intermediate shaft, the function of which is only to break the great length of chain that would otherwise be required. Thence the drive is by another roller chain to a live back axle. The frames are of H section, 4 in. deep by 2 in. wide,

ported on the frame through ball joints, so that it retains its position independently of any movement of the frame due to jolting or other causes. In this way the liability of leaks arising in the radiator is considerably reduced. The transmission is on the usual lines of bevel gear-driven cars, a notable feature being the ease with which access is had to the gear-box. Other Spyker cars exhibited on the stand comprise a 16-24-h.p. car and a 14-18-h.p. chassis; the engine of the latter is provided with a ball-bearing crank shaft. We note, too, that the motor control levers are not fixed on the steering wheel, so that they do not

Fig. 31.—Chassis of Turgan 40-h.p. Motor 'Bus.

and all wheels are of equal diameter, 3 ft. 3 in. The body has been built by Goode, of Highbury, and will carry sixteen passengers inside, and the whole of the roof is railed for luggage and parcels. There is, in addition, a special luggage carrier that folds up underneath the body. The firm also manufacture delivery vans and pleasure cars with the same system of gearless drive.

**The Spyker and B.A.C.S. Cars.**

The BRITISH AUTOMOBILE COMMERCIAL SYNDICATE have an exceedingly attractive and novel stand, on which is shown a full range

move with the latter. Reference may also be made to the 20-28-h.p. Spyker fitted with special six-seated landaulet body by Meier, of Redhill, built to the order of Mr. E. N. Casares. Finally we may mention a 28-h.p. B.A.C.S. car with landaulet body; this vehicle, which is on Mercedes lines, has already been illustrated in the *M.C.J.*

**The Turgan Commercial Vehicles.**

ETABLISSEMENTS TURGAN, LIMITED, exhibit an omnibus chassis and a two-ton lorry. They are both of particularly solid construction and appearance, as the previous productions of M. Turgan would lead us to

expect. The frame channels on the 'bus chassis (Fig. 31) have been stiffened by an additional pair of channels inside the frame, to which they are attached by a stiff top plate. These stiffening members extend from the clutch to the gear-box, so that there is no possibility of the frame sagging after six months' use, as has been the case with some designs. This chassis is fitted with a four-cylinder engine having separate cylinders 120 mm. diameter by 150 mm. stroke, developing 40 brake h.p. at 830 revolutions per minute. The inlet and exhaust valves are on opposite sides, operated by separate cam-shafts, and the ignition is by accumulator and coil. High tension magneto can be fitted if required. The crank shaft has a bearing

Fig. 32.—View of Chassis of Brasier 25-36-h.p. Chain-driven Car.

between each crank, five in all. The water jacket has been extended much lower on the cylinder castings than usual, and extra large water pipes are employed to ensure efficient circulation. The radiator has horizontal gilled tubes, and a positive pump is fitted. The only fan is that in the fly-wheel, both male and female portions of the clutch being cast with fan vanes. A Tourand carburettor, with pressure feed, furnishes the mixture. A large diameter leather-faced cone clutch is employed to transmit the drive to a long double-jointed propeller shaft. The gear-box, which is cast in gun metal, contains the speed gear, bevel drive, and differential. Four forward speeds are provided, operated by a single lever, the top speed being a direct drive by a dog clutch, the other speeds being by sliding gears on the Panhard system. The reverse is applied by the same lever through a gate quadrant. A flexible differential countershaft is employed, the central portions being carried by the gear-box, and the end portions, which have the chain sprockets attached, are supported with long bearings bolted to the frame channels, and loose couplings are introduced to obviate any risk of injury from temporary want of alignment. The final drive is by Renold silent chains to sprockets on the back wheels. There is a very neat and effective arrangement for locking the differential should it be necessary. The back axle is a solid forging 3 in. by 3½ in. deep, and the back springs are 3 ft. 8 in. long. A pedal operates a duplex band brake acting on both sides of the differential countershaft, and the hand lever operates Lemoine band brakes on the driving wheel hubs. Both sets of brakes are compensated. The exhibition chassis is fitted with cast steel wheels, but wooden wheels can be supplied if specified. The whole chassis is worthy of very careful attention on account of its strength, simplicity, and the care bestowed on the details. The two-ton delivery van is fitted with an engine having four cylinders 110 mm. diameter by 130 mm. stroke developing 25-h.p. at 800 revolutions. In details it is

of the latter being fitted with a handsome limousine body. The 25-36-h.p. chassis (Fig. 32) on view illustrates the very latest production of the Brasier Company, the transmission being by side chains. As has been previously mentioned, the crankshafts of the engine are slightly offset from the centre of the cylinders. The magneto ignition gear is also on special lines. A Brasier car having won the Gordon Bennett race twice in succession, they naturally loom largely in the eyes of the motoring public, and this week is no exception to the rule. Turning now to the Unic cars which are made by Messrs. Georges Richard and Co., two sizes of vehicle are being turned out, 12-h.p. and 16-h.p. The former has already been dealt with in these columns, so that it need only be mentioned that the 1906 model shows but few changes. The engine dimensions are slightly larger, but otherwise the alterations are confined to matters of detail. The Unic 16-h.p. four-cylinder car (Fig. 33) is an entirely new model, for which there should be a large demand. The pressed steel frame is made in two lengths, one being intended to receive landaulet and large limousine side-entrance bodies. The cylinders are 87 mm. bore by 110 mm. stroke, and are cast in two pairs. The valves are mechanically actuated, the ignition is by low tension magneto, and the water circulation by pump and honeycomb radiator, blades being fixed on the periphery of the flywheel to act as a fan. The gear-box is adapted to give three or four forward speeds as desired, in addition to the reverse; the transmission is by a cardan shaft and bevel gear to a well-supported live axle.

#### The Thames Motor Coach and Steam Wagon.

The THAMES ENGINEERING WORKS are exhibiting a motor coach, built to the order and design of the London and South Coast Motor Service, Limited, for summer traffic between London and Folkestone, Brighton, Hastings, etc. It is fitted with a six-cylinder engine, having separate cylinders 4 in. diameter by 6 in. stroke, the valves being on opposite sides, with two cam shafts. High-tension ignition is employed, from accumulators and coil. The crank shaft has a bearing between each

Fig. 34.—The Thames Engineering Works 45-h.p. Six-Cylinder Motor Coach.

cylinder, seven in all, and a positive pump is fitted. The radiator consists of horizontal gilled tubes, and no fan is employed. The carburettor is a special feature, as it was found in the trials that an equal mixture could not be obtained in all six cylinders with an ordinary carburettor, so a new type had to be designed, which is now found to fulfil all requirements. In the centre is a common float chamber from which the petrol vapour is passed in opposite directions through passages jacketed with water from the cylinder jacket. These passages lead to two automatic carburettors, where the mixture takes place, and immediately above each of these is a throttle valve. From the throttles the mixture is led to three branches supplying the three cylinders at either end. The two throttles are connected up to one another, and to the governor at one end, and the accelerator pedal at the other end. The engine develops 30 h.p. at 750 revolutions, and 45 h.p. at 1,000 revolutions. A leather faced cone clutch is used, and the gear-box provides four forward speeds and a reverse, the direct drive being on the top speed. The gears are changed by a single lever on the gate system. From the differential countershaft the final drive is by roller chains. All the wheels are unusually large, the steering wheels being 3 ft. 3 in. diameter and the driving wheels 4 ft. 4 in. A spring pull bar, similar to that on the Straker-Squire 'buses, transmits the pull from the back wheels to the frame, and saves the vehicle from sudden shocks. All the details have been carefully thought out (as, for instance, rubber pads to the spring hangers), so as to make the most luxurious travelling. The body has three transverse seats immediately behind the driver, to seat four each, and a closed back part with seats at the sides, to hold eight, making a total, with two beside the driver, of twenty-two. All the seats are

Fig. 33.—The "Unic" 16-h.p. Four-Cylinder Car.

similar to the omnibus except that a belt-driven fan is provided, and roller chains are used for the final drive. A simple body with low sides is fitted to the lorry shown, but any type of body can be supplied.

#### The Brasier and Unic Cars.

MESSRS. MANN AND OVERTON'S, LIMITED, make an imposing display of the Brasier and Unic cars, for which they are British agents. The Brasier vehicles have so recently been described at length in the *M.C.J.* that it need only be mentioned that the cars on view include examples of the 12-16-h.p., 16-30-h.p., and 25-36-h.p. types, one

cushioned with morocco. This firm also exhibit a standard six-ton steam wagon, with a locomotive type boiler, and a compound horizontal engine, slung transversely under the body. This position requires a right-angled turn in the drive, as in the case of most petrol vehicles, so that after passing through the reducing gear, with fast and slow speeds, there is a cardan shaft leading to the back axle, where the differential is driven by a bevel pinion and spur wheel. Long back springs are used with short supplementary springs above them, which come into action when the main springs are depressed several inches. The front springs bear on a rocking fore-carriage, pivoted so as to give three-point suspension to the vehicle. The wagon is very powerful, and can haul a large trailer load in addition to the six tons on deck.

#### The Jackson Omnibus Chassis.

Messrs. R. REYNOLD JACKSON AND CO., LIMITED, exhibit a chassis designed for a thirty-four passenger omnibus. It is fitted with a 25-30-h.p. four-cylinder engine, designed to run at 750 revolutions, the cylinders being 110 mm. diameter by 120 mm. stroke, cast in pairs. The valves are mechanically operated, and are all on one side of the engine, worked off a single cam-shaft. Accumulator ignition is fitted, and the centrifugal pump is driven off the cam-shaft by spiral gearing. The radiator is built up of horizontal tubes threaded through upright plates, and is cooled

to take full advantage of the heavy motor-car Order, and this firm took the opportunity to enclose the whole of the motion work and gearing in a dust-proof and oil-tight casing. The special form of double-ended loco-type boiler which is the characteristic feature of these wagons remains unaltered, except in dimensions. The engine is compound, with cylinders 4½ in. and 7½ in. diameter by 7½ in. stroke, and single eccentric reversing gear is employed. The position of the cylinders, which used to be outside the frame, has been slightly altered, so that they are now immediately below the channels, but are still quite as accessible. The transmission is entirely by machine-cut cast-steel spur gearing to a live axle, made of the best Yorkshire iron. This hind axle is carried in spherical sliding bearings, so designed that the gearing is not affected by the give of the springs. Two speeds are provided, which can be changed from the driver's seat. A pump, driven from the second motion shaft, is inside the oil bath, with the end of the barrel and the valves projecting outside, and maintains the water level in the boiler by a by-pass cock, an injector being also provided for emergencies. The oil is circulated to every bearing by a force pump, and, owing to the form of bath adopted, the consumption of lubricating oil has been reduced to a minimum. Stagg's patent pocket hubs are used in the wheels, with wooden spokes and felloes, and gas-welded steel tyres. The front wheels

Fig. 35 and 36.—Elevation and Plan of Chassis of Jackson 24-30-h.p. Motor-Bus.

by a fan driven by a belt from the crank-shaft. A leather-faced cone clutch is fitted, and sliding gears, providing three forward speeds and a reverse, with a direct drive on the top speed. The unusual type of cardan shaft at once catches the eye, square boxes on either end fitting over square dies on the fixed shafts. The differential countershaft is fully encased, and carries sprockets at each end, from which the drive is taken by roller chains to the large sprockets, bolted to the spokes of the back wheel. A pressed steel frame is employed, 6 in. deep at the central portion, braced together by pressed steel channels where required. A very large steering wheel is fitted, probably necessitated by the 9 in. from the centre of the steering wheel to the pivot. The attachment of the steering arm to the top of the gudgeon fork is somewhat remarkable, and the coupling rod is at the back of the front axle. The pedal brakes are on the gear-box shaft, and on the rigid length immediately in front of the differential casing, and are not compensated. The hand lever works two band brakes on the back wheel hubs, and these also are uncompensated. The chassis is very simple, and the price asked is much more reasonable than that usually asked for such vehicles. The firm are prepared to give very early delivery.

#### The Yorkshire Steam Wagon.

The vehicle exhibited by the YORKSHIRE STEAM WAGON COMPANY is one of their improved enclosed type. Some alterations were necessary

are 3 ft. diameter by 5 in. wide, and the back are 3 ft. 3 in. diameter by 10½ in. in width. The front axle is a rectangular steel forging 2½ in. by 3½ in., the ends oscillating between horn plates, and carrying the front end of the frame at the buckle of a cross laminated spring, thus ensuring three-point suspension. The wagon exhibited is intended to carry five tons, and to pull another two tons on a trailer. The body, built of well-seasoned timber, is designed to discharge by tipping, two long vertical screws being operated from either side by bevel gearing. It is built to the order of Messrs. Fry Brothers, of Greenwich, and is the third Yorkshire wagon delivered to them.

#### Motor Clothing.

MESSRS. CHAS. BAKER AND CO.'S STORES, LIMITED, make a capital first appearance at automobile exhibitions with a display of high-class motor clothing for both ladies and gentlemen, as well as liveries for chauffeurs. Their waterproof motor overcoats are made in tweed, frieze or cheviot, the dust and rain coats being in Venetians and fancy tweeds. For the convenience of ladies the firm always keep a selection of dust coats and waterproofs, as well as caps and veils, the latter being of a very fashionable design. Motor caps, boots and shoes, leggings, gloves, and travelling rugs make up a very attractive display.

(To be continued).

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, W.C.]

### CALCULATING POWER OF PETROL ENGINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Messrs. Dean and Burden's method of calculating horse power seems to work out fairly right, but I shall be glad if you will inform me, through the *M.C.J.*, if the form is equally correct for two-cycle engines, and if I am right in supposing that a single cylinder two-cycle engine at 500 r.p.m. would give 500 impulses.—Yours truly,

R. HANNEN.

[The method of calculating horse power formula given by Messrs. Dean and Burden Bros. will not apply to a two-cycle engine.]

### A USEFUL FITTING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am sending you a photo of a little device I have fitted to my car, as I thought it might be of interest to the readers of the *M.C.J.*

Referring to the illustration, you will see a small mirror fixed on the wind screen, which enables the driver to see at the back when driving. The device is especially useful when turning to the off-side of the road.—Yours truly,

H. HUNT.

### TWO-CYCLE PETROL ENGINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A good deal of attention is now being devoted to the subject of internal combustion engines working on a two-stroke cycle. I have been greatly interested in the question for six years, and I think I have found a solution of some of the difficulties which confront us in designing such an engine. With your permission, I will make public my ideas, and, in order to encourage experiment on the lines suggested, I wish to make it known that I shall not make any use whatever of the patents I hold in England and France, except to prevent others acquiring protection, and thereby possibly injuring the industry.

I contend that if an engine be made with a cylinder closed at both ends, and provided with a hollow piston, the charge of gas may be drawn in at the end of the cylinder which contains the stuffing-box, compressed by the next stroke, and forced into the piston, carried to the other end of the cylinder inside the piston, released there and fired. The result will be that every downward stroke of the piston will be a firing stroke and also a compression stroke, whilst every up stroke will perform three functions in exhausting the cylinder, sucking in a fresh charge, and carrying a compressed charge within the piston. Every one of these operations is performed by an absolutely full stroke of the piston. The gases inside the piston will, after one or two strokes, attain such a pressure that exactly one charge will be released for firing at the top of every stroke. Should the charge fire back into the piston, it can exert no back pressure; in fact, it might be found advantageous to fire it there.

I think the following would be the advantages of making an engine on this principle. 1. There is no residue of exhaust gases at the commencement of the suction stroke, and an absolutely full charge is therefore drawn in. 2. The charge is drawn into the cool end of the cylinder, and is not rarefied by the heat. 3. An explosion every stroke. 4. Whilst being carried within the piston, the charge increases in compression owing to the heat of the piston and cylinder walls, without back pressure. Thus the waste heat is used to gain further power. 5. The inlet valve and the valve in the under side of the piston are not subjected to the explosion pressure and temperature (the releasing of the gases into the explosion chamber can be done by means of simple ports). 6. The compression is directly deducted from the explosion, and acts as a buffer to stop the reciprocating parts. 7. The crank shaft and connecting rod bearings are always under thrust. 8. There is no necessity for a heavy flywheel, and the engine would run and develop power at any speed, however slow, since the pressure has only to be returned against the slight pressure of the exhaust gases and of the suction. 9. The engine would probably not require water cooling, owing to the fact that there would be little rarefaction of the charge even at high temperatures. If provision were made for cutting off the fuel supply (which might be injected direct into the firing chamber, and controlled by a hit-and-miss governor) the engine would develop some power as a hot air engine, whilst air-cooling itself.

Personally I have not the time or the money to carry out extensive experiments, and I do not think I ought to stand in the way of others doing so. I shall therefore be pleased to grant licences to anyone working on the lines I have suggested in the two countries I have named, free, if they do not think the abandonments of the patents declared in this letter sufficient. The patents referred to are No. 341559 of 1904 in France, and No. 7932 of 1903 in England.—Yours truly,

WILLIAM E. CLIFTON.

### PROGRESSIVE GEARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As regards the use of cone drums for above (belt driven) it occurred to me that the desideratum was a contrivance to prevent the belt slipping, and operated at will by the driver. Having put my idea of effecting this in the practical form of a model, I should be pleased to show or describe it to anyone interested.

In a few words I might say that the tightener consists of a pivoted frame with end rollers through which the belt passes, and these rollers, by a turning movement of the frame, bear against the sides of the belt, guiding it toward the larger circumferences of the drums.—Yours truly,

H. H.

### DOES LOW TENSION MAGNETO IGNITION GIVE GREATER POWER THAN HIGH TENSION?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was interested in the letter appearing in the last issue under the *nom de plume* of "Worthing," as to whether low tension magneto ignition gave greater power than high tension. We have made a number of experiments on Crossley engines with these two ignitions, and there is no doubt but that the engine is much more powerful with low tension magneto. Of course, there is an external range on the ignition—almost as great a range, in fact, as any system of high tension ignition, but there is no question but that we have got better all round results from a power point of view with low tension ignition than with high.—Yours truly,

CHAS. JARROTT.

### THREE-CYLINDER ENGINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Such a trial as Mr. Lamb now suggests I do not think necessary, as both the four-cylinder and three-cylinder motors have been on the market for a sufficient length of time to enable the public and manufacturers to already decide the question. I think I am right in saying that my firm was the first to commercially construct three-cylinder motors in this country, and were followed at a later date by the Standard Motor Company, and then by Panhards. Now, it is a curious thing, presuming that three cylinders are better than four, that both Messrs. Brooke and Co. and the Standard Motor Company should have abandoned them in favour of four.—Yours truly,

MAWDSLEY BROOKE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Interested," the vibration or pendulum motion of a three-cylinder engine is not confined to the vertical type. The motion is set up and conveyed to the frame in either case. With a horizontal motor set transversely, however, the vibration is across the frame instead of along the centre as with a vertical engine. I notice that the manufacturers who write in support of three-cylinder engines do not seem to have had any experience of four or six cylinder types, and content themselves with the assertion that their

engines do not vibrate. I am quite satisfied that they believe what they say, and also that as soon as they start making four or six cylinder engines they will drop the three-cylinder. Several have done so already and the remainder will inevitably follow.—Yours truly,  
R. W. MAUDSLAY.

### MORE ENGINE TROUBLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—When my car is at rest, with the motor, which has four cylinders, running as slow as possible—about 250 revolutions per minute, on pulling the throttle open any additional amount the engine will slow down before speeding up. If the throttle is pulled open quickly the motor will stop entirely. The carburettor is the so-called automatic type, with a separate air valve held closed by a light spring. I should be glad if you or any reader of the *M.C.J.* could assist me in locating the cause of the trouble.—Yours truly,

XENOPHON.

[It is very difficult to determine the cause of this trouble, as "Xenophon" does not state the type of carburettor fitted to his car. It would appear, however, from the symptoms given that the air valve

is too low for the capacity; possibly they may be charging at 1 ampere for eight hours which is obviously not sufficient, so that the plates are never fully charged, and the accumulator soon runs down. Unless "Forwards" can get them charged at the above rate, it would be better to employ four cells of a primary battery, as cells of the types mentioned will easily give three amperes if the voltage is kept up, and by the use of four cells for the primary this can be done. It should be remembered, when charging from a primary, that the current in the circuit is produced by the difference in the voltage between the accumulator and the battery, so that it is necessary to keep the charging voltage of the primary at least two volts above that of the accumulator.]

### BROKEN CYLINDER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should feel obliged if you or some kind correspondent could inform me the probable cause of my cylinders breaking. I have had two cylinder heads broken within twelve months; the car is a 6-h.p. single cylinder Regal; in both cases they broke just above the flange that bolts them on to the crank chamber; the fractures were

Touring in Egypt. A Motoring Party at the Pyramids.

requires a slightly stronger spring to prevent too much air passing in upon opening the throttle.]

### IGNITION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have had a good deal of trouble with the ignition of my 6-h.p. Baby Peugeot owing to the fusing of the platins of the make and break. I have put in a new coil without benefit, and suspect that the charging of the Dinin accumulator of 40 ampere hours capacity is at fault. Could you give me any advice, or could you inform me whether it would be better to charge my accumulators by means of Fuller's cells or the Boron battery?—Yours truly,

FORWARDS.

[If the trouble is caused by the accumulators, it would be advisable to make certain that they are in proper order before trying charging by primary battery, as this is a somewhat expensive method to employ. First ascertain if the dilute acid in the cells is at the right strength, namely, a specific gravity of 1.200 when charged. If it is lower than this more acid must be added to make it correct. Then have the accumulator well charged, making sure that it is charged at the rate of 3 amperes for twelve hours. When fully charged it should give  $4\frac{1}{2}$  volts on a reliable voltmeter. Accumulators of 40 ampere hours capacity are often under-charged owing to want of thought, or they are charged at a rate which

irregular. They were both genuine De Dion heads, and the four bolts that hold the heads to crank chamber were screwed tight down. Would a back fire do this mischief?—Yours truly,

U. C. T.

[The only probable cause of this trouble we can suggest is that the top of the crank case has by some means become out of truth, and does not present a flat face for the cylinder to bolt down on. This, in combination with the explosions and the bolts being tight, would in all probability cause the trouble. A back fire would not in any way do this.]

### OVERHEATING OF INDUCTION COIL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am using an induction coil of good make on my car, but it gets so hot that the paraffin has melted and run out to some extent. I do not know how coils are constructed, and consequently do not know what to do to stop it. Will it do any harm? It does not seem to make any difference with the sparking as yet, but shall be glad if you or any reader of the *M.C.J.* can tell me how to prevent the heating.—Yours truly,

W. R. L.

[The trouble caused by heating in the induction coil may be due to "W. R. L." using a battery of higher voltage than is suitable, or

that the induction coil is placed too near some part of the car which gets heated. It is also possible that there is a short circuit in part of the primary winding, causing too much current to pass through it. It will not do any harm until the paraffin has melted completely off some part of the condenser or secondary winding, so that moisture can get to it, which would eventually happen. If one end of the coil is unscrewed and lifted so that the connecting wires to the terminals do not break off, a further supply of hot paraffin wax could be run into it. The main point is to keep all the parts of the coil thoroughly protected from moisture, which it is the function of the paraffin wax to do.]

### OFFSET CRANKSHAFTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Permit us to thank you for the article in the last issue of the *M.C.J.* upon the advanced crankshaft. You express a wonder why this system is not more largely used. May we say that it is simply due to ignorance on the one hand, and prejudice on the other; we have actually had constructors of cars asking us, before now, "what it meant?" They had never heard of such a thing, consequently, could hardly be expected to understand it. Now that you have so clearly shown that there is a decided gain in the advanced crankshaft, which we have been fitting now for seven years, we hope we may have less difficulty in convincing the public that it is not, because different from

From a Caricature]

Henri Fournier.

[in *Le Chauffeur*.

others, a "freak." If we had only to do with engineers in this business or people who understood mechanical questions we should all of us be very much nearer mechanical perfection than we are, but when we have to sacrifice true design to conform to popular fancy, progress is retarded.—Yours truly,

THE DURYEA MOTOR COMPANY.

### CONVERTING A DARRACQ.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am desirous of replacing my two-cylinder 12-h.p. Darracq with a four-cylinder car. My vehicle is in perfect order, but I am told it will not fetch more than about £150. Would it answer to fit it with a four-cylinder engine of about 12 to 15-h.p.? If any of the readers of the *M.C.J.* have carried out such a change I should be very glad if they would give their experience as to cost, type of engine used, and whether the result was satisfactory.—Yours truly,

PELICAN.

[We do not know of anyone having fitted a four-cylinder engine into a 12-h.p. Darracq, and we are inclined to doubt whether it would pay to do so, as there would be so many alterations necessary, combined with great expense. The market value of the car would not be much in excess of its present worth, as purchasers generally fight shy of re-engined cars.]

CONVEYANCE OF CAR TO IRELAND.—Replying to "A. R." we believe that the charge of the London and North Western Railway Company for the conveyance of a motor-car "uncharged with electricity, gas, oil, or other inflammable vapour," from Holyhead to Dublin is 35s.

## CLUBS AND ASSOCIATIONS.

### AUTOMOBILE ASSOCIATION.

At the Agricultural Hall on Monday the first of an important series of conferences of automobilists was held. This took the form of a reunion under the auspices of the Automobile Association, whose president Col. W. G. Bosworth, occupied the chair, supported by the Earl of Shrewsbury and Talbot, Sir Archibald Macdonald, Bart., Messrs. W. Gibbons, C. Jarrott, J. J. Mann, L. Schlenheim, R. W. Buttemer, C. Cordingley, C. W. Brown, W. M. Letts, Stenson Cooke (secretary), and many other well-known motorists.

Colonel Bosworth told how, recently, two men were charged at Kingston with gross cruelty to a horse. He gave all the details of the brutality, just as they were laid before the magistrates. One man was cautioned and let off, and the other was fined 40s. and 9s. 6d. costs. It seemed that the policeman's common round and daily task was not fascinating enough for him. Like a comedian, he always wanted to play Hamlet. While the police were hiding in the hedges, the cut-throat, the burglar, and the malefactor generally was pursuing his evil practices quite unmolested.

It was proposed that all motorists should be warned of police traps by the association's scouts, and Colonel Bosworth announced a new scheme for assisting the police. The scouts are to wear badges of about the same size as cabmen's badges, which are to be red on one side and white on the other. When a motorist approaches a scout, and the white side of the badge is shown, he will know the scout is signalling: "I am here to help you if you want me." When the red side is showing it will mean that the scout is signalling: "I want to speak to you," and presumably the scout's words will have reference to lurking policemen armed with stop-watches.

Several speakers took part in the conference that followed, and after some discussion it was decided that the services of the scouts should be continued to the assistance of all motorists.

### AUTO CYCLE.

THE Hon. Arthur Stanley, M.P., has consented to again act as the President of the club for the ensuing year. Mr. Robert Todd has been re-elected chairman of the club, and Mr. C. A. Smith vice-chairman. A sub-committee has been appointed to consider the advisability of increasing the limit of cylinder capacity for engines used in racing on enclosed tracks.

Owing to the date of the race for the International Cup in Austria having been postponed until July 8th, it has been decided to extend the time for receiving entries for the English selection trials until Wednesday, April 18th. Entry forms can be obtained from the Secretary.

### SOUTHERN.

THE Southern Motor Club's open hill climb bids fair to be an important event for motor-cycles and tri-cars. The handicapping is in the hands of Mr. F. Straight, and forms can be obtained from the hon. sec., 29, Grantham Road, Clapham Road, S.W.

Members of the Southern Motor Club who attend all the fixtures that an enterprising committee have arranged will have a very busy season. Several hill climbing contests, a petrol consumption trial, garden party, launch trip, gymkhana, inter-club gatherings with the North London and also the Woolwich Motor Club, and an Easter tour to Bath, are included in a lengthy and varied programme.

### NORTHAMPTONSHIRE.

A MEETING of the Northamptonshire Automobile Club has been held at the George Hotel, Northampton. There were present:—Major P. E. T. Hibbert, chairman, the Rev. W. Seggins Pratt, the Rev. William W. Pitchford, Captain W. H. Briggs, Mr. Charles W. Phipps, Mrs. S. Yarde, Mr. A. H. Bryan, Mr. Humphrey Bennett, Mr. Arthur F. Mulliner, and Mr. Sidney F. Harris (hon. secretary). Before commencing business Major P. E. T. Hibbert thanked the members for conferring upon him the honour of electing him their chairman, and said he was most interested in everything appertaining to automobilism and would do everything in his power to make the club a thoroughly useful and successful one. The following gentlemen were elected members of the club:—The Hon. Adrian Verney Cave, the Hon. Edward Douglas Pennant, Captain R. Brassey, Mr. H. S. Hall, Mr. J. C. Hannah, Mr. J. C. Hipwell, Mr. H. T. Mills, Mr. W. B. Shoosmith, Mr. F. H. Thornton, Mr. C. Edmund de Trafford, Mr. Charles Simpson, and Mr. Charles Wicksteed. A letter from Mr. A. Noel Mobbs was read, in which he thanked the members for electing him to serve on the committee, but, as he thought it best for the welfare of the club that persons interested in the motor industry should not be eligible for any position in the club other than that of ordinary members, he felt it his duty to place his resignation in the hands of the committee. A similar letter was received

from Colonel C. E. Foster (director of the Pytchley Autocar Company, Limited). The committee having the same views as expressed by these gentlemen in their letters, it was resolved that a letter be sent to each accepting their resignations, and thanking them for the great assistance they gave in the formation of the club, also stating that the committee fully appreciated the disinterested spirit which prompted their action. A sub-committee, consisting of the chairman, vice-chairman, Captain W. H. Briggs, Mr. A. H. Bryan, Mr. C. A. Phipps, and the hon. secretary, was formed to consider the matter of the appointment of official repairers. It was resolved that a register of motor servants engaged in the county be kept by the club.

#### MANCHESTER.

THIS club's opening run of the season was held on Saturday in bitterly cold weather. About fifty members put in an appearance at the Warren de Tabley Arms at Lower Peover (Cheshire), a favourite resort of motorists and cyclists on the Knutsford-Middlewich road, about twenty-one miles from Manchester. A slight snowstorm was encountered on the outward journey, but there was no heavy downfall and the roads

mobile world. Mr. A. Towler seconded, and Mr. E. Faiers responded. The evening was terminated by a vote of thanks to the chairman, proposed by Mr. C. P. Wilson and seconded by Mr. G. W. Blackburn.

Previous to the concert a special general meeting was held, at which the Halifax Automobile Club was affiliated with the Yorks Automobile Club. The total membership of the club and its affiliated branches is now over 500. More free garages were appointed for the use of members and a complete list will shortly be forwarded to the members.

#### HEREFORD.

THE Herefordshire Automobile Club has always taken a keen interest in the light car movement, as was apparent from its efforts to secure the light car trials of the A.C.G.B.I. being held in that county.

Doubtless the coming contest on May 24th, at Frome's Hill, will attract a large entry, especially as arrangements are being made for the comfort of competitors and spectators on the hill.

THE North East Lancashire Club has now 142 members.

THE opening run of the Chatham and District Motor Club will take place on Good Friday to Herne Bay.

Touring in France. The Felix-Faure Refuge near Pralognan, Savoy.

remained dry. The club have arranged an attractive programme for April. There are Easter tours in North Wales (Bedgellert) or Blackpool at the option of the members, and club runs during the month include such destinations as Chester, Tarporley, Southport, Cranage, Llangollen, Hartford, Rugeley (Staffs), Middlewich and Bakewell.

#### AERO.

MESSRS. WRIGHT, the two brothers who may be said to have solved the first of the problems of aerial navigation by accomplishing with their motor-driven aeroplane a circular flight of 24½ miles, returning to the point of departure, have been invited by the Aero Club of the U.K. to visit England as its guests, and to bring their flying machine over to give a demonstration to members in this country.

#### YORKSHIRE.

THE Yorkshire Automobile Club opened their season with a very successful smoking concert on Friday, the 23rd inst., at their headquarters, the Great Northern Hotel, Leeds. Mr. E. H. Hepper presided over a large company. Mr. W. Penrose-Green proposed a vote of thanks to the artistes, and referred to many matters of interest in the auto-

THE Essex Motor Club will hold an open handicap hill climb at Lippett's Hill, near High Beech, on the 28th prox.

DURING last year the Bury and West Suffolk Automobile Club lost ten members, but, gaining an equal number, its membership remains at 42.

A MOTOR CYCLE CLUB for the Newcastle district is being formed. Mr. W. Stephen, 5, Park Lane, Gateshead, will inform intending members of the arrangements.

#### THE ALBERT BROWN TROPHY.

A TRIAL for cars only will be run on Saturday, May 19th, over a distance of 150 miles. A circular route of seventy-five miles will be mapped out, which will have to be covered twice, with an interval of one and a half hours for luncheon at the place of starting after the course has been once covered. This trial was originally intended for "All British" cars, but being for members of the Motor Cycling Club only, there may be difficulty in obtaining a sufficiently large entry, hence the following parts only must be British made, it being the intention to restrict the deviation from "All British" in future contests as circumstances will

allow, viz., engine, transmission, frame, body, and road wheels, excluding tyres. Any type of four-wheeled car of any horse-power may compete.

A speed of not less than eighteen miles per hour, and not more than twenty miles per hour, will have to be maintained during the whole of the trial. The cars will be observed throughout the entire distance, and kept in charge of the club's officials during the luncheon interval. Marks will be deducted for any minute or portion of a minute during which the road wheels shall cease to revolve, stops for tyre repairs, traffic and luncheon excepted. The cars with passengers will be weighed before the start. A quantity of petrol proportionate to the total weight will be allowed to each car for the distance to be covered. Marks will be deducted for any petrol consumed in excess of the quantity allowed, the car losing the least total number of marks to be declared the winner of the trophy. The trophy will be held by the winner for one year, but cannot be won outright. A gold medal will be awarded to the winner and silver and bronze medals will be given for second and third places. Certificates will be given to all cars accomplishing a non-stop run. Any car being beyond one hour late over the whole distance shall be disqualified. Each entrant must provide one observer, who shall be at the disposal of the club either as marshal or observer, but in no case shall an observer observe the car with which he is entered. Each car must be driven throughout by the entrant, who shall be a member of the Motor Cycling Club. Entries close on May 5th. The necessary forms may be obtained of Mr. J. Van Hooydonk, Spring Villa, High Road, North Finchley, N.

### STUDS ON WHEELS.

FOR employing studs in the driving wheel of a motor-wagon, Messrs. Davenport, Limited, brewers, Birmingham, have been fined £4 14s. by the Halesowen magistrates. The driver of the wagon, who experienced some difficulty in ascending Mucklow Hill, and inserted the studs in the wheel, was fined 22s. at the same court for breach of the regulations.

### AN "AMATEUR MOTORIST."

WILLIAM MILSOM, a cab-washer, who stood in the dock at Marylebone on Monday, had a car costing £700 sent to him to clean, and took the opportunity of going for a trial spin on the vehicle, accompanied by several other equally enthusiastic cab-washers.

Milsom and his party set out for Hampstead. How far they got is best told in the language of a constable who gave evidence. "Prisoner had lost control of the car," he said. "He tried to back it towards Upper Park Place (all this happened in Linhope Street), but instead he drove it into some railings on the footway and damaged the car extensively. Milsom admitted he had no licence, and as he was drunk he was arrested." It was said the repairs necessary might cost £130, and Milsom admitted his offence and pleaded drunkenness. He was given one month's hard labour for driving to the common danger, and fined £20, or two months, for driving without a licence.

### AN "AUTOMOBILE ALPHABET."

- A for "Argyll," a car very well known.
- B "Baby Peugeot" a good record has shown.
- C is for "Clement," a car of great fame.
- D as a "Darracq" has made quite a name.
- E Clifford Earp, the king of his "Trade."
- F is for Friswell's, where bargains are made.
- G "Gladiator," a nice little car.
- H for the "Humber," well known near and far.
- I for the "Iris," coming on strong.
- J is for Jarrott, who sends 'em along.
- K "Krebs" carburettor, a maker of fame.
- L for the "Leader," which lives up to its name.
- M for "Mercedes," to drive one's a treat.
- N for the "National," a hard 'un to beat.
- O for "Orleans," a car, not a town.
- P is the "Panhard," of world-wide renown.
- Q is a "Quadrant," a motor or bike.
- R for "Renault," a car we all like.
- S for the "Siddleley," a car of the times.
- T is a "Thornycroft," on the same lines.
- U for the "Unic," they're selling right well.
- V for the "Vulcan," now quite in the "sell."
- W a "Wolseley," exceptionally good.
- X is the Xcellent tests it has stood.
- Y is the Yankee, who makes by the score,
- Z is the "Zenith,"—I need say no more.

### PUBLIC MOTOR SERVICES.

THE Clacton-on-Sea Motor Omnibus Company, Ltd., will have a capital of £15,000. The offices of the company are at Avenue Chambers, Southend-on-Sea.

A MOTOR vehicle service between Andover and Tedworth will shortly be inaugurated.

A MOTOR-CAR service, or possibly a fleet of motor-buses, will probably run in the Morecambe district during the coming summer.

THE capital of the London Road Car Company is to be increased by the creation of 20,000 new Preference shares of £10, in order to secure the delivery of more motor-omnibuses.

IN a bill before a House of Lords Committee, the Mersey Railway Company have sought power to carry passengers by omnibus to and from their stations. The proposal was opposed by the Birkenhead Corporation, who are the owners of the ferry over the Mersey, and of a tramway system within the borough, and the railway company argued that the Corporation were really in the position of competitors. The Committee granted the powers asked for by the railway company, the routes to be taken by the omnibuses being left to the decision of the Corporation, subject to an appeal to the Board of Trade.

AT a meeting of the Edinburgh magistrates permission was granted to the new motor-omnibuses to have a stand at the Waverley Market.

### ROAD REPORTS.

POLICE TRAPS.—A police trap is in fairly constant operation in the High Street, Kensington.

SHEFFIELD.—Motorists will sympathise with the ratepayers of the Meersbrook district of Sheffield, who are trying to get the local authorities to consider the state of the roads in the locality—at present in a sadly neglected state.

LANCASHIRE.—The Committee of the North-East Lancashire Automobile Club refer to experiments now being conducted by the Lancashire County Council, with the object of minimising the dust nuisance; the Council is spending £500 on these experiments, one of the members of the Club, Mr. J. R. Thompson, having brought the matter before the Council.

### MOTOR-CAR ACCIDENTS.

As Mr. J. E. Hammond, of Fairfield, Baildon, was driving along Valley Road, Frizinghall, Bradford, on Friday of last week, he met another motor-car coming in the opposite direction. He rounded this, but ran full tilt into a horse and trap which was following in its rear. The driver of the trap was thrown into the road and was removed to the infirmary suffering from concussion of the brain. Mr. Hammond was also thrown out of his motor-car, together with his passenger.

IN swerving aside to avoid two little girls a motor-car crashed into the wall of Battersea Grammar School, pinning against the wall Henry Webb, a carriage cleaner at Clapham Junction station, and a boy named Hugh Challice, a pupil at the Grammar School. The former sustained a fractured thigh and the latter a fractured skull. Both had other injuries, and their condition is serious. The car was considerably damaged.

A MOTOR-CAR owned by Mr. Richard Reynolds, of Trinity Road, Wimbledon, ran into John Farr, a labourer, at Barnet Hill, where he appears to have been lying asleep on the road. Farr died within an hour.

### CASES AGAINST MOTORISTS.

AT the Malton County Court a coal dealer has claimed £10 from Lord Garnock as compensation for damages alleged to have been caused through a collision between his lordship's motor-car and plaintiff's pony and cart. The evidence showed that on Friday, December 15th last, Lord Garnock had been driven in his motor to Malton Station. On returning from Railway Street into Yorkersgate, it was alleged, the chauffeur pursued a serpentine course, and collided with the plaintiff's cart, which was standing near the kerbstone. The jury, after short deliberation, awarded a verdict for the plaintiff for £6 damages.

Place.	Summoned for	Result.
Tunbridge Wells ...	Dangerous driving	£5, etc.
Birmingham ...	Dangerous driving	20s.
Marlborough Street (London) ...	Dangerous speed	£10, etc.
Kingston ...	Three cases of exceeding speed limit at Esher	£5, etc.
" ...	Exceeding ten mile limit in Richmond Park	£2, etc.
East Norton ...	Reckless driving	£1.
Sheffield ...	Dangerous speed	£10.
Lambeth ...	Back plate unilluminated	10s., etc.
Brighton ...	Dangerous speed	40s., etc.
Croydon ...	Exceeding legal limit	£10, etc.
Middlesbro ...	Dangerous driving	40s.

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

# THE Motor-Car Journal.

VOL. VIII.]

LONDON, SATURDAY, APRIL 7, 1906.

[No. 370.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

WE learn that a resident of Norbury, near Croydon, has been advising passing motorists of the presence of a police trap in that district. To those who may have appeared to have been going too fast he addressed a word of warning, as many others have done. Now comes a summons for "obstructing the police in the execution of their duty." The point is one of considerable importance, especially in view of developments that have lately taken place with regard to the organisation of the motor movement for purposes of defence.

Throughout the south news comes of the revival of the trapping business by the police, and we appeal to our readers to assist their fellow motorists by keeping us informed of the presence of such devices on the road.

### The London Clubs.

AROUND London there are growing up several local clubs, between which some sort of federation might well be established. Something of the kind has already begun in the joint competition shortly to be held between the Southern Motor Club and the North London Club, and therein may be the nucleus of a great metropolitan gathering. Woolwich, Ilford, and suburban Essex, Hertfordshire, and the Surrey clubs are all within the area of the Home Counties, and a meeting of the committees of all these organisations might usefully be held with a view to bringing about the more effective organisation of Metropolitan motorists for purposes of defence. There need be no interference with the present free control of each association; but occasional conferences would be extremely useful and important.

### The Irish A.C.

THE report of the committee of the Irish Automobile Club presented at the annual meeting recently referred to the devolution of authority recently mentioned in these columns. The Irish Club will now be recognised throughout the world as the directing power of the automobile movement in the Emerald Isle, just as the British Club exercises authority in this country. At the same time there will be reciprocity as between members of both organisations in taking advantage of better hotel terms and the like arranged by either club. This will be an important concession to members of the A.C.G.B.I. travelling in Ireland. New premises have been taken in Dawson Street, Dublin, and these are shortly to be opened by the Earl of Aberdeen, who has consented to become patron of the Club. Arrangements are also in progress for amateur reliability trials to be held in June, with Dublin as a centre, and some of the hills in Co. Wicklow providing the hill climbs which have become an essential of such events. It is satisfactory to learn that the good relations which prevailed between the authorities and motorists at the time of the Gordon Bennett race have continued, and that the official voice of automobilism in Ireland is

on good terms with practically all the local and national authorities.

### The Motor Union.

SUPPLEMENTING the report of the Motor Union on another page, we would add to the congratulations of Mr. G. T. Langridge, Dr. Hopkins Walters and Mr. J. E. Hodgkin. The latter, who is Secretary of the North Eastern Automobile Association, referred to the efforts of the clubs comprehended in that organisation to stop applications for speed limits being made by local authorities. By appointing observers in every one of the local authorities' districts in their area, who are able to see members of the Councils and discuss the matter with them, they hope to prevent any action being taken. The advantage of appointing as honorary associates such observers is apparent. They also appoint as honorary members members of Parliament in Northumberland and Durham. It would certainly be an advantage to be able to point to a list of fifty members of Parliament who were honorary associates of the Motor Union. The question of local secretaries becoming honorary members of other clubs has not been generally dealt with in the past, but this, again, is a matter which should be regarded as of great importance in the development of a national automobile organisation. The more the officers come into association with each other the better will it be for the propaganda work.

### The Cost of Examination.

IN the course of his speech to the members of the Motor Union at their annual meeting, the Hon. Arthur Stanley referred to the subject of driving certificates, contending that the Automobile Club rather than the Government was the agency to undertake such work. Doubtless there is much to be urged in favour of such a view in the early days of the movement, and the A.C.G.B.I. is to be commended on the way it has carried out its self-imposed duty. But as Motorism becomes universal there will be a tendency for the licensing authorities to develop into the examining body. Such a course seems consistent with the public view of things, however well qualified the people in Piccadilly may be to continue the work. Meanwhile, however, there is every chance of usefulness for the A.C.G.B.I., and we would suggest that the question of fees should be thoroughly overhauled, with a view to reduce the charges for examination to such a point that, while making no loss to that department, the fees cannot be regarded as a deterrent to prospective drivers. There seems an impression that the cost is, at present, too high, and some official communication on this point would be welcomed by many readers.

### Cars in Australian Elections.

HERE we have fully acknowledged the power of the motor-car as a political force. In Australia the preliminary educational work is still in progress. At a recent municipal election in Sydney the idea occurred to some of the candidates, who thought the charm and novelty of a ride in a motor-car would induce reluctant voters to do their duty. So for some hours after polling began the motor-car was much in evidence,

taking load after load of passengers. People gladly took a seat in the luxuriously-upholstered carriages. No sooner were they emptied than off dashed the drivers for fresh occupants. And so for a time the polling was remarkably brisk. "We have a nice carriage at your door, ma'am," said an energetic canvasser. The lady-voter put on her bonnet and stepped in. "Hope you enjoyed your ride," said the cavalier as they reached the booth. "I've had a *foine roide*," said the lady, with pronounced brogue. "And you won't forget Mr. So-and-So," he added. "No," was the reply, "I won't forget him, I'll scratch his name out, for he's not my man." Then the truth dawned upon candidates and canvassers that they might be bringing up their opponents' friends as well as their own; and the motor-cars were little used afterwards. Their utility was of doubtful advantage; and, as a matter of fact, none of the motor-car candidates secured election.

Mr. W. Crawshaw, of Rainthorpe Hall, near Norwich, on his 15 h.p. Brooke Car.

#### Cordingley's Show.

ALTHOUGH the great Spring Show of 1906 has closed, we may be pardoned for referring to the exhibition as a whole, apart from the notices of particular stands which appear on another page. From whatever point of view it may be regarded it was a success, and the volume of business transacted was greater than at any previous display. This result was highly gratifying to all concerned. More than that, the inquiries were numerous from all sections of society, while the queue of motor-cars and carriages which was drawn up in the Upper Street each afternoon testified to the nature of the attendance. Altogether the event has left a most pleasant impression, and proves conclusively that there is a demand for a Spring Show, and that the popularity of the Agricultural Hall continues and is likely to be maintained for a good many years to come.

#### At the Show.

OUR recent comment advising exhibitors to exercise some care in the selection of their representatives in charge of exhibition stands was generally accepted as worthy of adoption; in some cases where the warning was ignored many opportunities for business were lost. Certain stands at the Show were conspicuous for their uniform neatness throughout the week; others were occasionally wanting in order. Those in charge of the displays were generally good; but an amusing dialogue occurred at one stand. The proprietor of a certain exhibiting concern called at his stand and asked the attendant for some particulars. These were given in an off-hand manner, glossing over a lack of mechanical knowledge. After a few minutes of conversation, extracted with difficulty, the visitor made his identity known, and then the advisability of extending

courtesy to every inquirer was apparent. Those who go to shows must be paragons of patience as well as patterns of persistency. Ignorance and inattention to those who evince any sort of curiosity are not the avenues to success at such displays.

#### Tyres.

VISITORS to the Show could not fail to notice the excellent tyre section in the Gallery, and, although the Continental and some other well-known makes were not represented, there were features of merit and interest. In fact, the makers of the dozen or so tyres shown were quick to congratulate themselves on the way they were able to bring their specialities to the notice of motorists, ever on the look-out for the acme of manufacture in tyres. In our report mention is made of the several varieties exhibited, and it is evident that quality and good design are characteristics of some of the lesser known tyres, as well as of the more widely adopted makes. With regard to non-skidding devices, most of the makers are now regarding 4,000 miles as a tribute to the durability of their devices, and all seem as though they will be very busy for some months to come executing orders lately obtained.

#### The Gallery.

DOUBTLESS in the early days of the shows many visitors ignored the Gallery. It is very different to-day, for, to adopt the late Sir Wm. Harcourt's phrase, "We are all motorists now," and it is recognised that many major as well as minor novelties that contribute to the happiness of the persons on the car are to be found above the ground floor. This is confirmed by a writer in last week's "Clarion," who says:—"I favour the Gallery as a place where a non-technical visitor can be made acquainted with the improvements and new ideas of the motor industry as exemplified in accessories and parts to the car proper. Indeed, I believe that only in the Gallery exhibits can a man find much of interest unless he is on the look-out for a car, or has an expert motor mechanic to explain the varying details of construction adopted by competing builders of the complete car." The success of the firms in the Gallery at last week's display was a notable feature of a notable exhibition.

#### New International Race.

HAVING served an eminently useful purpose, the Gordon Bennett race is to pass away—honoured by motorists and recognised as one of the incentives to perfection in the early days of a quickly growing business. Now the authorities of the automobile world are looking about for a new form of contest which shall attract competitors from all ends of the earth and do something to "improve the breed of motor-cars." A committee is to be appointed in this country to secure the consideration of rules for a new International Race on a rational basis. It is proposed that, subject of course to the consent of the donor, the Gordon Bennett trophy should be ascribed to this event, and that the matter be definitely settled at the International Meeting of Automobile Clubs to be held in June. France, Germany, America, Austria and England have previously figured in these events; Italy must certainly be reckoned in future calculations; Switzerland may possibly renew her one solitary attempt; and Belgium and Holland will probably come into line with other countries. Anyhow, the prospects of a really international competition—if the scope and rules be sane and reasonable—are brighter than ever before.

#### The Repair of Roads.

ALREADY the Northamptonshire Automobile Club, reference to the last meeting of which is made in our last issue, is taking active measures to influence the local authorities in the direction of improving the roads of the county, and it has been resolved to send a letter to the County Council asking the Roads Committee to take into their earnest consideration the following points connected with the repair of the roads:

—(1) That instructions be given to the District Surveyor throughout the county, that when they are repairing the roads only one side is to be disturbed at a time, so as to leave a smooth passage, and thus to avoid the great destruction of valuable tyres on motor-cars and other vehicles having rubber-tyred wheels. (2) That in those cases where steam rollers are used, and the stones are not rolled in before dark, a light be placed at either end of the unrolled portion, so that the risk of accident, by drivers suddenly coming in contact with the stones, may be avoided. This precaution, we may add, is taken by the Wilts, Gloucestershire and Warwickshire County Councils. (3) That the system of placing large stones between the road and grass sides, which obtains in some districts, be discontinued, and that the stones now existing be removed, as they are a source of great danger to persons travelling at night, as at times it is necessary for them to draw on the grass side to pass another vehicle on a narrow road. Attention is also to be drawn to the fact that the

Dennis car did well, establishing a record for an officially observed run, while the performances of the Collier tyres amply justified their entry in the Trial and should be highly gratifying to their makers. Four of the speedometers engaged had non-stop records each day of the run, and altogether the trial has given further evidence of the reliability that is now a recognised factor in the automobile world.

#### The Post Office and Automobiles.

IN the course of his paper at the Society of Arts last week, Mr. Norman D. Macdonald said he had been consulted several times by the General Post Offices, both in London and Edinburgh, as to the possibility of getting the mails taken by motor-cars on roads more than they are at present. And specially had he been asked to organise such services in the populous parts of Scotland. Had it been the Highlands and

The Hon. Maurice Gifford's 20-h.p. Sunbeam Car. The Hon. Mrs. Gifford is at the wheel, and her husband is the central figure in the group. The Car is the third Sunbeam owned by these ardent motorists. The gallant officer, who, as will be remembered, lost his right arm in South Africa, is, however, quite able to drive the vehicle, which speaks well for the simplicity of its control.

by-law as to the lights on vehicles now in force is not sufficient, as it does not compel the showing of a red light at the rear of all vehicles, but only those used for carrying timber or any load projecting more than three feet to the rear.

#### End of the A.C.G.B.I. Trials.

ON Saturday the trials which were in progress throughout March under the auspices of the Automobile Club were concluded, and the competitors and the public now await the judges' report. This should not be long delayed, and everything should be done that is possible to hasten its publication, so that the firms enterprising enough to participate may obtain the advantage of their venture during the coming season. From the summary on another page it will be seen that the

islands it would have seemed natural, but not round Edinburgh and Glasgow, amidst a network of railways. The Post Office officials were as clay in the hands of the potter when they started the Parcel Post. Hence they gave the whole thing away to the railways, which actually get 55 per cent. of the receipts for merely carrying the Parcel Post baskets. The Post Office provides all the plant and labour, packs, sorts, sees to the safe handling, and even conveys to and from the train for its 45 per cent. Now it is evident that during the day, to compete with the railway parcels, the Post Office must send its baskets by the same swift trains. But at night there is a lull, during which slower methods may prevail. The Post Office would fain get behind its bad bargain by movements by road in the night seasons. Their only hope to get it done is by big organisation, and probably by those which exist already, having staff, offices, managers, depots, and so on.

### The Daimler Company's New Chairman.

It was something more than a mere coincidence that during the week when the present position of the motor-bus industry was being well demonstrated at the Agricultural Hall, London, two well-known motorists should be writing upon the subject in relation to tramways, their papers being read before the A.C.G.B.I. and the Tramways and Light Railways Association by Messrs. E. Manville and N. D. Macdonald respectively. The latter gentleman is the son of the Lord Justice Clerk of Scotland, whose automobile enthusiasm dates from a period anterior to the famous 1,000 miles trial. Mr. Manville, too, has many claims to secure a respectful consideration for the paper, which we summarise on another page. He has done much valuable engineering work in Ceylon, Canada, Egypt, and Argentina, while his work in connection with the motor-car movement in England has been notable. And now that Sir Edward Jenkinson has relinquished the chairmanship of the Daimler Motor Company he has succeeded to that position—a hopeful sign that the recent prosperity of this sturdy British concern will be fully maintained.

### Progress in the Argentine Republic.

AN Argentine correspondent writes that, considering the location of the city and the age of the automobile industry, Buenos Ayres is to-day probably more of an automobile centre than even Paris or London, over 1,000 motor-cars being at present in use. Three-fourths of the vehicles are French, German, or British, but principally the first-named. Most of the Government and city officials own motor-cars. The President of the Republic has a Panhard and a Krieger electric, while his son has a Panhard and his grandson a Clement-Talbot. The Minister of War, General Godoy, has a Fiat and a Hotchkiss. The Mayor owns a Mors. Commercial cars are now being introduced, and, although there are only a few, information gathered from various important mercantile concerns indicate that within the next few months probably seven or eight such vehicles will be received from France. The good roads movement is gaining many adherents in Argentina, through the efforts of motorists. The Minister of Public Works has recently set aside a special fund of £40,000 for the purpose of having new macadam roads built and others repaired.

### Motor-Car Makers Wanted.

PERHAPS the most authoritative evidence of the public recognition of the growth of the automobile movement that could be afforded comes in the earnestness with which several local public bodies are placing the advantages of their areas before manufacturers. Within recent months Peterborough has sought to attract motor-car makers; the authorities at Letchworth are receiving many firm enquiries as to their development now rapidly proceeding; and the District Council of Bourne, in Lincolnshire, is the latest enterprising authority to take advantage of our columns with this end in view—altogether a tribute to the respect which even agricultural districts are willing to pay to the motor-car.

### Trouble in Russia.

AN English motorist recently took a trip to Russia, and included in his personal baggage a "Car" vulcanizer. On arriving in that country the motorist's baggage was examined by the customs officials as a matter of course. The vulcanizer was noticed, but apparently aroused no suspicions at the time, and the motorist went his way. A few hours later a Russian policeman entered the hotel where the motorist was staying, arrested him on suspicion of smuggling explosive machines into Russia, and, in spite of heated protests from the motorist, locked him up for three days. In the meantime, all the baggage was seized and the vulcanizer subjected to very close scrutiny. Evidently the little steam gauge on the appliance was taken as a timepiece properly adjusted to ignite

the supposed deadly explosive, and the vulcanizer being made of bright gun-metal almost throughout, with a tubular steam generator, no doubt encouraged the Russian officials in the belief that the apparatus was an infernal machine or an explosive of some kind. Negotiations were opened up with London on the subject, and as a result the motorist was promptly released and all his personal belongings, including the vulcanizer, were restored to him.

### Local or National Fame.

RECENT inquiries from commercial firms for the hire of light delivery vans propelled by mechanical means have brought some replies from makers in various parts of the country. They reveal an amount of enterprise on the part of many local firms that seems to suggest the widespread character of the automobile industry in the near future. Many local engineers are combining with body builders in the assembling of vehicles adaptable to various trades and for different purposes. It is to be hoped that care will be taken both in the design and construction of such vehicles to secure high efficiency, great simplicity, and durability of the parts. Otherwise a retardation of the general advance may result in districts that have been ill-served. Here again comes the difficulty of deciding as between the locally-made vehicle and that from a maker of national repute and experience. There is much to be written and plenty to be said on both sides.

### Railway Crossings.

THERE should be an important advance in the condition of British roads ere long, for several organisations are looking with eager eyes to their improvement. The Automobile Association is watching the untrimmed hedges and the unnamed villages; the Motor Union has correspondents always looking for neglected roadways, and the Roads Improvement Association is agitating against unprotected and badly-guarded railway crossings. All users of the roads in East Anglia will rejoice at the action which has led the Great Eastern Railway Company—ever sympathetic towards motorism—to promise attention to the bad condition of the crossing south of Dereham station, on the road leading out of that place to Norwich. Several complaints have been made as to its uneven surface, and now that the G.E.R. has promised repair we trust all possibility of danger in that district has been dispelled.

A CANDIDATE at a municipal bye-election in Liverpool is favouring the introduction of a motor-bus service.

AT a meeting of the Students' Section of the Institution of Electrical Engineers last week, Mr. M. G. Tweedie read a paper on "Electrical Ignition, with special reference to its Application to Internal Combustion Engines."

MESSRS. J. I. THORNYCROFT AND CO. have just delivered their first six-cylinder car. One of its novel features is that two of the cylinders are placed under the driver's footboard in order to shorten the length of the bonnet.

IN connection with our recent article suggesting the use of producer gas as a fuel for the internal combustion engines and public service motor vehicles, we hear that a car fitted with such an installation is already in operation in Italy.

THE "Lady's Pictorial" wrote appreciatively of the Motor-Car Exhibition, where its representative saw the "Proven Rain-and Wind Shield," the "Sigaire and Nandin," small car and "an inexpensive 12-h.p. four-cylinder car," known as the "Prima-Mode." We wonder if the printer was altogether responsible for such novelties.

THE Motor Union have decided to contribute £30 towards Mr. F. W. Baily's expenses in his appeal against a recent decision of the High Court, when he was adjudged to pay £1,500 damages to the widow of a cyclist who was killed in a street accident. Counsel's opinion has been taken in the matter, and Mr. Tindal Atkinson advises that there was a miscarriage of justice in the case.

## ON THE RIVIERA.\*

NOW that the Riviera season is on the wane, and British tourists are returning from the land of the cypress and the olive to the uncertain climate of these northerly shores, comes a new book which will freshen their memories and beguile a passing hour. The Rev. S. Baring-Gould is known as the chronicler of Devonshire folk lore and a gossiping guide to Dartmoor; now he appears as the historian of the Riviera and a courier to the Ligurian coast. His latest volume does not presume to be a consecutive history of Provence and Genoese Liguria, but by recalling some of the prominent incidents in the history of the coast and giving short biographies of the persons associated with the principal towns, the author has written an interesting book on the Riviera. The English visitor calls the entire coast—from Marseilles to Genoa—the Riviera; but the

Cannes, and there built for himself a winter residence. He talked about it in the papers. Eventually it was heard of by the physicians, and they ceased to recommend their patients to go to Montpellier, but rather to try Cannes. When Lord Brougham settled there it was but a fishing village; in thirty years it was transformed; and from Cannes stretches a veritable rosary of winter resorts to Hyeres on one side to Alasio on the other; as white grains threaded on the line from Marseilles to Genoa. As this chain of villas, hotels, casinos, and shops has sprung up so recently, the whole looks extremely modern and devoid of historic interest.

But the Riviera is not destitute of history, as is well shown in this volume. This modern fringe is suspended from an ancient garment, merely a "superficial sprinkling over beds of remote antiquity rich in story." The natural features are described with vigour and freshness.

The traveller approaching the Riviera by the line from Lyon, after passing Valence, enters a valley that narrows, through which rolls the turbid flood of the Rhone. Presently the sides become steeper, higher,

FIG. 1. Automobile Flower Fete at Nice. Over Sixty Decorated Cars, including that of the King of Sweden, took part in the Flower Fete at Nice on Sunday last. The first prize for the best decorated vehicle was awarded to Count Zopolski's Delaunay-Belleville.

French distinguish their portion as the Cote d'Azur, and the Italians distinguish theirs as the Riviera di Ponente.

Lord Brougham was the discoverer of this district, so far as the visitor from our own country was concerned, and, as the Rev. S. Baring-Gould tells the story, this was due to an accident:—

In 1831, Lord Brougham, flying from the fogs and cold of England in winter, was on his way to Italy, the classic land of sunshine, when he was delayed on the French coast of the Mediterranean by the fussiness of the Sardinian police, who would not suffer him to pass the frontier without undergoing quarantine, lest he should be the means of introducing cholera into Piedmont. As he was obliged to remain for a considerable time on the coast, he spent it in rambling along the Gulf of Napoule. This was to him a veritable revelation. He found the sunshine, the climate, the flowers he was seeking at Naples where he then was at Napoule. He went no farther; he bought an estate at

more rocky, and draw closer; on the right appears Viviers, dominated by its cathedral and tower, square below, octagonal above, and here the Rhone becomes more rapid as it enters the *Robinet de Donzere*, between calcareous rocks full of caves and rifts. Then, all at once, the line passes out of the rocky portal, and the traveller enters on another scene altogether, the vast triangular plain limited by the Alps on one side and the Cevennes on the other, and has the Mediterranean as its base. To this point at one time extended a mighty gulf, seventy miles from the present coast-line at the mouth of the Rhone. Against the friable limestone cliffs the waves lapped and leaped. But at some unknown time a cataclysm occurred. The Alps were shaken as we shake a tree to bring down its fruit, and the Rhone and the Durance, swollen to an enormous volume, rolled down masses of debris into this gulf and choked it. The Durance formed its own little *crau* along the north of the chain of the Alpines, and the Rhone the far larger *crau* of Arles, the pebbles of which all come from the Alps, in which the river takes its rise. But, in fact, the present *craus* represent but a small portion of the vast mass of rubbish brought down. They are just that part which in historic times was not overlaid with soil.

Then follows an alluring picture of the vegetation and the

\* "A Book of the Riviera." By S. Baring-Gould. (London: Methuen and Co.)

beauty of the coast, followed by a characterisation of its population, which will help the sojourner among its people to understand much of their ways and habits. First, there were the Ligurians; then the Phœnicians established trading depots at Marseilles, Nice, and elsewhere along the coast. They constructed the Heracleian road, afterwards restored by the Romans to connect all their settlements from the Italian frontier to the Straits of Gibraltar. Succeeding history is full of interest—exciting and romantic—and in no part of Europe did pagan customs linger on with such persistence as in the land of Provence, among the people of mixed blood, Ligurian, Phœnician, Greek, Roman, Saracen. Each race brought some strain of fancy to the common stock, and the Battle of Flowers, that draws so many from all nations to Nice, Mentone, and Cannes, is a direct descendant from the floral games of the Greek settlers. Its present decent character is a comparatively modern acquisition.

The descriptions of the towns of the Riviera are lucidly comprehensive and attractively written, as, *e.g.*, the references to Mentone and Aix, which we give below as typical of the author's style.

There is little of architectural interest in Mentone. The church, built in 1619, and added to in 1675, is in the tasteless style of the period, but tower and spire are effective from a distance. In the church is preserved a processional cross, the staff of which is formed out of a Turkish lance taken by Prince Honore I. of Monaco in the battle of Lepanto, 1571. But if Mentone be somewhat deficient in picturesque features, the same cannot be said of Roquebrune, which for so many centuries shared its fortunes. It is dominated by the castle of the Lascaris. At Roquebrune every year, on the first Sunday in August, the Mystery of the Passion is represented in a procession that illustrates the various scenes of the portentous tragedy. It starts from the chapel of N. D. de la Pansa, on the east side of the little town, a chapel decorated with frescoes of the fifteenth century. The narrow streets passing under vaults, the quaintness of the houses, above all the superb panorama commanded by Roquebrune, make it a place meriting a visit. Still more quaint and picturesque is Castellar, forming a quadrilateral fortress planted on a plateau commanding two valleys.

Aix is perhaps the most dejected of cities. At one time the life blood of the empire poured through it. The great road that left the Flaminian gate of Rome passed along the coast of the Ligurian Gulf, crossed the shoulder of the Alps at La Turbie, and then, going through Nice and by Cannes, reached Frejus. At that point it turned inland, left the sea behind, and made direct for Aix. Thence it stretched away to Arles, and from that city radiated the routes to Spain, throughout Gaul, and to the Rhine. Through the market passed all the trade of the West; through it tramped the legions for the conquest of Britain and the defence of the Rhenish frontier; through it travelled the treasure for the pay of the soldiery; through it streamed the lines of captives for the slave market at Rome. But now Aix is on no artery of communication. To reach it one must go in a loitering and roundabout fashion by branch lines, on which run no express trains, in company with oxen in pens and trucks of coal.

One extract more from a book that will form a charming companion to those who go to the Riviera and a pleasant memory to those who have made the visit. The Rev. Baring-Gould revels in descriptive writing as well as in legendary lore, and every chapter has its interest. With his aid the reader can revisit the scenes of the south, and his picturesque style enables those who have not been to the Riviera to conjure up its scenes of beauty.

A traveller must be very *blase* or very obtuse who is not spellbound by the exceptional beauty of the Esterel. This mountain mass, like the Chaine des Maures, is an interruption of the continuity of the limestone of the coast. It consists of a tremendous upheaval of red porphyry. Unlike the Maures, with its schists and granite, the porphyry assumes the boldest and most fantastic shapes, and the gorgeousness of its colouring defies description. These flame-red crags shooting out of a sea the colour of a peacock's neck, or out of dense woods of pine, afford pictures where form and colouring are alike of sovereign beauty. It is a region unique in Europe, extending something like twelve English miles from east to west, and as much from north to south. The medium height of its summits is 1,500 to 1,800 feet, so that the elevation is not great, but it is cleft by alleys that abound in scenes of the finest order of picturesqueness. Here and there the granite and gneiss appear; elsewhere serpentine, trap, basalt, and blue quartzite porphyry. Beside this is the new red sandstone and the Bunter sandstone. Variety of soil gives variety of vegetation; plantations of mimosa, not over a quarter of a century old, thrive on the primitive cork trees, umbrella pines, oaks, bushes of cistus, laurestinus, myrtle, rosemary, heath, broom, and in the spring gleam the white spears of the asphodel. It is a district in which geologist, botanist and artist will revel alike.

## CARE IN DRIVING.

IT may not have occurred to some that there is almost as much individuality in a motor as in a horse, but it is a fact which cannot be too highly appreciated. One will show a crankiness in running that will puzzle its builders, and another will run so smoothly and uniformly that it will prove a delight to its owner. Nearly every vehicle has its weak point, and it is the duty of the driver to find this out and to favour it just as he would a high-bred horse that possesses some slight defect which otherwise does not affect his standing as a good animal. The amateur and the novice always start and stop a vehicle by a series of short jerks, which is a strain to the mechanism; in fact, many drivers, no matter how much experience they have had, never overcome this novice-like method, simply because they do not understand the nature of their iron steed. If half the accidents and breakdowns to motor-cars could be classified, it would probably be found that a great number of such misfortunes were due either to poor driving or to the neglect

Mr. S. G. Gamble, Southern Divisional Officer of the London Fire Brigade, on his 16-h.p. Albion Car.

of some slight derangement. Creaking springs and noisy mechanism are the most common accompaniments of ill-kept motor-cars as they proceed along the public thoroughfares. Oiling does not suffice for this, and the incompetent driver waits for a favourable opportunity to send the vehicle to some repair shop, there to discover the cause of all the noise. A man with a fair knowledge of the construction of his motor-car could find out the cause of the noise in five minutes, and remedy it as quickly. The neglect which ignorance allows to progress means eventually a bill for repairs that astonishes the person who has to pay it. It also means the shortening of the useful life of the car by many months. Such experiences rarely happen to the expert motorist who knows the principles on which his machine is constructed, and has gone below the mere surface instructions in his driving of a motor-car.

THE Town Council of Harrogate is seeking a L.G.B. regulation to limit the speed of motor-cars passing through certain streets in the borough to ten miles an hour.

It was mentioned at the annual gathering of the Naval Volunteer Cruising Club at Brighton, that there was every indication of the coming season being a record one for club racing. It was hoped to arrange a series of competitions for motor-boats belonging to members.

## SOME CURRENT TOPICS.

### A Run on a "Standard" Six-cylinder Car.

The Standard Motor Company, Ltd., Coventry, have been devoting attention for some time past to the production of a six-cylinder car, and recently we accepted an invitation of Mr. Budge, the designer of the vehicle, for a short run over a more or less hilly course. To be brief, the most notable features in the behaviour of the car were the extreme smoothness and sweetness of running at all speeds, varying from two to fifty miles per hour, and the wide range of control by the throttle. The car can be started on the direct drive—which is on the third speed, and not the fourth as usual—even on a slight incline, and will "pick up" on a gradient of 1 in 10. On ordinary roads and traffic there is no need to touch either the gears or the clutch, as the car can be controlled by means of the throttle lever only. No shock was experienced when slowing up or in the accelera-

within a period of about three months, ready for the Cordingley Show. Mr. Grimshaw added that at Bamber Bridge, near Preston, the Critchley-Norris Company had a well-equipped factory with plenty of room for extension, and that at the present time the erection of a new shop, 500 ft. long by 80 ft., was well in hand. The development of the motor-omnibus movement in this country has been so rapid that the demand has far exceeded the supply by home builders, hence the fact that the majority of those at present in service are of foreign construction. The number of British builders is, however, slowly but surely increasing, and with the addition of the Critchley-Norris Company we are a step nearer to the time when it will no longer be necessary for our 'bus companies to go abroad for their vehicles.

### British Production and Foreign Imports.

A good deal has been heard during the past month or so with regard to the relative value of the British output of motor-cars and the imports of foreign automobiles into this country. When first the subject was raised we expressed the opinion that the figures which had been advanced with regard to the value of

The New Clement-Bayard Six Cylinder Racer.

The Clement-Bayard Company are building three new racers for the contest for the Grand Prix de l'A.C.F. The above illustration depicts one of these vehicles with M. Villemain at the wheel. The car has a six-cylinder engine and live axle, and is stated to have, in the course of its preliminary trials, attained a speed of 97 miles per hour.

tion of speed. The car was fitted with test body and carried three passengers, including the driver.

### Motor-'Bus Construction in Great Britain.

An interesting function in connection with the motor-omnibus movement took place in London on Wednesday of last week, when the Critchley-Norris Motor Company gave a private dinner to celebrate the introduction of the Critchley-Norris motor-'bus, which made its public debut at the Agricultural Hall Show, and a description of which was concluded in the last issue of the M.C.J. Mr. J. S. Critchley, in a short speech, gave some interesting particulars of the inception of the vehicle, and made the satisfactory announcement that it was no longer necessary for British automobile engineers to go abroad for any of the raw material or component parts used in the construction of motor-'buses, everything being now obtainable in this country. Steel manufacturers, in particular, had, he mentioned, shown great enterprise of late in catering for the requirements of the automobile industry. Mr. Norris also recounted some interesting reminiscences of his early connection with the motor-car movement, while Mr. Geo. W. Grimshaw referred to the celerity with which the new 'bus had been put through. The designs of the vehicle were only commenced early in December, but by a great effort they had managed to complete the first machine

the home production were absolutely unreliable. Our opinion has since proved to be well founded, for it has transpired that the values given were largely estimated ones. A striking instance as to how wide of the mark these estimates were has just been brought to our notice by Mr. E. Lisle, sen., of the Star Engineering Company. Mr. Lisle was among those who did not see his way to make public to a competitor the extent of his output, and informs us that the figures credited to his company as the estimated value of their production of Star cars in January last were about equal to the actual profits of the month!

ON Tuesday last, at the Show at the Agricultural Hall, Messrs. R. Reynold Jackson and Co. duly dismantled the little Jackson dogcart which had covered over 15,000 miles at a very small cost of upkeep. The proceedings created much interest, and the excellent condition in which the change-speed gears and bevel pinions were found was not only a matter of considerable satisfaction to Mr. Jackson, but made a great impression on motorists of moderate means. We understand that the car is to be put together again for further daily use during the ensuing year, when, at the 1907 Cordingley Show, its internal condition will again be publicly inspected.

## CONTINENTAL NOTES.

### The "Elastic" Wheel Competition.

The "elastic" wheel competition which the "Auto" proposes to hold in France from the 17th to the 26th inst. promises to be of an interesting character, an excellent list of entries having been obtained, as will be seen from the following:—

Entrant.	Type of Wheel.	Car on which same is fitted.
Yberty and Merigori	Elastic Tyre	16-h.p. Decauville.
Ducasble	Ducasble Tyre	14-h.p. De Dion.
Le Securitas	Metallo-Elastic Tyre	16-20-h.p. Lue-Court.
Amelot	Wheel with double rim and springs between	Martin-Lethimonnier.
Hallé	Spring Wheel	35-h.p. Gobron.
Soleil	Cushion Hub	20-h.p. Renault.
Spherola	Spring Wheel	Not yet stated.
Cadignan	Spring Wheel	16-h.p. Boyer.
Hallé	Spring Wheel	24-h.p. Rapid.
Coaset	Spring Wheel	30-h.p. G.V.R.
Edmond Leri	Spring Wheel	24-h.p. Dietrich.
Garchey	Enclosed Rubber Tyre	24-h.p. De Dion.
Monnin-Damidot	Spring Wheel	Not yet named.

It will be seen from the above that two British productions are taking part in the trials—the Spherola and the Hallé.

### Another French Touring Exhibition.

The Moto-Club de Cannes is organising a touring motor-cycle competition for Sunday next, the 8th inst. The course is

A Motor Meet on the Lauteret, Dauphiné, France, 6,800 feet above sea level.

from Cannes to Grasse and back, *via* a 200-kilometre circuit. There will be classes for motor-cycles and tri-cars, and a minimum speed of 15½ miles per hour will be required.

### An Inventors' Exhibition.

Considerable interest is being shown in the Exposition des Petits Inventeurs, which was opened in Paris on Saturday last. Walking round the Show one comes across many interesting little novelties, among which may be mentioned a honeycomb radiator, which can be readily dissembled, shown by M. Choppy, and an instantaneous fixing for tyre inflators, by M. Lhuillery. Several new spring wheels, change-speed gears, shock absorbers, and syrens are also to be seen, among the latter being one which emits a sound that can be heard at a distance of over a mile.

### Miscellaneous Items.

A reliability trial of industrial motor vehicles is to be held by the Automobile Club du Nord de la France from the 7th to the 13th June next.—Twenty-one entries have so far been received for the Circuit Européen, the British contingent including a Wolseley and three Daimlers.—The Moto Club of Como is organising a motor-cycle race from Milan to Como for the 27th inst.

## HERE AND THERE.

AMONG the visitors to the Show last week was M. Jenatzky, the winner of the Gordon Bennett race in 1903.

THE A.C.G.B.I. badge is now being allowed to be used as an armorial bearing without licence duty being paid.

THE London County Council has just placed an order with Messrs. Merryweather for a third motor fire engine.

SOUTHAMPTON WATER will again be the scene of the Reliability Trials of the Motor Yacht Club. These will take place in July.

THE new underground trams from Kingsway to the Angel were a great convenience to many visitors to the Agricultural Hall Exhibition.

COPIES of the catalogue of Cordingley's eleventh motor-car exhibition can be ordered through any newsagent, bookseller, or railway bookstall.

MESSRS. DAYRELL AND GROOMBRIDGE, makers of the Dagro accumulators, have removed from Forest Gate to the Uxbridge Motor Garage, Uxbridge.

"So far as novelties go," says Mr. E. Campbell, writing in the "Morning Leader" with regard to the Cordingley Show, "I think it is admitted that there are actually more on view than was the case at Olympia."

IN connection with the Show the Lancashire Steam Motor Company, Limited, issued a handy little book in which visitors to the Commercial Vehicle Section might make notes and sketches of any item of interest to them.

THE Darracq Proprietary Company, Ltd., has been registered with a capital of £75,000, to acquire the land, premises, fixtures and fixed plant at Suresnes, belonging to A. Darracq and Co., Ltd. (incorporated in England in 1903).

THE Cardiff Watch Committee have accepted a tender for the supply of an 18-20-h.p. motor ambulance by Messrs. Straker and McConnell. The price paid by the authorities includes the training of a man to drive and manage the vehicle.

THE Federation of American Motor Cyclists has decided to offer three medals for mileage and touring this year. The medals will be awarded to the motor-cyclist visiting the greatest number of counties in the United States between April 1st and November 30th next.

A NEW soap for cleansing the hands of motorists has been introduced by the "K.C." Soap and Polish Company, Ltd. The active ingredient is a saponaceous earth, and it is entirely free from deleterious matter. In this preparation there is evidently high merit, and to motorists who have had difficulty with their hands the K.C. soap is to be commended.

THE Central Insurance Company, Limited, have issued a neat card of cautions to drivers for the prevention of fire, in a form sufficiently attractive to be hung in the garage. Among the nine important warnings is one not to be lightly disregarded, viz., "Put all cotton waste into a bucket or other metal receptacle provided for the purpose, and do not allow it to accumulate."

REFERRING to the non-stop run recently made by the Maudslay bus from Coventry to Edinburgh, it is of interest to know that the vehicle was fitted with the Hopkinson patent solid tyre. Several motor-buses had previously been despatched on similar non-stop runs from the Maudslay works, all of which were successfully accomplished without tyre troubles of any kind occurring on the journey.

A GOOD story is going the rounds of motoring circles. A new addition to the ranks of automobilists had purchased a Talbot, and had given instructions that it should be driven down to his residence on completion. When the happy news came that it had been despatched the owner prepared for a trial trip. But the car was somewhat late in turning up and the owner inquired the cause. "Well, I had a cylinder missing at the start, and—" "A cylinder missing? Why the — didn't they put in all the cylinders, I paid full price for the car!"

THE Wheel Construction Company, Ltd., has just been formed.

THE authorised capital of the Monde Motor Company is £1,000.

MESSRS. S. F. HEATH AND CO., of Birmingham, have opened up a new garage in Worcester.

THE nominal capital of the United Motor 'Bus Company, which was registered at the end of last month, is £100.

"MOTOR NOTES" are a regular feature of the "Madras Times" and other newspapers published in India and Ceylon.

The 20-28-h.p. Spyker Car built to the order of Mr. E. W. Casares for shipment to South America. It is fitted with a special six-seated Landaulet body by Meier, of Redhill.

MR. CHARLES JARROTT hopes to drive from London to Monte Carlo—excepting, of course, from Folkestone to Boulogne—in 48 hours.

MR. H. WAYMOUTH PRANCE, A.I.E.E., has commenced practising as a consulting automobile engineer at 39, Westbourne Gardens, Bayswater, W.

WITH a capital of £60,000 the Autoloc Syndicate has been formed to acquire the British patent for the Autoloc, which was one of the novelties at the Show.

THE New Leader Cars, Ltd., is the title of a company formed with a capital of £75,000 to acquire the business carried on by New Leader Motors, Ltd.

MR. MAX GRADDON is making a special feature of motor coach work at the Mildmay Motor Carriage Works, Mildmay Avenue, Newington Green Road, N.

A GARAGE has been established at the Royal Hotel, Leamington, the charges in connection with which are on a sliding scale, commencing at 3d. for motor-cycles, 6d. for cars up to 20-h.p., and 1s. for cars beyond that power.

MR. J. C. MITCHELL, who was lately with Messrs. Friswell, Ltd., has commenced business as motor salesman, auctioneer and valuer at 61 and 62, High Street, Shaftesbury Avenue, London, W.C., under the title of James C. Mitchell and Co.

MESSRS. H. ANDREW AND CO., of Athenæum Place, Plymouth, have recently enlarged their premises, so that they have now accommodation for fifty motor-cars. Their garage has been appointed the head-quarters of the South Devon Automobile Club.

WE learn that the Rykniel Engine Company, Limited, Burton-on-Trent, have decided to confine themselves entirely, for the present, to the manufacture of heavy motor-bus chassis. These will be in general similar to those supplied towards the end of last year to the Leeds City Tramways; but they have been improved and simplified in several respects, and also reduced in weight.

THE Clincher Motor Tyre list for 1906, just issued by the North British Rubber Company, Limited, is a well-prepared production, complete with regard to tyres and their accessories. In addition to the usual information concerning covers, inner tubes, etc., there are particulars and illustrations of the Clincher handy case fitted with repair outfit—a particularly useful speciality of which the touring motorist should take note.

THE Crown Prince of Germany has just ordered a 70-h.p. Mercedes car; it will be fitted with a six-seated touring body.

THE offices of the Societe des Automobiles le Passe-Partout are at 84, Bishopsgate Street Within, E.C. The capital is £6,000.

A NEW motor depot is being opened in the Kingston Road, Raynes Park, London, S.W., by the Dorian Motor and Cycle Company.

THE Baldwin Locomotive Works, of Philadelphia, have purchased a Winton car in which to carry visitors to and from their factory.

THERE will be no initial public issue of the British Mercedes Motor-Car Company, which has just been registered with a capital of £100.

THE Belfast Marine Motor Company, Ltd., has offices at 38, Waring Street, Belfast, and has been registered with a capital of £1,000.

WITH offices at the Belfast Chambers, Beak Street, London, W., the Motor Delivery Company has been registered. The capital is £5,000.

IN the annual report of the Fire Brigade Committee of the L.C.C., brief reference is made to the experiments with motor traction now being conducted.

THE Validus detachable non-skidding and unpuncturable band has just been put upon the market. This is rigid and does not creep on the tyre. It is easily adjustable and does not wear the tread of the latter, there being no metal resting on the cover of the latter. The rivets are only fitted through the renewable tread, and although there is a thickness of leather between the tyre and the backs of the rivets, no great weight is added to the wheel by the adoption of the Validus device.

A Delaunay-Belleville car ascending Girdner Street, Glasgow, a well-known hill with a continuous gradient of one in six. The Barlington Carriage Co., Ltd., inform that the same car had previously ascended Balmain Brae, another noted Glasgow hill, with fourteen persons on board.

GREATER efficiency is claimed for their engines by the Austin Motor Company, by the adoption of a device which allows of equal expansion to the cylinder. The majority of cylinders are, as a rule, cast in one with their water jackets, but in this instance a novel method is brought into use. The bottom of the cylinder water jacket is left open, and between this and the cylinder proper is screwed a cast iron ring, having on its inner face, and grooved into it, a Dermatone washer, which expands as it is forced into position. Whilst making a perfect water-tight joint, it also allows the walls of the cylinder to expand and contract at will.

## The Cordingley Show.

[Continued from page 101.]

ON Saturday last the 'Agricultural Hall closed its doors on the eleventh of Cordingley's Motor Shows. From the spectacular point of view it was, according to the daily press, a triumph, and congratulations were sincere and universal. That business was brisk throughout the week was evident from the anxiety of many of the leading firms to secure the same positions for next year's Exhibition. Our report is continued below, and we would remind readers who were unable to visit the display that catalogues can still be obtained from the office of the M.C.J.

### The Savage Steam Wagon.

Messrs. SAVAGE BROS. had on view two steam wagons, one with locomotive type boiler and one with water tube boiler. The Savage

working at 200 lbs. per sq. in. It can be fired either from the top or the left hand side, and a noteworthy feature is the provision of a hand hole for cleaning the scale and mud from the fire-box crown plate. The feed arrangements, engine, and gearing are all similar to the other wagon, but a rocking forecarriage is fitted to secure three point suspension. The wheels of the wagon are of wood, of the artillery pattern. This wagon has had mounted on the frame immediately behind the driver's seat, a combined lighting set, consisting of an engine similar in all respects, except its vertical position, to the driving engine, and directly coupled to it a 30 kilowatt dynamo, giving 130 amperes at 65 volts. This engine was running during the exhibition and lighting several electric lamps; it should be very useful to travelling showmen, or for search light apparatus.

A General View of the Show as it appeared on Sunday morning last.

water tube boiler is well known, having two drums, a water drum and a steam drum, connected by 120 tubes of 1 in. diameter. The peculiar shape of these tubes materially assists circulation, and the heating surface amounts to 110 square feet. The grate area is 3 feet. The exhaust passes through a feed water heater under the foot-plate, and the feed is provided by an automatic pump, gear driven off the crank-shaft, and by an independent donkey pump of the Morse type. The engine is compound, with cylinders of 4 in. and 7 in. diameter by 5 in. stroke, and is mounted horizontally under the wagon body. The high pressure cylinder has a piston valve and the low pressure an ordinary slide valve, actuated by a single, eccentric reversing gear. The final drive is by roller side chains from the differential countershaft. The engine and gears are all in an oil-bath, but the chains are unprotected. The spring ends slide on brackets, and the brake blocks are applied to both sides of the driving wheels, so as not to put any strain upon the axle. The wheels are built up of steel plates dished at the centre, and riveted to circular angle irons at the rim. The second wagon, which was staged at the further end of the Minor Hall, is provided with a locomotive boiler, fitted with unusually large tubes, 2 in. diameter, and

### The Ellis Steam Wagon.

Messrs. JESSE ELLIS AND CO., LTD., had on view a 5-ton steam wagon, with sanitary tipping body and watering tank. This firm have introduced the system of fitting the watering tank inside the body, so that, instead of changing bodies when required to be altered from scavenging work to street watering, the tank can be slung in complete with all attachments. The vehicle has attracted considerable attention from local authorities, and has been adopted in several districts on account of the economy that is shown over the use of horses for these purposes. The boiler fitted to the exhibition wagon is of the vertical smoke tube type, the tubes being curved and the top tube plate sunk below the water level, so that the tubes are never uncovered. The engine is a compound with cylinders 4 in. and 8 in. diameter by 6 in. stroke. Ordinary link motion is used, and the slide valves are balanced. The engine is enclosed in an oil bath and the transmission is by spur gearing, all of which is machine cut from steel blanks. The differential is on the live back axle, which is 4 1/2 inches in diameter, reduced to 3 1/2 in. at the journals. Stevens' patent compensating bar is employed to equalize the load on the back axle springs, and to ensure that the axle always moves parallel to the second motion

shaft, and that the gear wheels are equally deep in gear. This wagon is fitted with a steam tipping gear worked from the flywheel of the driving engine. A bevel spur wheel is attached to the flywheel, and a bevel pinion on the tipping gear can be brought into mesh with this when required. When the wagon reaches the unloading berth, the engine is thrown out of gear with the road wheels and the bevel is put into gear with the tipping apparatus. Much time can be saved by the use of this appliance.

#### The Sentinel Steam Wagon.

Messrs. ALLEY AND MACLELLAN, LTD., were showing a new sixteen "Sentinel" steam-wagon chassis. The design of this vehicle is quite original, and there are many points that well repay careful study.

Fig. 37.—Sectional View of "Sentinel" Boiler.

without unshipping the boiler, provided, of course, that the wagon is standing over a pit of sufficient depth. In this way every portion of the fire-box plates and the water tubes can be cleaned free from scale. The boiler is fired through a central shoot, and instead of the usual ashpan damper door the whole ashpan is hinged at one side and lowered from the other, so as to regulate the draught. The boiler works at 250 lbs. pressure, and contains 61.3 square feet of heating surface. The feed is by automatic pump driven off the end of the crank-shaft, and by a Gresham and Craven injector. The engine is not compound, but has two equal cylinders, 6½ in. diameter by 10 in. stroke, the cranks being set at 90 degrees. The valve gear is similar in principle to that of a petrol engine, as a cam shaft passes underneath the cylinders and operates mushroom poppet valves, separate valves being used for admission and for exhaust, and, by moving the cam shaft axially, the cut off can be varied to give different degrees of expansion. The whole of the motion work and the cam shaft run in oil, in a

Fig. 38.—Section and Elevation of Front Wheels of "Sentinel" Motor Wagon.

dust-proof casing. The unusual dimensions of the engine have enabled the makers to dispense with a second-speed gear, as all variations of power and speed can be obtained by the throttle valve. The latter again is quite novel, the main regulation of the steam being by a stop valve, for, on turning the handle at the top, the valve is raised off its seat, but the orifice through which the steam passes can be instantly closed by a foot lever. In practice the driver regulates the

Fig. 39.—The "Sentinel" Sixteen Steam Wagon.

In the first place, the boiler (Fig. 37) is of the vertical cylindrical type with a square fire-box, crossed by forty-eight inclined water tubes. All these tubes are in the lower part of the fire-box, well below the water level, so that there is no chance of uncovering them even on the steepest inclines. The sectional view shows the water line on a gradient of one in six, which will make this point quite clear. The sixteen central water tubes are stouter, so as to act as stay tubes, and the upper part of the fire-box contains a superheater coil ensuring absolutely dry steam. The fire-box can be taken out by unbolting two flange joints, one at the top and one at the bottom, and removed

pace and power of the wagon by the hand stop valve, but any slow down or stoppage for traffic purposes is effected by depressing the pedal without taking his hands off the steering wheel. The drive is transmitted from the crank shaft to the differential on the live back axle by a roller chain. The differential can be locked by a catch on the off side driving wheel. The wheels are composite, with cast-steel centres and built up wooden felloes, and the front wheels (Fig. 38) have been dished so as to get the pivot on the centre line of the wheel tread. With this arrangement there is no tendency to turn when the wheel strikes an obstacle, and

load on the coupling rods and steering rods is reduced to a minimum. The steering is operated by a screw and nut working in an oil bath. Throughout the wagon special material has been used, and great care exercised that the proportions are ample. Before putting the "Sentinel" steam wagon on the market, the makers have subjected it to severe tests, and careful observations have been made of its performance. They are assured that it will give satisfaction in regular work with six ton loads on its own deck and an additional four tons on a trailer, ten tons in all, with which loads they have climbed gradients as severe as one in eight.

#### The Wellington Steam Tractor.

The tractor exhibited by Messrs. WILLIAM FOSTER AND CO., LIMITED, was a standard Wellington machine of the five-ton size. It is designed on traction engine lines, with locomotive boiler working at 210 lbs. per square inch, the feed pump being driven off the crank shaft by a 2 to 1 reduction gear, and a White injector is also fitted. Special provision is made for cleaning, in the shape of a hand hole in the fire-box casing, level with the crown of the fire-box, and another at the top of the smoke-box tube plate. The engine is a two-crank compound, with slide valves on the top of the cylinders, operated by ordinary link motion, and an auxiliary valve admits steam to the low-pressure cylinder for ease in starting. The tractor shown had "Gare" resilient wheels for both steering and driving. These wheels have given great satisfaction to all who have tried them, as they not only silence the engine, but they also greatly reduce wear and tear, by stopping the vibration that steel wheels transmit to the whole engine. They also make a speed of twelve miles per hour legal, when a trailer is not drawn, instead of the five-mile limit. A built up steel wheel off the traction-engine type was also shown. The manufacturers have given special attention to the water capacity, and large tanks are carried on either side, in addition to the tender tank. These side tanks are chamfered off along one vertical edge to allow plenty of room for the front wheels when in full lock. A patented arrangement is employed for the spring suspension of the back axle, whereby only one cross spring is employed, but the axle is bound to always move parallel to the other shafts.

#### The Stepney Spare Wheel.

Recent reports in our columns, notably that of Mr. R. M. Wright's run from Lincoln to London, have familiarised motorists with the advantage of the Stepney spare motor wheel which was shown by Messrs. DAVIES BROS. The device is really a skeleton wheel with inflated tyre spokes, with suitable arrangements for securing it to the iron flange or bead of the punctured car wheel. The fixing of this spare wheel is so easy that by simply screwing up two fly-nuts with the fingers it is made secure, thus enabling the motorist to continue his journey without any delay or inconvenience, nor damaging the deflated tyre, which remains in position on the car wheel, and can be repaired at leisure.

#### The St. Pancras Steam Wagon.

THE ST. PANCRAS IRON WORK COMPANY, LTD., exhibited a standard 5-ton steam wagon (Fig. 41), fitted with an entirely new

Fig. 40.—Section of St. Pancras Boiler.

boiler of novel design. It will be seen from the section illustrated that it is a vertical boiler fitted with horizontal tubes. There is a large central fire-box fired from the top through a central shoot, and at the bottom of the shoot is a baffle plate riveted to the fire-box plate, which completely cuts off the upper part of the central space from the fire-box. The products of combustion pass outwards through the lower eight rows of tubes to an annular smoke-box, and are returned inwards through the seven upper rows of tubes to the central space above the

baffle plate, from whence they rise to the funnel. The water level is well above the top row of tubes, even on a considerable incline. Advantage is taken of the position of the baffle plate to make it into an exhaust steam superheater, from which the exhaust is finally emitted through a nozzle in the base of the funnel. The casing or annular smoke-box is provided with doors so that all the tubes can be properly swept, and the top cover plate of the boiler can be unbolted to clean the outside of the tubes. The working pressure is 220 lbs. per sq. in., and the heating surface 93 sq. ft. The engine is horizontal, with compound cylinders  $4\frac{1}{2}$  in. and 7 in. diameter by 6 in. stroke. It is fitted with link motion actuating D slide valves. There is a central bearing to the crank-shaft, all the bearings being lined with phosphor bronze brushes. The drive is

Fig. 41.—The St. Pancras Steam Wagon supplied to the N. E. Ry. Co.

by spur gearing to the differential countershaft and thence to the back wheels by Renold roller chains. The engine and gearing run in a large oil bath under the wagon body. A rocking fore-carriage gives practically three point suspension to the vehicle, and the road wheels are of cast steel.

#### The Hindley Steam Wagon.

Messrs. E. S. HINDLEY AND SONS exhibited two steam wagons, one each of the five and three-ton sizes. The larger wagon, which is fitted with a covered van body, is one of a repeat order for Pickfords, Limited, the total orders placed for this make of steam wagon by these well-known carriers amounting to seventeen wagons. This is a standard five-ton wagon chassis, fitted with a boiler of the stayless locomotive type patented by this firm. The fire-box and outer fire-box shell are both circular, and the shell is carried up considerably higher than the top of the boiler barrel, so that the barrel is always full of water, and the tubes and fire-box crown are entirely submerged, even on the steepest inclines. The firing is effected from the top, through a central tube in the fire-box crown plate, and ample heating surface is provided. The steam is led to a compound horizontal engine, slung under the wagon body. A piston valve is used for the high pressure, and a balanced D slide valve for the low pressure, actuated by ordinary link motion, which is enclosed with the crank shaft in an oil bath. The transmission is by spur gearing, all the gear wheels being of great width and moderately short pitch, so as to run silently and smoothly. Two speeds are provided, and correct alignment of the back axle and second-motion shaft, with the crank shaft, is ensured by three plate links. The differential is on the live back axle, and is made so that it can be readily locked, should one of the wheels slip on a greasy road. A water tank of 180 gallons capacity is slung from the back end of the frame, and an automatic pump and injector provide for the boiler feed. The back wheels are 3 ft. 8 in. diameter by 10 in. wide, and the front wheels 2 ft. 10 in. diameter by 5 in. wide. They are built up of dished steel plates, but "Gare" or artillery type wooden wheels can be fitted if desired.

The three-ton wagon is a tipping wagon built to the order of Messrs. G. E. Maloney and Co. The boiler is of the same design, and differs only in dimensions from that on the larger wagon. The engine, however, is vertical, slightly inclined, and is mounted immediately behind the boiler, and above the frame. The change-speed pinions are on an extension of the crank shaft, and drive a short second motion shaft on the right hand side under the fore part of the body. From this the power is transmitted by a stout roller chain to the differential on the live back axle. The position of the engine and gear permits of a water tank immediately over the back axle, giving a much better distribution of weight than usual, and allowing an unusually large capacity tank. The tipping gear can be operated from either side.

#### The "Grose" Band.

The well-known "Grose" band was shown in the Gallery. In this the chrome leather band is formed into the exact curve of the tyre it is intended for, thus ensuring a neat appearance. The whole of the tyre is covered with leather, completely over the beaded edges, so that the band actually strengthens the tyre on which it is fitted, and prevents it from bursting above the beaded edge. This arrangement has also the advantage of preventing the damp penetrating to the tyre. Between the rubber tread of the tyre and the band an intermediate leather is placed protecting the former from any possibility of damage from the ends of the rivets. Without interfering with the resiliency of the tyre or the speed of the car, the "Grose" band has much to commend it to motorists.

**The Mann Steam Wagon.**

MANN'S PATENT STEAM CART AND WAGON COMPANY, LTD., exhibited a standard pattern steam wagon, fitted with flat platform body. This firm was one of the first to manufacture steam motor-wagons, and have from the first adopted locomotive type boilers and an all-gear drive. Though improvements have naturally been introduced from time to time, these fundamental details are still retained in the exhibition wagon. The boiler has been altered by shortening the tubes and barrel, but increasing the number of tubes and the diameter of the barrel. The

Fig. 42.—The Mann Winter Wheel for Motor Wagons.

firing is still done from the side, but the door is placed near the top of the fire-box, so as to allow of a deep fire, and not too frequent stoking. The working pressure is 180 lbs. per square inch, the heating surface 80 square feet, and the tubes, fifty in number,  $1\frac{1}{2}$  in. in diameter. The feed pump is placed on the outside of the plate frame, on the left hand side, and is driven through a reduction gear from the crank shaft. An injector is also fitted, and a duplex safety valve is mounted on the steam dome. The engine, of the compound horizontal type, has cylinders  $4\frac{1}{2}$  in. and  $7\frac{1}{2}$  in. diameter by 7 in. stroke, with a single eccentric reversing gear, actuating plain slide valves. The boiler forms part of the main frame, and it is extended back by steel plates riveted to the back of the boiler and forming the side sheets of the oil bath, and also of the water tank. The whole of the motion work and of the gearing is enclosed in this oil bath. All the gear wheels are fitted on to square shafts, thus avoiding the trouble and weakening caused by key ways; they are all machine cut from cast steel blanks. The fast and slow pinions are on the crankshaft, and the differential is on the back axle, which is therefore a live axle. Steel plate wheels were fitted to the exhibition wagon, but Mann's winter wheel, Fig. 42, with wooden tread, can be fitted. The front axle is centre-pivoted, but has a positive steering gear, a worm operating a worm quadrant on the upright stem. In addition to the usual tyre brakes there is a band brake on the second motion shaft, operated by a pedal on the foot-plate. The body or platform is supported at the front end, and again on the top of the water-tank, and therefore has its own frame quite independent of the engine frame.

**The Burrell Steam Tractor.**

Messrs. CHARLES BURRELL AND SONS, LIMITED, exhibited a steam tractor that is somewhat different from the usually accepted type. It follows the lines of the Burrell traction engines. The locomotive boiler, with single cylinder mounted on the boiler barrel, and motion work over the top of the fire-box, are common to all steam tractors; but in this case the fast and slow pinions on the end of the crank shaft drive direct on to the differential, and the two road wheels are driven independently, by separate pinions, on either end of differential countershaft, driving spur wheels secured to each road wheel. This makes a much easier drive, and also lends itself to the introduction of a device for instantly locking the differential gear from the foot-plate, directly one wheel begins to slip. The steering gear is also special to the Burrell engines, as, instead of the worm shaft and chains, a positive gear is introduced. The steering shaft ends in a worm which operates a worm wheel keyed to the top end of an upright shaft, on the bottom of which is a spur pinion meshing with a spur wheel bolted to the fore-carriage centre. This steering gear is quite irreversible, and cannot be snatched out of the driver's hand. When the constant working on a small sector of the spur wheel leads to wear and back-lash, the spur wheel can be turned round through 60 degrees and present a fresh portion for service. A special fly-wheel brake, operated by a wheel and screw from the foot-plate, provides an extra control over the engine. Large water tanks are provided, slung under the boiler barrel, and a winding drum is carried between the spur wheel and road wheel, on the left side of the engine.

**Motor Oils and Greases.**

As usual, the STERN-SONNEBORN OIL COMPANY had an attractive stand from which to introduce their specialties to the many prospective as well as actual motorists visiting the Exhibition. Oils for water and for air cooled cylinders were here shown, as well as motor greases and lubricants generally, the repute of these having been long established in the automobile world. These oils are entirely free from acids, gummy substances, and other impurities, while another factor of excellence is the absence of animal or vegetable matters. The cylinder oils are characterised by extremely high flash points, and will not carbonise at any temperature to which they are likely to be subjected. A new preparation just brought out by the Stern-Sonneborn Oil Company is a non-freezing liquid to supersede water in the cooling of engines. It has the merit of not depositing lime or other impurities in the pipes, jackets, or radiators, and is also non-corrosive. Soluble oils for engineering purposes were also to be seen at this stand.

**The Robertson Steam Wagon.**

MESSRS. J. ROBERTSON AND SON exhibited a standard steam wagon with hydraulic tipping gear. It is fitted with their patent tubular boiler, in which the tubes are disposed radially from a central fire-box to an outside circular casing which fulfils the function of a smoke-box. The tubes, which are 272 in number, are slightly inclined to the horizontal, and present 77 ft. of heating surface, the fire-box providing a further 3 ft. The boiler works at 200 lbs. pressure and is fired centrally from the top, and the grate can be lowered for cleaning. The exhaust steam from the engine passes through a feed water heater which heats the water to 190 degrees Fahrenheit, and the feed is by means of automatic pump gear-driven from the crankshaft, and by an independent steam pump. The engine is compound, mounted horizontally under the wagon body, the cylinders being  $4\frac{1}{2}$  in. and 7 in. diameter by 5 in. stroke. All the motion work is enclosed in an oil bath, ordinary link motion being employed to operate solid piston valves without rings. The change-speed pinions and the differential are enclosed in an oil bath, and the final drive is by roller chains from the sprockets on the differential countershaft to the back wheels. An improved arrangement has been introduced for locking the differential, consisting of a claw clutch on the left-hand end of the differential shaft, a most useful device to enable a driver to get out of a hole, or when one wheel is slipping on a greasy road. The back axle is of H section, the axle arms having a cut down them so that half goes on either side of the web of the girder, and then both halves are securely riveted together through the web. Both driving and steering wheels are Stag's patent with cast steel pocket rims and hubs and wooden spokes. The steering gear is in a dust-proof aluminium casing, and the hand brake is of the internal expanding type, acting on the inside of the large chain sprockets. The wagon is fitted with an hydraulic ram to tip the body, worked by the Moore

Fig. 43.—Front and Side View of Section of Robertson Steel Wheel with Twin Renewable Tyres.

steam pump, which also feeds the boiler. A model of a new design of driving wheel (Fig. 43) was also shown on this stand, in which provision is made for taking up the increase in the diameter of the tyre, which is usually known as "rolling out." The wheel centre is cast steel, on which are wooden felloes bedded on half an inch of rubber. The tyres are made in two halves, making practically twin tyres, which detail by itself reduces side-slip. The edges of the felloes are slightly bevelled and the inside of the half tyres are similarly inclined, so that as they roll out the two halves can be drawn together by the bolts that pass through the felloes and through square lugs on the tyres. It will also be noticed that there are claws cast on the wheel centre to transmit the drive to the lugs on the tyres, and to prevent any creeping of the tyre relative to the felloes.

**The Allchin Steam Wagon.**

Messrs. WILLIAM ALLCHIN, LIMITED, exhibited a five-ton steam wagon, with a lorry body having hinged sides. The locomotive type of boiler has been adopted with the fire-hole on the right hand side. There are sixty-five tubes of 1½ in. diameter, and the smoke box projects beyond the front of the wagon. The barrel is surmounted by a dome, on which the safety valves, set to 200 lbs. per square inch, are mounted. The engine is of the compound type with cylinders 4½ in. and 7½ in. diameter by 6 in. stroke, placed horizontally under the body. D slide valves are used, operated by link motion. All the motion work and gearings are enclosed in oil-tight casings. The change-speed wheels are mounted on an extension of the crank-shaft, and drive on the differential, which is on the second motion shaft, from which the power is transmitted to the

Fig. 44.—The Allchin Steam Wagon.

road wheels, by 1½ in. roller chains. The chains are entirely encased, so that much of the objection to side chains, arising from the wear due to mud and dirt, will be avoided. The fixed back axle is 3½ in. by 3½ in. deep, and the road wheels are of traction engine type, with hubs cast round the steel spokes, which are riveted to the irons, single in the case of the front wheels, and double on the back wheels. They are fitted with gun metal bushes, and the driving wheels are straked with wide diagonal plates. The front wheels are 2 ft. 10 in. diameter by 6 in. wide, and the back wheels 3 ft. 6 in. diameter by 10 in. wide. A very unusual form of main frame has been adopted, consisting of a deep plate, cut away where the material is not required, and carrying a rolled steel channel all along the top edge, and another short channel along the lower edge at the front end to carry the front spring hangers. Two water tanks are slung between the frames, a small tank at the front end and a larger at the back, with a total capacity of 220 gallons. The boiler feed is by an automatic pump, driven from the crank-shaft, and an independent steam pump. The exhaust steam is passed through a feed-water heater before it is led to the funnel.

**The B. and B. Steam Wagon.**

Messrs. BRETHERTON AND BRYAN displayed a 5-ton steam wagon (Fig. 45), of a new design now exhibited for the first time. Mr. Bretherton has had great experience as a user of both traction engines and steam wagons, and has embodied his experience in this vehicle. The designs were prepared eighteen months ago, and the first steam wagon was turned out twelve months ago, but the firm decided wisely not to put them upon the market until the pioneer wagon had had a prolonged test under ordinary working conditions. This vehicle, which was sold to Mr. H. H. Finch, the well-known wine and spirit merchant, has been working without a hitch, but the makers have noticed one or two minor details in which they could effect improvements, and have introduced these in the exhibition wagon, which will now be the standard pattern. The boiler is of the loco type, fired from the top, the annular space round the firing tube being utilized as a steam dome, to ensure dry steam. Mr. Bretherton was the original patentee of the top-fired loco boiler, which has been so largely adopted for steam wagon work. The barrel is comparatively short and contains thirty-nine tubes of 1½ in. diameter, providing 63 sq. ft. of heating surface, the fire-box and firing tube providing an additional 7 sq. ft. The working pressure is 180 lbs. per sq. in. The frame is secured to the back plate of the outer fire-box shell by gusset brackets, and is very stiffly braced. The engine is carried below the frame on the left-hand side and is of the com-

pound horizontal type. The cylinders are extremely large, viz., 5 in. and 7½ in. diameter by 9 in. stroke, and an ordinary link motion is employed to actuate D slide valves placed underneath the cylinders. The crank-shaft with the four eccentric sheaves is turned out of a solid forging, and the whole of the motion work is enclosed in an oil bath, at the same time that the glands are left very accessible for adjustment and repacking. The engine is so very powerful that the low gear is seldom required, and great economy can be obtained by driving with the reversing lever well notched up, and raising the steam expansively. The fast and slow pinions are on an extension of the crank-shaft, and gear with a large double spur wheel on the second motion shaft. On the other end of this shaft a pinion gears with another spur wheel, which contains the differential. The back axle closely follows traction engine practice, the differential coming outside the bearing, close up to the left hand wheel. The wheels on the show vehicle are cast steel, but wooden wheels can be supplied if preferred. The bearing springs to the back axle are spirals, which give very easy riding, and can be detached and replaced in a very few minutes. The axle boxes rise and fall between horn plates of very substantial construction, and a screw down tyre brake is fitted. The front axle is also of the traction engine type, turning about a centre pivot, and also oscillating on a pin, so as to provide three point suspension, but the steering is by a worm and worm quadrant, so that it is quite positive and irreversible. The vehicle is thoroughly workmanlike in all its details, and in appearance.

**The Granta Cars.**

The GRANTA MOTOR COMPANY exhibited two sizes of the Granta cars they have lately placed on the market. The vehicles follow the standard lines of live axle machines and appear to be of sound construction. The engine comprises four separate cylinders, 4 in. bore by 4½ in. stroke in the case of the 18-22-h.p. and 4½ in. by 5½ in. in the 28-34-h.p. model. The valves are mechanically actuated and the mixture is furnished by a special form of automatic carburettor. The clutch is of the leather-faced cone type, springs being introduced under the leather to allow of easy engagement.

The gear-box is adapted to give four forward speeds and reverse, actuated by a single lever working in a gate quadrant. Special attention has been devoted to the question of engine lubrication, this being effected by a small pump. Any form of side entrance can be fitted to the chassis.

Fig. 45.—The B. and B. Standard 5-ton Steam Wagon.

**The Westminster Cars.**

The WESTMINSTER MOTOR WORKS, LTD., had on view a 20-h.p. chassis which they have introduced to meet the demand for a reliable car at a moderate price. It is made in two forms, one having side chain transmission and the other a live axle. The engine comprises four separate cylinders 95 mm. bore by 120 mm. stroke. The valves are mechanically operated, and an oil pump driven off the cam shafts ensures the efficient lubrication of the engine. The transmission is through a leather-faced cone clutch and a gear-box giving three speeds and a reverse with a direct drive on top. Ball-bearings are fitted to all parts except the engine. The car has a wheel base of 10 ft. 2 in., which enables roomy side-entrance bodies to be fitted. The company, which has a garage conveniently situated in Westminster, is offering free storage for twelve months for users of their cars in the London district, and is also arranging for a monthly inspection of the vehicles during a similar period.

### The Stewart Steam Wagon.

Messrs. D. STEWART AND CO. (1902), LIMITED, displayed a five-ton steam wagon manufactured by them under licence from Messrs. Thornycroft and Co. In most of its features it is similar to the Thornycroft steam wagon, but there are several special Stewart details worthy of notice. The boiler is of the locomotive type working at 175 lbs. per square inch, and is fired through a central shoot over the fire-box crown. The engine is compound, with Joy valve gear, and balanced slide valves are used, placed under the cylinders. Instead of the fly-wheel in close proximity to the road-wheel, usually seen on Thornycroft wagons, the fly-wheel is close up to the crank chamber, and connection is made to a separate shaft, in continuation of the crank shaft, by a crossbar carrying two rollers which fit loosely into slots in the periphery of the fly-wheel. This not only allows for any want of alignment in the bearings, but also enables the portion carrying the fast and slow pinions to be taken down without affecting the engine. The second motion shaft is flexible, on the Thornycroft system, giving a gear drive to the live back axle. A novel feature is the introduction of a hydraulic brake acting on the back wheels. A small reducing valve can be worked by a pedal, and admits water from the bottom of the boiler to a ram cylinder over the back axle, which pulls on brake blocks on either side of each road wheel, thus avoiding any strain on the back axle. On releasing the pedal it returns by a spring, and releases the water, which is discharged on to the road.

### The Garrett Steam Wagon.

Messrs. RICHARD GARRETT AND SONS, LTD., were present with two vehicles, a 5-ton tractor and a 5-ton steam wagon. The tractor is of the standard pattern now manufactured by most of the well-known traction engine makers, it being thus only necessary to note the special points in its construction. It is fitted with Garrett's patent fire-box, in which the crown plate is both arched and corrugated, so that it requires no staying. It is provided with a single-cylinder engine, 5½ in. diameter by 9 in. stroke, and the back axle is mounted on laminated plate springs, the gearing being compensated by a special system. A large water tank is provided under the boiler barrel. The 5-ton wagon (Fig. 47) is very similar to that exhibited at the Agricultural Hall last year, but presents several features not to be seen in the practice of other manufacturers. The boiler is of the vertical fire-tube pattern, fired through a central tube from the top, and a clinker door is fitted in the side for cleaning the fire. All the tubes are entirely submerged, so that there is no risk of burning, and as the steam is not liberated from the water in the tubes

engine practice, and this can be effected from the foot-plate, in the same manner as the fast and slow gears. The engine, motion and gears are enclosed in an oil-bath, and the differential is of the planetary spur wheel type, instead of the more common bevel type. The engine, with the gear casing, is attached to the frame through a spring arrangement, which provides a virtually three point suspension. A foot lever is provided to actuate an extra brake on the differential countershaft, of the internal expanding type. The road wheels are cast steel, fitted with gun metal bushes. A tank is slung from the back of the tank carrying 160 gallons of water. The whole vehicle is of the high-class workmanship associated with the Leiston firm.

### The Pickering Omnibus.

THE PICKERING MOTOR AND WHEEL COMPANY, LTD., showed a double-deck omnibus with a 28-35-h.p. four-cylinder engine (Fig. 46).

Fig. 46.—Chassis of Pickering Motor 'Bus.

The inlet valves are placed over the exhaust valves, and are operated by tappets from the same cam shaft. Duplicate high tension ignition is provided, with separate sparking plugs for the magneto and the accumulator and coil. The special arrangement for maintaining the tension on the fan-belt, by means of a long lever and coil spring, is worthy of note. The gears are of the Panhard sliding type, providing three forward speeds and a reverse, and the final drive is by roller side chains. The brakes are all of the internal expanding type, the pedal brake acting on the driving sprockets and the hand brake on the road wheel sprockets. The steering gear is very substantial, necessitated by the large overhang of the front wheels, viz., 10½ in. from the pivot to the centre of the steering wheel. Pickering patent

Fig. 47.—The Garrett Steam Wagon.

but in the enlarged space above the tube plate level, much drier steam is obtained. The outer shell can be removed by unbolting two joints, so as to thoroughly clean out the scale at intervals. The feed is provided by an automatic pump, gear driven from the second motion shaft, and with an injector in reserve. The unusually high working pressure of 225 lbs. per square inch has been adopted. The compound horizontal engine, which is slung under the wagon body, is provided with a piston valve for the high pressure cylinder and a D slide valve for the low pressure, worked from a non-reversible single eccentric. The crankshaft, with the eccentric sheaves, is turned from the solid. The reverse is arranged by bringing an idle pinion into gear, on the same principle as in petrol

twin driving wheels are fitted, in which a double set of spokes are employed, which are staggered, so that the spokes lead from the rim alternately to the outer and the inner half of the hub. This makes a very strong form of wooden wheel, specially suited for omnibus work.

Messrs. L. RENE AND CO., LIMITED, had a comprehensive display of sparking plugs, voltmeters, amperemeters, and electrical accessories generally, the large show of the latter including a new pattern voltmeter of Bonbonnier form, supplied on very reasonable terms. A neat charging set and portable inspection lamp were also exhibited by Messrs. Rene and Co., on whose stand were the Shamrock-Premier tyres for cars and motor-cycles.

### Motor Vehicle Wheels.

Introduced at these exhibitions a few seasons ago, the Gare patent tangent wheels have become well known to all engaged in the automobile industry. A foe to side-slip, this wheel has found favour with those intimately associated with the development of motor traction in the public service, and is being largely adopted on motor omnibuses, heavy motor wagons, tractors, and the like. The principle of the Gare patent resilient motor wheel is that the spokes are placed tangentially to the hub, thus preventing shock being conveyed to the axle. At the outer ends the spokes are cut wedge-shape instead of the usual "tang," and the felloe is cut so that each end rests on the wedge face of the spoke. Between the two faces a piece of sheet rubber is cemented so that the outer portion of the wheel is completely insulated from the inner part. The tread is formed with blocks of rubber, fibrous rubber and wood impregnated with rubber making a soft and elastic surface, as well as one that is non-skidding and durable. It is calculated that a vehicle fitted with this wheel secures an increase of nearly 50 per cent. in efficiency. The Gare wheel is placed on the market by TANGENT WHEELS, LIMITED, who are also introducing it as adapted for lighter vehicles than those for which it was originally brought out.

### Improved Electric Vans.

IMPROVED ELECTRIC TRACTION, LIMITED, exhibited an electric brougham and a delivery van. Neither of these were fitted with batteries, so that there was no means of ascertaining wherein the improvement lay, but as the company has been formed to let out on hire all forms of electric vehicles at prices greatly below those current, there is evidently some novelty in the system by which expenses will be much reduced. The delivery van staged is to be let out at £5 per week, to include the driver, and the batteries will run from forty to fifty miles per day with 25 cwt. loads. The company are prepared to build special bodies to suit customers, in consideration of a sufficiently long contract. The fore part of the brougham has been constructed with much greater consideration for the driver's convenience than is usually the case with these carriages.

### The Churchill Char-a-banc and Delivery Van.

One of the attractions of the Show was the huge motor char-a-banc exhibited by Messrs. DURHAM, CHURCHILL AND CO., of Sheffield. The vehicle, of which we give an illustration in Fig. 48, is intended for

Fig. 48.—The Churchill Twenty-six-seated Char-a-banc.

a pleasure service between Girvan, Ballantrae and Colmonell, in Ireland; it has seating accommodation for twenty-six passengers, the rows of seats being arranged gallery fashion, so that everyone can have a clear view ahead. The motive power is supplied by a 24-30-h.p. "Aster" four-cylinder engine with two systems of ignition—high tension magneto and coil and accumulator. The transmission gear consists of a "Champion" friction clutch having metal-to-metal surfaces and a patent change-speed gear. Both of the latter we hope to illustrate in detail in a later issue. From the gear-box the power is conveyed by a universally jointed shaft to a differential countershaft, the latter carrying chain pinions which convey the power to sprockets fitted to the hubs and spokes of the rear road wheels. The "Champion" gear referred to above is an entirely novel mechanism giving four speeds and reverse, all changes being obtained by means of one lever. This gear is so constructed that the teeth of all the wheels are always in mesh and it is practically an impossibility for an inefficient or careless driver to damage the wheels in changing from one speed to another, a much-desired feature in the change-speed gear of any public service or commercial vehicle, where absence of repairs means increased earning power. The chain sprockets have very long bosses, which are lushed with phosphor bronze sleeves so arranged as to form oil reservoirs. The chains from these to the sprocket wheels are encased and run in an oil bath. The wheels are all shod with Sirdar tyres, 5 in. section twin tyres being used for the driving wheels and singles for the steering wheels. Special attention has been paid to the brake power, there being three different sets—a 4 in. wide contracting brake on the differential shaft, internally expanding

brakes, 18 in. diameter, working in drums attached to the rear wheel hubs, and emergency shoe-brakes on the back wheel tyres. A special feature of the char-a-banc is the seats, Fig. 49, which are made in accordance with Lee's patent, for which Messrs. Durham, Churchill and Co. are the sole licensees. The framing of these seats is rigid, but every passenger enjoys a separate hammock seat, which gives perfect freedom from vibration and road shock, while the back rest is carried by spring steel rods, the whole forming a most restful seat, which goes a long way towards the enjoyment of a long motor coach tour. These seats are well adaptable to all public service vehicles, as, in the event of only part of the number being occupied, all the others can be folded up clean and

Fig. 49.—Lee's patent Folding Seats for Public Service Vehicles.

dry. It does not take half a minute to fold up all the seats, after which a hose can be turned all over the vehicle without fear of wetting them. A "Churchill" light delivery van, designed for loads of about 10 cwt., and similar to the one which was illustrated in connection with our report of the recent Sheffield show, was also on view. The engine is a two-cylinder "Aster," giving 14-h.p. Three speeds and reverse are provided by an unusually large change-speed gear, the power being transmitted from this to a strong live axle by means of a universally-jointed shaft. The two shafts of the back axle are carried on ball bearings at their inner ends; they have only to convey the power and do not carry any of the load, the hubs of the rear wheels running on large plain bushes on the external tubes. On the stand were also shown examples of the Churchill steering and change-speed gears for cars and reversing gears for motor-boats.

### Motor Lawn Mowers.

The motor lawn mowers introduced by Messrs. RANSOMES, SIMS and JEFFERIES, LTD., continue to find favour, and a large number are in service in the Colonies as well as in the old country. At the Show the lawn mowers were shown in the three sizes in which they are made, viz., 42 in., 30 in. and 24 in. wide, the motors being of 6-h.p., 3½-h.p. and 2½-h.p. respectively. The two former have water cooled engines and the large mower is now fitted with an engine made at the Orwell Works, Ipswich. The motor has mechanically-operated valves driven off one camshaft. From this shaft the water circulating pump is gear driven. The high tension

Fig. 50.—Ransomes' Motor Lawn Mower.

magneto is driven by chains from the other end of the camshaft. An air-cooled motor is provided for the smallest size, a partially enclosed fan assisting the cooling. The drive is through epicyclic reducing gear, and subsequently by chains both to the rollers and cutters. The steering is direct on the small hind roller, throttle and air-levers being situated well within the reach of the driver. The larger machines are provided with a seat. A neat arrangement, operated through chains, allows the box to be cleared without stopping the machine. When it is required to use the machine only as a roller the whole of the fore-carriage can be removed.

**The Wallis Steam Wagon.**

Messrs. WALLIS AND STEEVENS, LIMITED, exhibited a standard 5-ton tractor and a 5-ton steam wagon. The Wallis tractor has become such an everyday feature of road traffic as hardly to require description, but the firm have steadily improved their machine with such great experience to guide them, and the exhibition tractor represents the last word on the subject. The compound engine has cylinders  $4\frac{1}{2}$  in. and  $8\frac{1}{2}$  in. diameter by 9 in. stroke, with link motion operating slide valves on the outside of each cylinder so that the steam chests are readily accessible. The whole of the motion is enclosed, together with the change-speed gears. The special feature of the boiler is the provision of a top row of four large tubes,  $2\frac{1}{2}$  in. diameter, the others being only  $1\frac{1}{2}$  in. diameter, and a smoke box damper which closes the small tubes but not the large ones, so that the fire does not become too dead. The 5-ton steam wagon is the first exhibited by this firm, and it is rightly described by the makers as their standard tractor put between shafts. The boiler, engine, and countershaft, together with the front axle and steering gear, is identical with that on the tractor. The channel frames of the wagon are riveted to plates secured to the fire-box shell plates, and are continued to the smoke-box, where they fit into brackets, but are not fastened rigidly to the latter, so that the boiler is free to expand independently of the channels. The drive is transmitted from the second-motion shaft by a Renold roller chain to the differential on the live back axle. The road wheels are of the traction engine type, built up with cast hubs, and steel spokes riveted to angle iron rims, and straked tyres. So completely are the tractor details retained that a shallow tank, corresponding in position to the tender tank, is to be found under the foot-plate, but is supplemented by a long tank between the frames over the back axle. A neat cab is fitted, and a very stout body with hinged sides has been fitted to the show wagon.

**The Lanchester Cars.**

THE LANCHESTER MOTOR COMPANY, LTD., occupied a large stand, on which were shown several of their latest 20-h.p. cars fitted with different types of bodies. The engine, which comprises four vertical separate cylinders, is placed in the front of the car, dividing the footboard between the driver's and the passenger's seats, thus giving better dis-

Fig. 51.—Sectional View of Lanchester Engine.

tribution of weight between the driving and steering wheels than if placed over the front axle, and permitting an ample side entrance body to be fitted without an unduly long wheel base. The crankshaft is provided with five bearings. The engine, which is carried on rubber buffers, has cylinders 4 in. in diameter by 3 in. stroke. It will be seen from Fig. 51, above, that while the cylinders are arranged vertically the valves are horizontal. The motor is exceedingly accessible, as when the bonnet is removed the engine presents a clean "broad side." The crank chamber forms an oil well, from which the whole of the engine is lubricated automatically under high pressure by a pump. Either low tension magneto or high tension by accumulators and coils can be fitted. The carburettor is of the Lanchester wick-saturation type; the speed of the engine is automatically controlled by a governor acting simultaneously on a separate throttle to each cylinder. The valves are mechanically actuated off separate cam shafts. The water circulation is on the thermo-siphon principle, no pump being used. The radiator is of special form, and is constructed from a number of flat cellular plates in which the cells run vertically. The clutch is of the multi-disc metal-to-metal type, and enables the driver to start the car on the top gear without shock to the passengers. Three speeds forward and a reverse are provided, the change-speed gear being of the epicyclic type and controlled by a single lever. From the gear-box the power is transmitted by worm gear to the rear axle. A patented arrangement is adopted for connecting the car frame to the under-frames. The ordinary type of carriage spring is departed from, and, instead of this, a single spring is used at each of the four suspension points acting on the cantilever principle; only half of the spring is visible in the ordinary way, the other half of the spring being concealed in the frame of the car body. The complete cars exhibited included a side entrance double phaeton, a four-seated landaulet, and a six-seated landau with unusually wide doors, the finish of which should amply maintain the reputation the Lanchester Company have built up for excellent carriage building, as well as high-class mechanical excellence.

**The "Billo" Change-speed Gear.**

An ingenious change-speed gear mechanism for use on motor-cars and boats was shown by Mr. T. W. DEANE, of St. Asaph, Wales. It is designed to give three speeds forward and a reverse, but the system can be adapted to any number of speeds. The pinions are always in mesh, the set on one shaft running quite loosely. The shaft on which these free pinions are mounted has a deep keyway groove, in which lies a long key, free to slide longitudinally in either direction. At a certain point

Fig. 52.—The Lanchester 20-h.p. Car.

in the key a specially-designed slot is formed, corresponding in size to small keys located in recesses in the inner surface of the pinions. As the sliding key is moved along the shaft, the pinion key, by means of a spring, is forced down in the keyway, a driving connection between the two pinions being in this way obtained. Any pair of pinions can be made to transmit the power according to the position of the sliding key, which is controlled by a change-speed lever in the usual way.

**The British Motor Company's Exhibit.**

THE BRITISH MOTOR AND ENGINEERING COMPANY, LTD., were present with a couple of cars, of respectively 64-h.p. and 10-12-h.p., which will appeal particularly to that class of people ranged under the phrase of the "man of moderate means." Fig. 53 illustrates the engine of the larger vehicle. The four-cylinder motor, with mechanically-operated valves, is mounted in the front end of a steel frame in the usual position; the ignition is by accumulators. The change-speed mechanism gives three speeds and reverse, the gears being always in mesh; the shafts are carried in a sort of skeleton frame, the covers being detachable to enable the pinions to be readily inspected without in any way disturbing the same. The transmission is by cardan shaft

Fig. 53.—View of four-cylinder Motor on British Motor and Engineering Co.'s 10-12-h.p. Car.

to a live back axle running on ball bearings. There are three brakes of the internal expanding type; one on the countershaft is actuated by pedal, and the two on the back axle by a hand lever. A notable feature of the vehicle is the mounting of the starting handle on the dashboard, so that the driver may put the engine in motion without leaving his seat. The steering wheel is hinged so that it may be tilted out of the way to allow easy entrance from the driving side. The vehicle is fitted with a roomy body seating four persons. The two-seated car is provided with a 64-h.p. double-cylinder engine, but in other respects follows the lines of the larger vehicle.

**The Fiat Cars.**

Prominent on the stand of FIAT MOTORS, LTD., was the chassis of the new Fiat 12-16-h.p. car, which is, generally speaking, a reproduction in miniature of the more powerful cars built by this well-known Italian concern. The pressed steel frame is narrowed in front to allow of a larger lock to the front wheels. The four-cylinder engine has its valves mechanically operated off separate cam shafts. The ignition is by low-tension magneto, and the carburettor is of the automatic air-regulating variety, provision being made to control the degree of opening of the petrol spraying jet from the dashboard. The clutch is of the metal-to-metal disc type, with springs interposed between the discs. Four speeds

ing of two nuts. All the valves as well as the magneto rods are adjustable, and can be set to a hair's breadth, so that the efficiency of the engine is maintained. The carburettor is of an improved type, provision being made for the regulation of the flow of petrol through the jet as well as the quantity of air supplied to the mixture. Only a very light pressure is required to declutch, and when released the clutch, which is of the metal-to-metal type, runs on ball bearings. The connection between the clutch and the gear-box is made by a long tubular shaft of large diameter and very solid construction with universal joints at each end. Four speeds and a reverse are fitted with gate control. With the exception of the engine, ball bearings are

Fig. 54.—Elevation of Chassis of Fiat 12-16 h.p. Car.

forward and a reverse are controlled by a lever working in a "gate," the final drive being by means of side chains. The car has a wheel base of 9 ft. 5 in., permitting of the fitting of any type of side-entrance body. We may add that ball bearings are employed throughout with the exception of the engine.

**The Crossley Cars.**

One of the finest and most interesting stands in the show was that of Messrs. JARROTT AND LETTS, LTD., who were showing examples of the latest types of Crossley cars. Interest was largely centred in

provided to all the shafts and axles. The usual brakes are fitted, namely, an external contracting brake of large diameter on the cross shaft and internal expanding hub brakes to the rear road wheels. This steering gear is of the irreversible type, of a large and particularly strong pattern, special arrangements being made for easy adjustment. The axles are of H section, the front axle swivels rotating on ball bearings, the weight being supported on a ball or cup, thus rendering the steering easy and perfectly safe from any binding action through lack of lubrication. The latter is entirely automatic, oil being fed to all parts from a tank fitted

Fig. 55.—Chassis of Crossley 40-h.p. Car.

the fine polished chassis of the new 40-h.p. vehicle (Fig. 55). The engine, which has already been illustrated in the *M.C.J.*, and which develops about 45-h.p., is built on the same simple constructional lines as have always distinguished the Crossley motors, all bearings being ring lubricated and special wells provided in the base chamber into which the cranks dip at every revolution. Low-tension magneto ignition of the Simms-Bosch type is adopted, whilst the valves are mechanically operated, the inlet valves being on the opposite side to the exhausts, the valve chambers themselves having covers easily detached by the loosen-

to the frame, the oil passing through sight feeds on the dash board. The complete chassis is low, and it is fitted with 36 in. road wheels. The wheelbase is 10 ft. 3 in., and the length of frame available for fitting of carriage body from dashboard to rear 8 ft. 1 in. Another interesting exhibit seen for the first time was the 20-25-h.p. Crossley live axle car, which has been specially designed and constructed for town work and for the fitting of landaulet and limousine carriage bodies. The engine and clutch are on similar lines to those on the 22-28-h.p. The gear-box gives three forward speeds and a reverse with direct drive on top. The back

axle is of strong construction, the weight of the carriage and frame being carried on the outer sleeve, thus relieving the axle itself from all strain. Ball bearings are fitted on each side of the hubs of the road wheels, the rear pair being suspended between two rows of large ball bearings. The complete cars on view included a 40-h.p. demi-limousine, specially arranged for touring, and finished in dark red picked out with a black line edged with fine gold lines, and a 22-28-h.p. phaeton finished in dark blue picked out with white.

#### The Decauville Cars.

Messrs. H. M. HOBSON, LTD., confined their exhibit of the well-known Decauville cars to examples of the 12-16-h.p. and 16-20-h.p. models, both being fitted with four-cylinder engines. All the cars have the standard Decauville live axle, in which the rear road wheels are not fitted on the axle, but on a sleeve surrounding the same, the power being transmitted to them through "dogs" on the ends of the axle. Other features of the vehicles are the special form of carburettor, in which all the air has to pass round the spraying nozzle, and this, with the variable opening for the admission of air, gives an automatically-controlled perfect mixture at all engine speeds. Two ignitions are now provided, Simms-Bosch high tension ignition being now fitted in addition to that by coil and accumulators. The mechanical details of these well-known cars, which have been referred to in our reports of the Paris and Olympia shows, are too well known to need repetition. In connection, however, with this exhibit we would draw particular attention to the very smart French and English bodies mounted upon the three chassis. The complete cars on view included a 12-16-h.p. landaulet and a

Fig. 56.—Rear View of Chassis of Crossley 22-28-h.p. Car.

16-20-h.p. side-entrance double phaeton, the body work of which was of a high order.

#### The Brouhot Cars.

Several examples of Brouhot cars were to be seen at the stand of the BROUHOT MOTOR COMPANY OF GREAT BRITAIN, LTD. The vehicles on view included a 24-30-h.p. chassis, a 20-24-h.p. demi-limousine, and a 40-50-h.p. touring car with racing body. They are on modern lines throughout, the frames being of pressed steel, the engines of the four-cylinder type, and the transmission by side chains. The valves are all interchangeable and mechanically actuated off a single cam shaft. The inlets are provided with a variable lift device, obtained by means of tapered wedge pieces which can be inserted between the valve push rods and stems, the arrangement being controlled by a lever on the steering wheel. Ignition is by low-tension magneto, with provision to retard the firing point; a gear-driven pump feeds the oil to the various points of the engine. The clutch, which is so constructed that it can be readily taken down when necessary, has an internal expanding movement obtained through arms linked up by springs. The gear-box is adapted to give four speeds forward and a reverse controlled by a single lever working in a "gate" quadrant. Other features of the Brouhot cars include the fitting of double brakes on the countershaft (Fig. 57) and the handy form of adjusting the tension of the driving chains, which have already been illustrated in these columns. Ball bearings are used throughout, with the exception of the engine, and it may be added that all the petrol, water, and lubricating

pipes have welded joints, and further, that all the spring hangers are detachable from the main frame, so that they may readily be replaced should they by any means become damaged.

#### The National Car.

Messrs. LAMB BROTHERS AND GARNETT were unfortunately unable to complete the National 50-70-h.p. six-cylinder car for the Show, so had to be content with a display of several well-finished examples of the well-

Fig. 57.—View of rear portion of Chassis of Brouhot Car. The illustration shows the differential shaft brakes and the special chain adjustment.

known 18-22-h.p. vehicle. The engine of the latter comprises three separate cylinders,  $4\frac{1}{2}$  in. bore by  $5\frac{1}{2}$  in. stroke, set in the fore part of a pressed steel frame. The distribution gear for the valves and the contact-breaker is comprised in the crank-chamber, but the wipe contact-breaker itself is driven by means of a pair of bevel pinions at the rear end. The inlet and exhaust valves are mechanically operated off a single cam-shaft. The inlet-valves have a variable lift, obtained by a horizontal rack, which engages with three similar-toothed segments, one for each cylinder, and by rotating which both the amount as well as the duration of the lift can be regulated. This is controlled by a lever on the steering wheel, a new departure being the fitting of a pedal

Fig. 58.—The Duplex Hub Brakes on the National Car.

by means of which a full lift can be temporarily given to the valves, and the speed of the engine consequently accelerated. The automatic carburettor is provided with a jet which can be adjusted from the steering

wheel, the degree of variation being marked on a notched plate. The supplementary air-valve is fitted with an easy means of adjustment. The base chamber is provided with hand holes to enable the big ends to be readily inspected. Cocks are also fitted in the bottom of the crank chamber, these being controlled from above by a miniature change-speed lever, working in a quadrant. The lever can take three positions: (1) shut, (2) open to allow the oil to be drained off, and (3) to allow any excess of oil above a certain level to pass away. The water circulation is maintained by pump and honeycomb radiator with fan. The clutch is of the leather-faced cone type. Three springs are interposed and provision is made for their adjustment by single nuts, which are made self-holding by means of a hollow and fixed washer. The change-speed gear is adapted to give three speeds forward and a reverse. The gear wheels are of large diameter, and on top speed the drive is direct to the rear axle. From the gear-box the power is transmitted by a cardan shaft, the universal joints of which are provided with renewable bushes, to a bevel pinion meshing with a large wheel on the back axle, which has only to transmit the drive, the weight of the car being taken by the sleeve. A pedal operates a pair of external band brakes on the rear wheels, while a side lever also actuates a couple of internal expanding brakes on the same wheels; the arrangement of the brakes is illustrated in Fig. 58. The control of the car is extremely simple, and we noted that every working part—springs, bolts, brakework—is provided with its lubricator, so that everything can be kept smooth working and free. Altogether the National cars, which are throughout of British manufacture, are on thoroughly sound lines, and, as will be seen from the foregoing particulars, comprise a number of interesting details.

Fig. 59.—The National 18-22 h.p. Landaulet, built for Mr. C. L. Casalet, the well-known tennis player.

#### The Darracq Cars.

A. DARRACQ AND CO., LTD., had a large stand, on which were shown a full range of the 1906 Darracq cars—8-h.p., 10-h.p., 15-h.p., 20-h.p., and 40-h.p., the latter being exhibited for the first time. The features of the 1906 models have already been fully dealt with in these columns, so that it need only be briefly mentioned that one of the most important changes is the employment of a progressive clutch. The leather-faced clutch is retained, but four studs pierce its circumference near the outer edge, raising the leather very slightly. Within the cone are bolted four metal sleeves that contain the terminals of the studs and a spring of special construction. The pressure of the springs acting through the broad-faced studs on the surface of the female cone prevents the clutch being let in with too much force; even if the foot is suddenly released from the pedal these springs will, it is claimed, take up so much of the impetus as to prevent breakage. Press-down pedals have been abandoned for those of the push-forward type, which have been given a long leverage and been so placed that the foot is in a natural position when pressing home. The pedals are but two in number, the left one acting on the clutch and at the same time diminishing the supply of gas so as to prevent the motor racing when suddenly relieved of the load. The right-hand pedal withdraws the clutch and controls an internal expanding metal-to-metal brake acting on a drum just behind the change-speed gear. There is only one hand lever at the side, which controls internal expanding brakes on the rear wheel hubs. Everything connected with the control of the car is placed on or round the steering wheel, the change-speed lever being, as usual in Darracq cars, on the steering column. The 8-h.p. car, which has a double phaeton body with entrance through a swinging front seat, is fitted with a single-cylinder engine, 112 mm. bore by 130 mm. stroke. It is equipped with a governor which controls the speed of the engine by varying the lift of the inlet valves. Fig. 60 depicts one of the new 10-h.p. double-cylinder side-entrance cars, which are attracting much attention. The cylinder dimensions in this model are 100 mm. bore by 120 mm. stroke; the valves are all mechanically actuated off a single cam shaft, which is extended so as also to drive the pump and the high tension magneto where the latter is desired. In the standard car, however, the ignition

is by coils and accumulators. The well-known 15-h.p. Darracq was also prominent on the stand, and with the detail improvements which have been introduced should continue a popular type. Among the changes we note that the frame is raised at the rear end, a departure which is incorporated in the new 20-h.p. car. The latter has a four-cylinder engine on the lines of the twin-cylinder 10-h.p.; the bore and stroke is, however, slightly larger, being 112 mm. by 120 mm. Both

Fig. 60.—The new Darracq 10-h.p. Car.

high and low tension ignition are provided on this car; the engine is capable of developing up to 32-h.p. The throttle lever on the steering wheel is arranged so that it does not turn with the latter; the clutch is also connected up with the throttle. The gear-box gives three speeds and a reverse; the shafts of the same are provided with ball bearings of the D.W.F. type. Any style of body can be fitted to the chassis, those exhibited comprising tonneaux, landaulets, limousines, and side-entrance double phaetons.

#### Darracq and Panhard Cars.

Messrs. HALL AND CO., of Tonbridge, who have been agents for Darracq cars for several years, staged a couple of these well-known cars including a 20-32-h.p. four-cylinder limousine and a side-entrance double phaeton of similar power. A 10-h.p. Panhard car was also on view.

#### The Hotchkiss Cars.

The stand of the LONDON AND PARISIAN MOTOR COMPANY was the centre of considerable attraction, the display of Hotchkiss cars shown thereon being by far the largest so far made in this country. Pride of place was given to a fine show chassis of the latest type of Hotchkiss 30-35-h.p. car. While several features are retained, many modifications have been introduced. The engine, which has four cylinders, 112 mm. bore by 120 mm. stroke, is still fitted with a ball-bearing crank shaft, but in place of only three five bearings are now provided. Ignition is now by means of a gear-driven Eisemann high-tension magneto. The carburettor has been improved in so far that provision is made for varying the feed of petrol through the jet in accordance with the position of the hand and foot-controlled throttle valve. The gear-box gives four speeds forward and a reverse, controlled by a lever working in a "gate," and giving a direct drive on the top speed. The cardan shaft and bevel gear system of transmission is retained, a noticeable feature of the live axle being that no tension rods are employed. The axle, however, is of the enclosed type, and does not bear the weight of the car, which is taken by the sleeve, the axle thus having only the driving effort to sustain. The differential casing is divided horizontally instead of vertically, so that the bevels or the differential can be examined at any time by simply undoing a few bolts, and without in any way disturbing the axle. The complete cars on view comprised a handsome 30-35-h.p. with limousine body by Hooper, built for the Duke of Westminster; a

Fig. 61.—Plan of Chassis of Hotchkiss 30-35-h.p. Car.

30-35-h.p. phaeton, a 30-35-h.p. car fitted with a special body by Thorn known as the Corbet phaeton; and a 25-29-h.p. landaulet. Although not on the stand, great interest was shown in the first Hotchkiss six-cylinder car which was being used for trial runs. The vehicle is on the usual Hotchkiss lines, the engine being rated at 40-45-h.p. Reference was made in our last issue to the journey of this car by road from Paris to London, and we may mention that its quiet running and great flexibility has decided the builders to largely devote their energies to "sixes" in the future.

### The Gobron-Brillie Cars.

THE GOBRON-BRILLIE BRITISH MOTOR COMPANY, LTD., had on view two handsome 35-h.p. Gobron-Brillie cars, one fitted with a convertible limousine and the other with a landaulet body, and a chassis of the latest touring car. The special type of engine employed on these cars remains the great feature of the vehicles; it is already fairly well known to old readers of the *M.C.J.*, in the pages of which it has been fully described and illustrated. It may, however, be mentioned that while the motor comprises four vertical cylinders, there are two pistons in each, the explosion chamber being located

Fig. 62.—Elevation of Chassis of Gobron-Brillie 35-h.p. Car.

between each pair. The valves are all mechanically operated and interchangeable, the inlets being on the opposite side to the exhaust. Both accumulator and high-tension magneto ignition are employed. The water circulation is maintained by a gear-driven pump and a honeycomb radiator with fan. The clutch is of special design, being practically in duplicate, there being two cones. The smaller one, which is metal-to-metal, engages first, followed by the engagement of the large one, the cone of which is leather-faced. Both clutches are controlled by the same pedal; the advantage of the arrangement is that the engine is put into gear without shock, while, to further reduce any strain on the gear-box, a universal joint is introduced between the latter and the clutch. Four speeds and a reverse are controlled by a lever working in a "gate" quadrant. A 24-h.p. landaulet was also on view, being shown for the first time. It follows the general lines of the larger vehicles, but we note that all the valves are located on the same side of the engine.

not terminate at the bevel pinion, but is extended and passes over the axle. Motion is transmitted from one shaft to the other by skew-bevel gearing, consisting of pinions on the shaft meshing with wheels on the axle. As the two pairs of pinions and wheels are in different planes, the teeth of the latter are cut on the skew, to gear properly. The pinions for forward drive are always in mesh with their respective wheels, but are only fixed to the shaft one at a time by means of sliding clutches

Fig. 63.—The Ridley Two-Seated Car.

which are coupled so that the engagement of one wheel is preceded by the disengagement of the other. The reversing pinion engages the low speed wheel and slides out of gear when not in use. The necessary parts are completely encased, in an oil-retaining gear case. Although the standard car is fitted with a two-seated body, it can be provided with other forms, the Ridley Company also showing one fitted up as a light van.

### The Vinot-Deguingand Cars.

An excellent display of the Vinot-Deguingand cars was made by the British agents, Messrs. T. J. HARMAN AND CO., the vehicles on view including a 14-20-h.p. polished chassis and a handsome double

Fig. 64.—The Vinot-Deguingand 12-16-h.p. Side Entrance Double Phaeton.

### The Ridley Cars.

THE RIDLEY MOTOR COMPANY, Paisley, was among the exhibitors of cars which appealed to motorists of moderate means, the Ridley two-seater, illustrated in Fig. 63, attracting much attention. The motive power is supplied by a 6-h.p. single-cylinder engine set in the fore part of a tubular frame. The principal feature of the vehicle is found in the transmission arrangement, the whole of the drive being direct from the clutch to the rear live axle. Two speeds and a reverse are provided by a change-speed gear combined with the bevel gear drive. There is no differential gear in the ordinary sense of the word, the road wheels being fitted to the single piece axle by free-wheel clutches, so that the outer wheels can overrun when turning corners. The longitudinal shaft does

phaeton with Cape cart hood and similar power, and a 20-30-h.p. limousine. Both are fitted with four-cylinder engines with the inlet and exhaust valves actuated by separate cam shafts. The dimensions of the four-cylinders of the 14-20-h.p. engine are 90 mm. bore by 130 mm., and of the 20-30-h.p. 103 mm. by 130 mm. The lubrication of the engine is effected by a small pump operated by an eccentric off one of the cam shafts. The clutch is of the leather-faced cone type; it has already been illustrated in the *M.C.J.*, but we may mention that it is free to take any position within a certain angle round a spherical bearing, the drive being transmitted from the male member to studs formed on a boss mounted rigidly on the shaft which connects the clutch to the gear-box. The latter provides either three or four forward speeds and a

reverse, with direct drive on top speed, the control lever working in a special form of vertical gate quadrant. The final drive is by side chains. The brakes are of the internal expanding variety, and we note the rear dumb irons have been replaced by halves of semi-elliptical springs. The Vinot cars are a very popular type in France, and the excellent showing one made in the tourist trophy race last year has made them many friends in this country. Messrs. Harman also exhibited the Caron system of low-tension ignition, of which a description was published in these columns some time ago.

#### The "Eyre" Anti-Skid.

Differing in many respects from the familiar form of anti-skid, that shown by Messrs. EYRE attracted considerable attention. Its chief feature is a series of bands or loops which do not encircle the tyre but are secured to the spokes of the wheel by clips travelling in a parallel line with the course of the wheel. Should a side-slip be imminent the lateral motion of the wheel enables it to mount one or more of the loops, as each, when at its lowest level, presses the ground close to the side of the tyre. Thus the side-slip is avoided. The loops are formed of twisted steel cable, and are always ready for use without injuring the tyres. Economical and secure, the Eyre "anti-skid" has obtained many ardent advocates.

#### A New Wheel.

A fortnight ago we made mention of the varied display of wheel-work from the works of Messrs. SMITH, PARFREY AND CO. Included on their stand after the first day of the show was the Wilmot patent wheel for automobiles. In this a section of the flange can be taken off by the removal of four bolts to facilitate the attachment or detachment of the tyre, a good idea well worked out.

#### The Krieger Electrical Carriage.

A couple of highly-finished electric cars—a victoria and a landaulet, were to be seen at the stand of the KRIEGER ELECTRIC CARRIAGE SYNDICATE, LIMITED. The Krieger system has already been described in the *M.C.J.*, but it may be mentioned that two  $4\frac{1}{2}$ -h.p. compound electric motors drive the front road wheels through spur gearing. The electrical energy is furnished by a battery of forty-four Fulmen or

Fig. 65.—The Krieger Electrical Landaulet.

Société de Metal accumulators, one charge of which is stated to be capable of running the vehicle a distance of forty miles. The control, which is so arranged as to be easily manipulated, is adapted to give six forward speeds, two battery recuperating positions, one electric brake and a reverse motion.

#### Silencers, Etc.

Mr. G. ALDINGTON showed silencers for petrol motors of all sizes, cooling fans and the Kent variable gear, the latter being a gear for motor-cycles, tri-cars, etc., with a large diameter free engine clutch. This was first exhibited at the Stanley Show, when it was described in the *M.C.J.* Among the silencers on the stand we specially noticed the "Silent" silencer, which is constructed entirely of steel with the exception of the balls that are packed between the two chambers; these are made of aluminium. It is easily fitted to any machine, the nozzle being bored to desired size. By unscrewing the centre nut the nozzle can be taken out of the silencer for fitting on exhaust pipe. This will effectively silence the motor-car and is being used by many motorists.

#### Clarbun Bronze.

Those in search of a suitable metal for bearings were attracted to Messrs. CLARK, BUNNETT and Co.'s stand, whereon were exhibited several examples of Clarbun bronze, which has attained considerable favour. This is a comparatively new bronze, in which anti-frictional properties of a high order are combined with a uniform resistance to the load over its whole surface. The danger arising from the scoring of shaft journals is obviated by the use of this metal. Bearings formed of Clarbun bronze present to the load the same smooth surface throughout their life, while the low coefficient of friction of the bronze adds considerably to the efficiency of the motor by absorbing only the minimum of power, besides using only the minimum amount of lubricant and ensuring coolness of running.

#### The Sawyer Band.

Maintaining its popularity, the Sawyer Band was shown by Messrs. Sawyer and Co., who also had on view various specimens of tyres which had been repaired. Care is taken by the firm to examine old tyres

sent to be fitted with the Sawyer bands, so that only those likely to secure satisfaction in use are dealt with. The bands themselves are detachable and vulcanised on—those for motor-cycles being only vulcanised as near the bead as the rims will allow.

#### Motor Bodies.

MESSRS. MAYTHORN AND SON'S coach work was to be seen elsewhere than at their own particular stand. The landaulet-limousine illustrated in Fig. 66 was a striking vehicle shown by them, its extended

Fig. 66.—The Maythorn Landaulet-Limousine Body.

front and doors artistically picked out with black lines on a green background giving it a distinguished appearance. Another good exhibit was a stylish touring phaeton—all the different exhibits being evidence of good finish and construction.

Messrs. McNAUGHT AND CO. have attained distinction in connection with the automobile movement, their motor bodies being of good design and excellent workmanship. They showed a limousine body of high finish, the double motor landaulet on view being also characterised by a pleasing outline. At their Worcester headquarters the firm have an extensive garage, and are well equipped for repair as well as new work of a high order.

#### Motor Bicycles.

MESSRS. HAMMOND AND SMITH, LTD., showed the Clarendon 3-h.p. motor-bicycle, which has a long wheel base. The bottom head lug of the frame is all in one casting, thus reducing the likelihood of fracture at this vital part of the machine to a practical impossibility. The dimensions of the cylinder are 3 in. by  $3\frac{1}{4}$  in. The engine is fitted with a mechanical inlet valve and attached to the frame in a vertical position by four bolts, being supported by a loop tube. Taps are fitted to the head of the cylinder for the injection of oil for cleaning purposes, and to the bottom of the crank chamber for drawing off waste oil. Transmission is by belt, Longuemare or Brown and Barlow's carburettor being fitted. The capacity of the tank is 120 miles, and the general appearance of the machine is pleasing and attractive.

#### Coachwork.

Mr. WM. VINCENT had a large collection of high-class motor bodies, one of which is illustrated in Fig. 67. His works are well equipped for the production of good class work, and many of the leading gentry on the banks of the Thames have recognised his excellent facilities by

Fig. 67.—A Vincent Motor Car Body with Improved Limousine Top.

ordering carriage bodies from his works at Reading. One of the most attractive exhibits was an improved limousine top, provided with ordinary roll-over upholstery for ensuring a better appearance to the car when being used without the top. Mr. Vincent's practical experience of the requirements of motorists is evidently being utilised to their advantage.

**The Tyler Engines.**

Messrs. J. TYLOR AND SONS, LTD., of Belle Isle, N., who have put down a modern plant of machine tools specially suited to the manufacture of petrol engines, had on view several examples of the same which were noticeable for their excellent design and finish. Four sizes are being made, 10-h.p. and 20-h.p. two-cylinder, and 18-20-h.p., 24-28-h.p., and 35-40-h.p. four-cylinder. We give an illustration of the latter, which has been specially designed for motor-bus and other heavy work, in Fig. 68. The various types, except as regards the cylinders and the dimensions of the same, are on similar lines, so that the following description of the 35-40-h.p. may be taken as applying to all. The cylinders, which are cast separately, are 5 in. bore by 5½ in. diameter; the valves are placed on opposite sides, being actuated off separate cam shafts, and may be withdrawn together with their seatings by removing a bridge piece. The valve tappets are fitted with adjustable screw caps, while the

Fig. 68.—The Tyler 35-40-h.p. Four-Cylinder Engine.

cam shafts can be withdrawn from the crank case without dismantling the engine. The crank case is provided with a large inspection door on each side. The bottom half is also so arranged that it can be detached without interfering with the shaft bearings, which are carried by the upper part; the crank shaft has a bearing between each crank. The smaller engines are fitted with the ordinary contact maker, or with Messrs. Tyler's special form of high-tension distributor. On the larger engines provision is made for a high or low tension magneto, in addition to which battery ignition can be fitted if desired. The lubrication is on the splash system, oil ducts being provided to the various bearings. Partitions are also formed in the base chamber to ensure a proper supply of oil to each cylinder. We may add that all the castings, in iron, aluminium, and gunmetal, are made in Messrs. Tyler's own foundry, and that all parts are made on the interchangeable system.

**Marine Reversing Gears.**

Among the exhibits of special interest to motor-boatists was the "Ideal" reversing gear made by Messrs. DICKINSON AND BURNE, LTD., of Guildford. This has the initial advantage of being entirely self-contained, the clutch, reverse and thrust block being all in one frame. The method of engaging the ahead or astern gear is by one double-friction cone, self-contained, self-holding, and self-adjusting. When driving ahead the friction cone acts as an outer member of a clutch, engaging with an inner portion which is keyed on to the driven bronze shaft, thereby making the gear-box revolve with the shaft as a solid body. When driven astern, the gear-box has of course to be held, and this is done by the friction cone acting as the inner member of a clutch, and engaging with an outer member, which is rigidly fastened to the frame. The engagement is gradual and free from shock and the device allows craft propelled by internal combustion engines to be manoeuvred with the same facility as steam vessels.

**Accessories and Fittings.**

Messrs. ROSS, COURTNEY AND CO., LTD., had a good display of their accessories, fittings, etc., all of good class workmanship. Among the special exhibits was a new petrol pourer ensuring the free and rapid filling of a tank without the petrol bubbling or puffing around the tank filler or in the funnel, the latter accessory being, in fact, unnecessary when using the pourer. It is made to fit the two standard sizes of stopper on petrol cars, viz., 1 in. and 1½ in., and contains not only a strainer but also a filter through which the petrol passes on its way from can to tank. The firm have also a new sparking plug in which there are no exposed metal parts. Short circuiting to the hexagon gland-nut of the plug itself or to the near by parts of the engine or car is entirely eliminated. The internal construction is such that the full power of the current is conveyed to the points and an intense spark is assured. The points do not soot or get foul, and a misfire is quite unknown, even in an oil-flooded cylinder. Petrol gauges, greasers,

fitters for sight feed lubricators, control levers, pumps, connection swivels and bolts and nuts, with English and French threads, made up a very useful display highly creditable to British industry.

**Petrol Filler.**

Mr. W. PETTETT was able to show a long list of orders received for his combination funnel can and filler, known as the "Dripless." By the use of this filler it is impossible to overfill any tank, for as soon as the liquid comes up to the spout, from which it is being poured into another vessel, it stops running. In motor garages the device will be found a great boon, adding materially to the safety of the establishment. For use with petrol cans the safety filler is a capital little instrument adaptable to all tins. A piece of wire gauze within the filler prevents foreign matter reaching the tank, and the use of a funnel is entirely obviated. By its use the tank can be filled in the dark, thus minimising the risk of fire. The device is being placed on the market by Pettett's Patent Safety Filler Company.

**The Robeson Coat.**

Rugs have their use and also their disadvantages when on the car, and to obviate the necessity for their presence, so far as the driver is concerned, Mr. JOHN ROBESON has brought out a new coat which he introduced to motorists at the Show. The invention consists of divilin; the skirt of the coat for some distance up, and opposite to each leg. Flaps are inserted in each section, these flaps being of such a character that they are held by means of easy snap fastenings quite flat and securely against the skirt. When the coat is worn in a sitting position, the fastenings can be instantly undone; the flaps fall round inconspicuously, and fit in and envelop the knee. The effect of this is to cause the coat to hang down low in front, forming a "Mulum in parvo" apron, and the wearer, whilst possessing perfect freedom and ease of movement, is protected from exposure in every way.

**The Malcolm Car and Engines.**

THE YUKON MOTOR AND ENGINEERING WORKS, Balham, had on view a neat two-seated car, fitted with a 6-h.p. two-cylinder engine. The transmission is through a leather clutch and a gear-box, giving three speeds forward and a reverse with a direct drive on top speed, the final drive being by side chains. Our interest at this stand was, however, mainly centred on the display of the Malcolm four and six-cylinder engines of respectively 12-16-h.p. and 18-22-h.p. We give in Fig. 69 an illustration of the "six"; as the two sizes are made on similar lines, the following description may be taken as applying to both. As will be seen, the cylinders are cast separately, the bore being 80 mm. and the stroke 110 mm. The valves, which are interchangeable, are arranged symmetrically on either side, being operated off separate cam shafts. The crank shafts, which are of nickel steel, have the cranks set at 180 degrees in the case of the four-cylinder engine and at 120 degrees in the six, a bearing being provided between each throw. The base chamber is made in three parts, the lower one of which can be readily removed to allow the big ends and the crank shaft bearings to be inspected without disturbing the same. A special

Fig. 69.—The Malcolm 18-22-h.p. Six-Cylinder Engine.

feature of the motors is found in the method of fixing the gudgeon pin in the pistons, which prevents it working out and scoring the cylinders. The pin itself is carried in a ring which is screwed into the piston block up against a flange turned in the latter. The threaded ring is partially sawn through at a point about half an inch from its lower edge, two small set screws binding the separated portion on to the internally threaded piston, the arrangement forming a lock nut. The four and six cylinder engines develop respectively 12-h.p. and 18-h.p. at a normal speed of 1,000 revolutions per minute, but the rate can be varied from 50 to 2,500 revolutions as desired by means of a variable lift to the inlet valves, which is obtained by a movable cam shaft. Altogether the Malcolm engines appear to be on sound engineering lines and bear evidence of careful design and attention to details.

(To be continued.)

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, W.C.]

### OFFSET CRANKSHAFTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have several times carefully read the article entitled "Offset Crankshafts, an Adverse View," in your issue of the 31st ult., and each time with increasing wonder as to what the adverse view may consist of. Permit me, therefore, to briefly analyse what the writer has to say.

(1) "The matter is attracting some attention in various countries, and an American Professor states that one of the problems that has to be solved in motor design relates to the friction caused by oblique thrust on piston." Granted. (2) "The question is not entirely new. The advantages of this plan are apparent." Here he gives some reasons why—but by no means the most important. Still, once more, granted. (3) Investigation and adoption by a "few prominent firms" "not necessarily indicative of its overwhelming merit." No one who has studied the matter does claim overwhelming merit, but the firms who have adopted the system can prove certain advantages fully warranting the practice. (4) "There is much to be said both for and against it." Then why not give us a few cogent reasons for his adverse views? (5) "Spark Gaps" are instanced as prophetic of the fate in store for offset crankshafts! To anyone understanding the wide difference in the two subjects the want of logical comparison is obvious. (6) "Will the increased life of an engine built in this manner (offset crankshaft) compensate for the necessarily increased cost?" I have been designing and building engines on this system for some four years, and up to the present cannot discover that one farthing is added to the cost of production; but if ever there should be a slight additional expense, I contend that it is a very poor argument to condemn it on. (7) "Another side to the question" is "increasing homogeneity of the motor-car." A horrible suspicion here is forced upon me that the writer has not grasped what offsetting the crankshaft really means! Or else what does he wish to be understood by insinuating want of homogeneity? He concludes by mentioning the "absolute necessity" of "talking points" "for the sales department," and I would respectfully suggest that logical points are as necessary when engaged in the article writing department as loquacity.—Yours truly,

A. E. S. CRAIG.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read with great interest the article on the question of offsetting crankshafts, which appeared in the *M.C.J.* of the 24th ult. The principle is, of course, very old, having been used over thirty years ago in the Bischof gas engine, where it was carried to an extreme. The piston rod, passing clear to one side of the path of the crank and the connecting rod was practically parallel to the piston rod when the engine was at the middle of its working stroke. While the system has undoubted advantages, there are also disadvantages, the most important of these being that by the offsetting of the cranks in a four-cylinder engine the kinetic balance is disturbed proportionately to the amount of offsetting with a given length of connecting rod, owing to the fact that the motion of the piston differs further from true harmonic motion, which is the ideal condition for a perfect balance.

Another disadvantage is that the top and bottom dead centres are no longer 180 deg. apart from each other, and this complicates to a certain extent the question of valve and ignition setting. There is, of course, no doubt that minimising the obliquity of the connecting rod on the working stroke, and thereby minimising the side thrust on the cylinders, is an important advantage, and it is quite probable that in the final type of motor-car engine there may be a small amount of offsetting, but I do not think that this will exceed  $\frac{1}{3}$  of the stroke.—Yours truly,

T. BLACKWOOD MURRAY.

### THREE-CYLINDER ENGINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We would join with Mr. Lamb in protest of the wild assertion made recently about three-cylinder engines "rocking" owing to "impulses always turning from one end of the engine to the other." Not long since some anonymous critic wrote to a contemporary that three-cylinder engines had a "hop and go one" sort of action, and in reply to that letter we asked him to come to our works and permit us to disprove his assertion, on condition that he published the results of his visit. As a matter of fact, he took good care not to come near the place, but another gentleman came—an engineer from the Crewe works—who was desirous of investigating the matter for himself, and he went away entirely convinced of the merits of the three-cylinder engine. We need scarcely say we shall be pleased at any time to convince any of your readers who hold any of these fantastic notions that they are wrong, if they will have the courage of their opinions and pay us a visit at our

works, and if they will record the result of that visit in your columns, and we have no doubt Messrs. Lamb Bros. and Garnett will be very pleased to do the same for any gentleman who may be located nearer their works than ours.

Now, on this question of rock, if there is a rock at all, it is not with an engine such as ours, but with the ordinary motor engine as fitted today. The turning movement is all in the direction of swinging the engine round its crank bearings, and these stresses set across the car. That it is no fanciful theory anyone who watches a big 120-h.p. racing car start up can see for themselves directly the engine fires, and directly there is any acceleration of the motor the whole lot is seen squirming sideways, the springs on one side going down, those on the other going up. This action, of course, is more visible on a 120-h.p. than on a 12-h.p., but it is going on exactly the same and in exactly the same ratio. If people would look at facts as they are, instead of talking through their hats so much, we should have less absurd prejudice to fight against, not only about the three-cylinder engines, but about lots of other things which the public only half understand.—Yours truly,

THE DURYEA MOTOR CO.

### THE SIZE OF CHAIN WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read with very great interest the letter appearing under the name of Mr. W. L. Hardman in the *M.C.J.* of the 24th ult., in regard to the size of chain wheels, and in reference to Professor Sharpe's opinion that chain wheels as now used had an insufficient number of teeth on them. I am interested because Mr. Critchley and myself, when considering the design of the Crossley cars, came to the same conclusion, and therefore it will be found in this year's Crossley car the sprocket chain wheels are very large indeed, and, as no doubt many of your readers will have noticed at the exhibition at the Agricultural Hall, the size of the two chain wheels on the 40-h.p. Crossley cars is as near as possible the same. That the result is beneficial I have already proved by the extraordinarily silent running of the car.—Yours truly,

CHAS. JARROTT.

### CYLINDER CAPACITY AND HORSE-POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to your note in the last issue of the *M.C.J.*, re Cylinder Capacity and Horse-power, it may interest you to know that the Eastern county makers of portable engines even now stick to the old plan of describing their engines as of so much nominal h.p. The old rule was  $\frac{(\text{cyl. diam.})^2}{10} = \text{n.h.p.}$ , and one n.h.p. = approx. three effective (or brake) h.p. There is one exception, namely, the firm of Messrs. Richard Garrett and Sons, Ltd., of Leiston, who long ago discarded this very unsatisfactory classification, and I believe they list their engines as so many indicated h.p., so that one knows what one is buying. It is news to me to learn that these engines were ever rated to work up to six times their nominal h.p. I was connected with the trade for some years, and I think three times is, at any rate, now the accepted figure among makers who still employ this prehistoric method of classification.—Yours truly,

A. VON STRALENDORFF.

### NOT PLAYING THE GAME.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—When visiting the Show at the Agricultural Hall last week I was somewhat surprised to find several concerns doing what I consider anything but playing the game. I refer to those firms who, in order to more forcibly impress the advantages of their productions on visitors, made use of their competitors' goods by way of comparison. This is a procedure which I venture to think no old-established firm indulges in. I have no grumble to make at any one extolling his own product as much as he chooses, but comparisons are odious, and never so much so as when a rival's goods are unfairly made use of.—Yours truly,

BRIXTONIAN

### DOES LOW TENSION MAGNETO IGNITION GIVE GREATER POWER THAN HIGH TENSION?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Re the above subject, we have not had the opportunity of making the actual tests which Mr. Jarrott has, but the German Daimler Company have evidently found from their tests that the high tension magneto gives the greater power, or it is hardly likely they would have abandoned the low tension magneto on their racing cars in favour of the high tension, their new six-cylinder racing engine being fitted with the Eisemann magneto.—Yours truly,

G. T. RICHES AND CO.

### THE COURTESY OF THE ROAD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I desire to call attention to the necessity of owners of cars giving their drivers strict orders to observe the usual etiquette of the road as observed amongst coachmen. Many drivers have not had training as grooms or coachmen, and, in consequence, make themselves

through ignorance mainly, a nuisance to other road users. The special point which I wish to emphasise is the matter of making up to and passing other vehicles. Unless on the very widest roads, no car should pass any horse-drawn cart or carriage at more than the legal speed; before passing any vehicle of whatever kind going in the same direction the horn should be sounded several times; and, still more important, no motor-car should pass another going in the same direction at over eighteen miles per hour, in a street or narrow road where there is traffic. These may seem to be very obvious recommendations, but anyone living on or near the Brighton road sees them constantly broken.

I was proceeding recently from Crawley to Three Bridges station, and going at the maximum safe pace of about eighteen miles per hour, a large limousine type car endeavoured to rush past whilst I was passing horse drawn traffic in the narrow street of the village. Fearing an accident, I ordered my driver to put on speed, and, in fact, was chased to the station by the car in question. I told the driver there that I would have reported him to the police had he passed me, and I regret that an occupant of the car appeared to regret my interference. Should I be summoned for exceeding the limit, would it be a good defence to say I was being chased?

The foregoing is only a sample of the annoyance and danger to

stand for several months without being used. Would it be best to partially discharge these and then recharge them? I understand it is injurious to accumulators to let them stand without being charged and discharged. I should also like to know whether accumulators should be entirely discharged before emptying the acid in order to clean them. If so, how should they be discharged?—Yours truly,

F. J. CLARKE.

[An accumulator which is to stand idle can be treated in two ways, either of which can be selected to suit the convenience of the user. It should either be thoroughly discharged or kept thoroughly well charged, in which latter case it is, of course, always ready for use. In the first instance, proceed as follows:—Thoroughly discharge the accumulator by connecting it to a 4-volt lamp or a coil of iron wire until it has discharged down to 1½ volts per cell, or 3·5 volts for a 4-volt set. Immediately after discharge, empty the acid out, and rinse the cells with water until they are quite free from acid in the plates or in the cell. Then drain it out and thoroughly dry the terminals and top of the case. Carefully vasoline the terminals and rubber bands to keep the latter soft, and put away in a card box to prevent dust settling on the top. In the second instance, charge up the accumulator so that it can be said to be thoroughly well charged. If there is a connecting wire joining the two cells together at the terminals, take this away, as it leaves the two

The Motor Fire Engine and Escape Tractor used by the Fire Brigade at Nancy, France.

In addition to the Fire Engine, a motor vehicle for the rapid conveyance of firemen, hose, etc., is in use at Nancy. The chassis was supplied by Messrs. De Dietrich, the equipment being furnished by Messrs. Morin-Gugumy, a French firm of fire engine builders, in conjunction with M. Drouville, the De Dietrich agent in Nancy.

which careful and law abiding motorists are exposed on the Brighton road especially.—Yours truly,

H. B. COLLINS.

### OVERHEATING TROUBLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reference to J. Barton's troubles, in a recent issue, the cause is due to the following:—1. The defective circulation is due to either a steam or an air lock generating in pipes between tank and pump, or a blocked pipe or joint between same points. 2. Misfiring in exhaust "box" it is not usual to switch off going round corners, &c., the best method being to retard the speed of your car previous to turning corners. The reason of the explosions is when the ignition is switched off unfired charges of gas are swept into exhaust-box, and fired through it, being hot, and also when switching on the exhaust gases firing the unexploded charge in exhaust-box.—Yours truly,

J. W. MORRIS.

### THE CARE OF ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be obliged if you or any reader of the *M.C.J.* would give me some hints as to how an accumulator should be treated which is not in constant use. I have two accumulators, and they often have to

cells with their pressure divided. See that the top of the cell is very clean and vaseline the terminals and rubbers; take out the vent corks, as they cause spraying. After three months charge up again if the accumulator appears to have lost its voltage. After an accumulator has been once properly formed, it is not necessary to charge and discharge it when standing, provided it has received a good charge before standing. The easiest method of discharging is by connecting a lamp up to the terminals and leaving it until quite out.]

### MORE ENGINE TROUBLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The trouble mentioned by "Xenophon" in the last issue of the *M.C.J.* is by no means uncommon with some types of carburettor. I have experienced it with several makes of cars, and have always found it to be due to the following cause. When the engine is running throttled down considerably there is sufficient vacuum in the mixing chamber to make petrol flow from the jet, but the velocity of the air passing the latter is not sufficient to carry all of this petrol to the engine. The result is that a pool of petrol collects in some part of the carburettor, and when the throttle is suddenly opened this petrol floods the cylinders, causing so rich a mixture that it will not fire, and if the engine has been running slowly for very long, it will actually stop before the mixture becomes sufficiently weak to fire again.

A considerable improvement can often be effected by warming the

air which passes the jet, if this is not already done. This can be managed in most cases by drawing this air from a casing fitting over an exhaust pipe of the engine. The air should not be heated too much—only sufficient to warm the mixing chamber of the carburettor. If this by itself is not enough to cure the evil, it can be further decreased by boring some holes into the mixing chamber and so decreasing the draw on the jet. These holes should be fitted with a sliding collar or other means of regulating their size. It will then be found that by adjusting the size of these holes the engine can be made to speed up more readily when the throttle is opened, and as the carburettor has an automatic air valve, they will not appreciably affect the mixture at full power. It may not then be possible to run the engine as slowly as before, but this is a much less evil than that complained of by your correspondent.—Yours truly,

H. R. LIEBSTEIN.

### LOW TENSION IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having read a letter a short time ago from a correspondent who was evidently prejudiced against low tension ignition in motor-cars, and who described the difficulty of starting a car with this ignition, contemptuously referring to the undignified turning of the starting handle for some time and the useless labour of doing so, I find it quite different. I have had a Richard-Brasier car now for ten months, and have driven over 4,000 miles. It is my second car, and I keep no mechanic. I find that if I flood the carburettor properly, and keep same and all pipes and filter clean, I can always start the engine, with the throttle closed, on the first half-turn of the handle. I can only assume that those

### MOTOR QUERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you kindly inform me, through the medium of your valued journal, what should be the relative distance from the bottom of the stroke that the exhaust valve should begin to open? In my motor it begins to open when the piston has descended seven-eighths of its stroke and finishes closing exactly as the piston reaches the extreme end of its upward stroke. Should it close also at seven-eighths of the upward stroke?—Yours truly,

SILENCER.

["Silencer" may rest assured that his valve is set quite correct so long as it is not held open over the top of the stroke. In the case of an inlet valve it should commence to open immediately following the closing of the exhaust, and close at the bottom of the stroke.]

### STEAM V. HORSE TRACTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have pleasure in giving you particulars of our Foden steam wagon for the past year. It has run over 6,000 miles, and, over some of the roughest roads in the country, carried nearly 5,000 tons of bricks, at a total cost in wages of £145; coal 36 tons; repairs. £23 15s. As regards the question as to the number of horses it has saved us, we could not attempt to do the work with horses that the steam wagon has done, the cost would be far and away too great, as it would take eight good horses to do it; in fact, the greater part of what our wagon has done is beyond horse work altogether. You will, no doubt, understand that

The opening Meet of the Motor Cycling Club at Brighton on Sunday last.

[E. W. Ashworth.]

who complain of low tension ignition—which, in my opinion, is the only one worth having on any car—either do not know how to manage it, or they have a bad magneto fitted to their car.

My last car was a De Dietrich fitted with Simms-Bosch low tension magneto, and I have not for a moment known what ignition troubles are in either car.—Yours truly,

TALLY-HO.

### AUTOMATIC CARBURETTORS AND WORN VALVE STEMS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The following may be of interest regarding your article on automatic carburettors in the last issue of the *M.C.J.* I have run a two-cylinder car for two years. The first year the petrol consumption was 17.5 miles per gallon. I then fitted an automatic air valve and enlarged the air inlet on induction tube, which was almost choked by gauze wire. The result the following year has shown petrol consumption 25.7 miles per gallon. My engine is an Aster, and I find the valve stems have worn down a quarter of an inch, and I conclude the tappets which operate them are similarly worn. Can you suggest any remedy for this, so that the tubes may get their original lift?

C. M.

[A good method to lengthen the valve stems when worn is to drill a piece of metal up a short distance to fit the end of the stem and allow a solid piece at the bottom to rest on the tappets; this need not be made fast, or it will not be possible to get valve stem through the guide; the spring of the valve will be quite sufficient to hold it in place.]

brick hauling is one of the roughest and heaviest jobs an engine can be put to, as new buildings are usually hard to get at, bad roads often leading to them.—Yours truly,

OAKLAND BROS.

ADDRESS WANTED.—We have an inquiry for the address of Messrs. Apin, Thackeray and Co., Ltd.

MR. H. C. NELSON wishes it to be known that he has never had any financial interest in the Motor Car Company (1905), Ltd.

VANS ON HIRE.—We have sent the names of several firms who have replied to the recent query to the firm making the request.

DIXI CARS.—"Ex-cyclist" writes:—"I shall be glad if you or any of your readers could give me their experience of 12-15-h.p. four-cylinder Dixi car, 1905 pattern; whether it is up to its nominal horse-power and is a reliable and economical car to run."

LETCHWORTH.—Inquirers are informed that the Garden City estate is thirty-four miles from London and that a considerable population is being attracted to the estate, where several factories, including a motor engineering works, have already started operations.

RENOLD CHAINS.—Messrs. Hans Renold, Ltd., write:—"A report has somehow got abroad that our projected new works are for the purpose of building motor-cars. This is an entire mistake and is calculated to embarrass us with valued friends in the motor-car trade. The new works are intended solely to enable us to cope with the largely increased and ever growing demand for our chains, and we shall, as hitherto, manufacture chains only for cycles and motors and for other driving purposes."

## CLUBS AND ASSOCIATIONS.

### THE MOTOR UNION.

At the Agricultural Hall, on Wednesday of last week, was held the annual meeting of the Motor Union, which now numbers over 11,000 members.

The Hon. Arthur Stanley, M.P., presided, and in reviewing the work of the past year referred with satisfaction to the influence which the union had brought to bear on various local bodies in respect of applications for restrictive speed limits in borough areas. On the question of inconsiderate driving Mr. Stanley said that one of the things from which motorists had suffered most was the fact that absolutely untrained and unskilful drivers were occasionally to be found on the road. It was very difficult to know how to remedy that state of things in a short space of time, but the Motor Union had gone into the matter, and a valuable report had been drawn up, which was on the point of being submitted to the committee. Referring to the question of the granting of driving certificates upon examination, Mr. Stanley contended that it was much better that this should be undertaken by the Automobile Club and Motor Union than by the Government. Once a certificate of proficiency were granted by the Government it would be difficult for them to take it away, whereas the club and union could say to a man whose conduct had proved objectionable, "You may be a skilful driver, but you are not the sort of man who is a credit to automobilism, and we shall not have you any longer on our register." That was the only way in which they could put down the curse of inconsiderate driving.

As regards dust, which was the chief cause of the unpopularity of the motor-car, the union was co-operating with the Roads Improvement Association, and was carrying out experiments in several places in order to see whether some form of dustless material could be obtained for road construction which, if it did not entirely remove, would at least minimise, the dust nuisance. Dealing with the question of the chances of fresh legislation this year concerning motor-cars, Mr. Stanley said that, speaking without political bias, he believed that the Government thought that they had got quite enough on their hands this year without going into the question of the Motor Car Act. Various opinions would be entertained as to whether it would be a good thing or not that there should be no legislation. He was inclined to think that it was a good thing. If there were to be any legislation this year, it was unlikely that the principal object which automobilists had in view—namely, the removal of the arbitrary speed limit, would be attained. Any addition, moreover, now made to the Motor Car Act would probably be of a permanent kind, instead of for a short term of years only. Every year, however, the motor-car became more widely used, and motorists, he hoped, would become more and more popular, so that the longer legislation was delayed the more likely they were to get a better Bill in the end.

The annual report, extracts for which have previously appeared in our columns, was adopted, and officers were elected for the ensuing twelve months.

The following motorists have been elected vice-presidents of the Motor Union:—Sir George Newnes, Bart., M.P., Mr. Rufus D. Isaacs, K.C., M.P., Mr. J. Muir Astbury, K.C., M.P., Col. H. C. L. Holden, Capt. J. A. Cole, J.P., Mr. W. Birtwistle, J.P., Dr. Hopkins Walters and Mr. T. W. Grace.

Sir George Livesey, Sir Francis Burdett, Bart., Mr. Alec Ogilvie, Mr. R. H. Hunter Weston (New Zealand), and Mr. T. L. Boyd have been elected life members.

### AUTOMOBILE MUTUAL PROTECTION ASSOCIATION.

The annual general meeting was held at Cordingley's Exhibition at the Agricultural Hall on Friday of last week, the president, the Earl of Shrewsbury and Talbot, in the chair. There were a large number of members present. The report for the year ending December 31st, 1905, was submitted and approved. There are now 104 members of the Association. The available funds show an increase of £132 over that of the previous year.

The Association has taken an active part on behalf of the trade during the past year and tendered evidence to the Royal Commission on Motor Cars, and has supported its members in resisting four specific attempts to foist master patents for essential details in car construction upon the trade.

The cordial relations between the Association, La Chambre Syndicale de l'Automobile de France and L'Association General de l'Automobile de France have been improved and strengthened, with the result that those associations agreed to support the English association in their various efforts for the benefit of the trade.

A great experiment is in hand with regard to the dust nuisance, to prove by practical demonstration that dustless roads can be made at a cost to the ratepayers of considerably less than the present system of dusty roads. In conjunction with the Kent County Council, a length of

the London-Maidstone roads is to be laid with contiguous sections of various dustless materials, so that the surface and relative wear can be carefully compared under identically the same traffic and similar conditions. These sections will be an object lesson to highway authorities throughout the country, and every information on the subject of cost will be placed at their disposal by the officers of the association. The association has become affiliated to the Roads Improvement Association.

At the council meeting held immediately after the general meeting, the representatives of Messrs. Moss and Woodd and James Robertson and Son were elected to the council. Mr. E. Shrapnell Smith tendered his resignation as secretary and was appointed a member of council of the association, and the assistant secretary, Mr. Douglas Mackenzie, A.M.I.Mech.E., was appointed secretary as from March 31st, 1906.

The association decided to tender evidence on behalf of the trade to the Royal Commission on Canals and the Royal Commission on Cabs and Omnibuses. The correspondence with regard to various patent actions was considered in detail. The meeting concluded with a cordial vote of thanks to the president, the Earl of Shrewsbury and Talbot, for his kindness in presiding at the annual general meeting and at the council meetings during the past season.

### AERO.

The Aero Club balloon was aloft again on Saturday with Captain Corbet, Messrs. Frank Butler and Moore-Brabazon, and the Hon. C. S. Rolls. The ascent was made from the Wandsworth Gas Works at a quarter past three, and a number of motor-cars started with the object of keeping in touch with the balloon, but although the aeronauts purposely kept at a low altitude—1,000 feet to 1,500 feet—the motorists had some difficulty in threading their way out of London, and the

The Inspection of the Motor Volunteers at the Recent Italian Military Manœuvres.

balloon was lost in the haze, though travelling at a very low rate of speed. A light northerly wind took the aeronauts over Sutton, Reigate, and Crawley. Seeing a pack of dragmonds hunting along their route the aeronauts descended to within a few hundred feet of the earth and with shouts of "Tally ho!" seemed for a few moments to be joining in the pursuit near the Brighton road. The final descent was made between Shoreham and Henfield, a few miles from the sea. Before deflating the balloon, the wind having fallen almost to a dead calm, Mr. Rolls landed his passengers and took up a number of persons for short ascents to view the neighbourhood, a rope a hundred yards long being used to convert the balloon into a captive one for the purpose.

### MOTOR VAN, WAGON AND OMNIBUS USERS' ASSOCIATION.

The title of the Motor Van and Wagon Users' Association will, as already announced in our columns, in future be the Motor Van, Wagon and Omnibus Users' Association. This alteration has been found necessary in view of the fact that all the principal companies operating motor-buses have joined the association. The chairman of the association is Colonel R. E. Crompton, C.B., M.I.C.E., and the following committee have been elected for the ensuing year:—Messrs. L. H. Baxendale (Pickfords, Ltd.), W. Worby Beaumont, M.Inst.C.E. (Hon. Engineer to Automobile Club), A. J. Clay (Bass, Ratcliffe and Gretton, Ltd.), F. C. A. Coventry, (Great Western Railway), Dalziel (the West of Scotland Carrying Company, Ltd.), J. L. Farmiloe (T. and W. Farmiloe, Ltd.), Col. H. C. L. Holden, R.A., F.R.S., M.I.E.E., H. Howard Humphreys, M.I.M.E.,

W. Rees Jeffreys, W. G. Lobjoit (W. and J. Lobjoit and Co.), H. Thomason Lyon, M.I.E.E. (Chairman Traffic Committee Westminster City Council), Douglas Mackenzie, A.M.I.M.E., C. C. Mitchell (the London Road Car Company, Ltd.), L. G. Oldfield (London Omnibus Owners' Federation), Arthur Paterson (Carter, Paterson and Co.), R. R. Robbins (Wild and Robbins), E. Shrapnell Smith, A. A. Campbell Swinton (the London and District Motor Bus Company), the Hon. Arthur Stanley, M.P. (Chairman Motor Union), W. H. Willcox (W. H. Willcox and Co., Ltd.), and Dr. Hels Shaw.

### YORKSHIRE.

THE Yorkshire Automobile Club has arranged further free garage for its members at the following garages:—Hull City Garage, North Street, Hull; T. Smurthwaite, Romanby Road, Northallerton; E. A. Colby, Trinity Yard, Dewsbury; Edgar Smith, Weymouth Street, Halifax.

### NORTH-EAST LANCASHIRE.

THE Burnley Automobile Club and the North-East Lancashire Club are to amalgamate forces, the members of the Burnley Club coming to that decision the other night. Should all the members of the Burnley club enrol themselves with the North-East, the latter will become an important club in the north of England.

The club is able to report that there are no police traps within the area of its influence.

### AUTOMOBILE ASSOCIATION.

THE Automobile Association during the Cordingley Motor Exhibition week enrolled sixty-six new members, whose subscriptions total £152 4s.

### BRITISH MOTOR-BOAT.

THE opening meeting of the season for this club will take place on the 5th prox., when there will be a cruise down and up the Thames, the Commodore, Admiral Sir W. Kennedy, in command. Races will take place at Oulton Broad on June 5th, and at Liverpool on the 8th of that month. There will be a cruise from London to Cowes on July 7th, and races off the Isle of Wight later in the same month. The Burnham-on-Crouch events are fixed for September.

### AUTO-CYCLE.

THE next Quarterly Trial of the Auto-Cycle Club will be held on Wednesday, the 25th inst., starting from Uxbridge at 9 a.m. over the following route:—Uxbridge, Beaconsfield, High Wycombe, Dashwood Hill, Wheatley, Islip, Banbury, returning via Bicester, Aylesbury, Berkhamstead, Chesham, Amersham, Beaconsfield, to Uxbridge. The times of the competitors will be taken up Dashwood Hill, and certificates will be awarded giving a record of the performances, and also reporting upon the following: (1) Accessibility, (2) hill-climbing, (3) ease of starting and control, (4) brakes, (5) silencer, (6) stand and luggage carrier. Entries close on Wednesday, the 18th inst., and the entrance fees are: Trade, one guinea; members of the Auto-Cycle Club and affiliated clubs, 10s. 6d.

Entries for the International Cup close on Wednesday, the 18th inst., at the following fees: Trade, for the first machine, ten guineas; each additional machine, five guineas. Private owners, not receiving payment from any person in connection with this event, two guineas.

Up to the time of going to press, forty-four entries have been received for the Land's End to John o' Groat's trial.

### LINCOLNSHIRE.

THE annual luncheon given by the Lincolnshire A.C. to inaugurate the season, held on Saturday, was of a somewhat novel character. The mayors of the towns in the county, the chairmen of the County Councils, the chairmen of the Rural District Councils and Highway Surveyors, and other officials were entertained. The guests were taken to Lincoln in cars, there being fifty cars at the Great Northern Hotel, the headquarters. Sir Hickman Bacon, Bart., president of the club, presided. Major J. A. Cole, J.P., in proposing "The Guests," described the club as more of an association for the encouragement of motoring. They were at the beginning of the new force, which would do as much benefit for the public as had railways. They had established the most sincere and hearty relationships between automobilists and the governing bodies of the county. The club would do all they could to promote experiments with new methods for road-making.

Mr. W. Embleton Fox, chairman of Lindsey County Council, in responding, said by accident or design the guests that day were the road-menders of the county, and thought there was a feeling of gratitude for favours in the past and anticipation for favours to come. He thought it was a good thing that the county authorities had a clean record so far as motorists were concerned. Motor-cars did not add to the amenities of the road, but he could say, from the action taken by the various authorities, the motorist had as much right to the road as they, and so long as drivers behaved like gentlemen and with due regard to the rights of other people, he thought they would get on very well together. He then referred to the absolute uselessness of the speed limit, and said that he detested the necessary corollary, which is the police trap.

Mr. W. Rees Jeffreys, answering for "The Motor Union," said they relied upon the promise of support. He thought they might be congratulated on the honour the chairman of their club, Major Cole, had attained by election as vice-president of the Motor Union. He was pleased to say that, having considered the case taken by the Lincolnshire Club, in which Dr. Millar was the defendant, and that a principle was involved, the Union had decided to defray the expenses of that case. They had found that the cost of motoring was twopence per mile, and their object should be to reduce this to at most three-half-pence per mile. Col. J. S. Ruston, Mr. A. C. Newsum, Mayor of Lincoln, Mr. A. A. Padley, and Mr. C. W. Pennell also spoke.

### HEREFORDSHIRE.

ENTRY forms are now available for the climbing competition on Frome's Hill, Hereford, on May 24th. Neither steam cars nor petrol vehicles of more than 35-h.p. will be permitted to compete. The distance to be covered (from the upper gatepost of gate on right side of Frome's Hill, starting from Ledbury and Bromyard main road, to cyclists' danger board at top) is 1,289 yards, and will be timed from a standing start to a flying finish. The total rise is 344.61 feet, the average gradient 1 in 11.22; at the steepest part it is 1 in 6.37. Capt. Inglefield will be the judge, Mr. A. Townsend starter, Mr. Quintin Miller marshal, and Mr. Wilfred Groom, of Wroxeter, Hereford, hon. secretary of the meeting.

### KENT.

THE annual general meeting of this club was held at the Loyal Star Hotel, Maidstone, on Saturday last, when there was a large attendance of members and friends. Mr. W. W. Willis, of Brasted Chart, took the chair, and after the passing of the report and accounts, which were very satisfactory, Dr. Firth, the chairman of the club, proposed that ladies should be eligible for members. Mr. Cobham seconded the motion, and after some discussion it was resolved that ladies should be able to become members, and so obtain the privilege of full membership to the Motor Union. Certain alterations in the rules to facilitate the procedure of the club were recommended by Mr. Kenyon and adopted. Mr. Willis proposed in a few words a vote of thanks to Dr. Firth (the chairman of the club), the members of the committee and the hon. sec. for the work done on behalf of the club, duly seconded by Mr. Bailly, and carried unanimously. Dr. Firth then proposed a vote of thanks to Mr. Willis for taking the chair that day, which was carried with acclamation. The following were elected for the ensuing year. Dr. Firth, chairman of the club; Mr. G. M. Kenyon, hon. sec. and treasurer. The committee for the year consists of:—Dr. C. Firth, Dr. Dowding, Dr. Tamplin, Messrs. A. Gurney Preston, A. Booth Hearn, A. H. Reed, T. H. Nash, J. E. Austin, Jesse Ellis, W. Willis, R. C. Morgan, and H. J. Fraser.

### BRISTOL.

THE annual general meeting of this club was held at the Royal Hotel, College Green, on Friday of last week, Mr. T. Ruding Davey presiding. The chairman stated that the report showed that much useful work had been done during the past year. The adoption of the report and accounts was carried unanimously.

THE Hon. Arthur Stanley, M.P., has been re-elected chairman of the A.C.G.B.I.

MR. H. AUSTIN has been elected president of the Birmingham Motor Cycle Club.

A MOTOR-CYCLE club is being formed for Leicester by Mr. J. Hughes Kirby Muxloe, Leicester.

MR. H. R. MAYO, St. George's Park House, Great Yarmouth, is forming a motor-cycle club for the district.

The South Herts Automobile Club, which has its headquarters at the Falcon Hotel, Waltham Cross, has issued a list of advantages of membership, which the hon. sec., Dr. H. W. Spaight, Holmewood, Waltham Cross, will be pleased to send to prospective members.

### MOTOR-CAR MISHAPS.

A MOTOR-CAR has been destroyed by fire in the motor garage of Baroness Gray, at 14, Bolton Mews, South Kensington.

AT Southwark an inquest has been held on the body of Henry Crowther. He was crossing the road at the Elephant and Castle when a motor-bus came round the corner into the Walworth Road at about two miles an hour. Startled by the sound of the horn the man went to step back out of the way of the bus, but he slipped on the greasy road and one of the wheels passed over his leg, causing injuries from the effect of which he died in Guy's Hospital. The jury returned a verdict of accidental death.

AT the inquest on the Rev. A. G. Baldwin, vicar of Burnopfield, who was killed whilst riding a motor-bicycle, by colliding with a young cyclist, a verdict of "Accidental death" was returned. The coroner commented on the danger of boys learning to ride on the main road. Had the lad been older he would have been held responsible for the fatality.

## MOTOR-BUSES v. TRAMWAYS.

At the A.C.G.B.I. last week, Mr. Edward Manville gave a valuable paper on the above subject, in the course of which he said:—The phenomenal development of the motor-bus within the Metropolitan area had produced such a burst of enthusiasm in the promoters of this system of traction, that he feared that an inflated view was being taken of the merits of the motor-bus as against the older and well-tried system of the propulsion of tramcars by electricity. In order that a fair comparison might be made the lecturer pointed out that it was essential in the first place to realise those conditions which were of primary importance in dealing with the problem of the transportation of large numbers of the public in crowded centres. There were two such main considerations: (1) What system would provide the travelling public with the best and cheapest facilities for reaching their destinations with the least discomfort and inconvenience to the non-travelling public; and (2) what system, whilst embodying the first requirement, was the most profitable to the promoters of the undertaking? In Mr. Manville's opinion the relative advantages and disadvantages of these two methods of traction may be summarised as follows:—

## MOTOR OMNIBUSES.

## ADVANTAGES.

1. Probably greater speed from point to point, owing to their being free to move about the roads, avoiding other traffic *en route*.
2. Ability to vary the service from one road to another, thus enabling the most profitable routes to be ascertained without loss of capital.
3. Ability to draw up by the pavement, so as to facilitate passengers entering or alighting without proceeding to the middle of the road.
4. The absence of any rail in the roadway.
5. Where the roads are exceptionally narrow non-interference with other vehicles desiring to stop by the pavement.

## DISADVANTAGES.

1. High cost of operation.
2. Great noise and corresponding inconvenience to other users of the road and residents.
3. Smell, and the prevalence of the smoke of burnt lubricating oil.
4. The ever-present danger of side-slip.
5. The danger of fire.
6. Vibration.
7. Danger to other vehicle users on the highway.
8. Unreliability.

## ELECTRIC TRAMWAYS.

## ADVANTAGES.

1. Lowest known cost of operation.
2. Great comfort, cleanliness, and good lighting.
3. Comparative absence of noise and vibration.
4. Reliability.
5. Absence of danger from fire and side-slip.
6. The great improvement of the surface of roadway.

## DISADVANTAGES.

1. Running on rails, and thus experiencing delay from other traffic.
2. Need for passengers crossing to the middle of the road when entering or leaving cars.
3. The need for rails in the roadway objectionable to other traffic.
4. In narrow roads interference with other vehicles desiring to stop by the pavement.

## THE AUTOMOBILE CLUB TRIALS.

THE trials organised by the Automobile Club, which were in progress during the past month, were concluded on Saturday. All the cars were made to run slightly over the 4,000 miles. The performance of the Dennis, which made no involuntary road-stops after 85½ miles of the first day's journey had been covered, establishes a new record for an officially observed run. The road tests began on March 1st, and amounted to twenty-five days' running. In brief, the performances over the whole trial were as follows:—20-h.p. Dennis car, non-stop throughout except on first day, when petrol filter choked at 85½ miles. The 36 in. and the 34 in. Collier tyres each made non-stops on twenty-two days, and the 815 mm. made non-stops on twenty-three days.

Lamps: Tail-lamps, Ryta and Hoult. Burnt well throughout. Went out only five times during entire run, due on two occasions to lack of attention to wick. Metallic Mirrors: Burnt well throughout. Went out only six times, on one occasion due to jolt from back spring of car breaking. The Worsnop headlights were unfortunate in suffering from obstruction of the pipes and damage to burner, otherwise they burned well.

The speedometers were tested over 2,000 miles, one batch running the first half of the trial and the remainder the second. The Vulcan was removed for alteration of the bracket, but had non-stops throughout. The Warner lost only five minutes for adjusting of the driving gear, and once the flexible shaft broke, otherwise non-stops throughout. The Kirby and Cowey Recorder made non-stops throughout except that each once broke its flexible shaft. The Staunton made non-stops all through, except for breaking its flexible shaft on the 27th ult., and not recording on the 28th ult. The Elliott, Jones, Gratz, and Cowey Indicators made non-stops every day.

## SCOTTISH RELIABILITY TRIAL.

For these trials, to be held from the 13th to the 16th June, the following entries have already been made. These are arranged in the order of entry, which is the order of start from Glasgow on June 13th. Entries at ordinary fees close on May 2nd.

Name.	Car.
The Albion Motor Car Company, Ltd., Glasgow	24-h.p. Albion Tonneau.
The Albion Motor Car Company, Ltd., Glasgow	16-h.p. Albion Tonneau.
Claud Hamilton, Ltd., Glasgow	Gladiator.
John Hunter, Bearsden	12-15-h.p. New Arrol-Johnston.
The New Arrol-Johnston Car Company, Ltd., Paisley	12-h.p. Arrol-Johnston Dogcart.
John S. Napier, Paisley	16-h.p. Arrol-Johnston.
Wm. Beardmore, Alexandria	24-30-h.p. New Arrol-Johnston.
Thos. Shaw, Dundee	25-h.p. Siddeley.
The Gladiator Company, London	24-32-h.p. Gladiator.
Thos. Chas. Pullinger, Beeston	16-20-h.p. Beeston Humber.
The Kennedy Motor Company, Ltd., Cathcart	12-h.p. Darracq.
Ed. Powell, North Wales	10-12-h.p. Coventry Humber.
The Sunbeam Motor Company, Ltd., Wolverhampton	16-20-h.p. Sunbeam.
Western Motor Company, Glasgow	10-12-h.p. Argyll.
W. M. Wallace, Denny	12-14-h.p. Argyll.
Argyll Motors, Ltd., Alexandria	14-16-h.p. Argyll.
Western Motor Company, Glasgow	16-20-h.p. Argyll.
Rennie and Prosser, Ltd., Glasgow	15-h.p. Siddeley.

A French Motor 'Bus Service. A Snapshot from Honfleur.

T. Masui, London	14-20-h.p. "Germain."
Buchanan Shiell, Perth	20-30-h.p. Maudslay Phaeton.
R. L. Jefferson, Coventry	Rover.
J. K. Starley, Coventry	Rover.
C. S. Rolls and Company, London	20-h.p. Rolls Royce.
C. S. Rolls and Company, London	30-h.p. Rolls Royce.
Swift Motor Company, Ltd., Coventry	9-10-h.p. Swift.

## SEQUEL TO A MOTOR-CAR COLLISION.

In the King's Bench Division, before Mr. Justice Lawrance and a special jury, Mr. James Gourlay, an auctioneer, residing at Isleworth, claimed damages from Major-General Sir Henry Edward Colville for an accident to himself, his horse, and governess cart, due, as he alleged, to the negligence of the defendant's driver.

The plaintiff's case was that on Whit Monday, 1904, he was driving a governess cart on Bell Hill, near Hampton Court, accompanied by two friends. Sir Henry's motor-car, containing Lady Colville, another lady, and the Earl of Kintore, ran into the horse, knocked it down, broke the shaft, and damaged the harness to such an extent that a new set had to be obtained. The horse was cut about the legs, but fortunately the occupants of the cart only sustained a rather severe shock.

The defence was that the accident was caused by the gross negligence of the driver of a pair-horse wagonette. As the car reached the Bell Hotel yard the driver of the wagonette pulled into the yard without warning, thus completely blocking the roadway. The driver of the car, to avoid a collision, did the only thing possible; he turned to his wrong side, and to avoid other traffic he drove the car on to some waste land. In doing this the driver was unable to avoid a collision with Mr. Gourlay's vehicle, which was coming down the hill at a

smart trot, with the result that the cab was slightly cut and other slight damage was done. The Earl of Kintore, Lady Colville, the chauffeur, and others gave evidence to this effect.

His Lordship, in summing up, referred to the items of damage claimed, which he said were exaggerated. They were a disgrace to the person who put them forward, and a disgrace to the person who perpetuated them.

The jury returned a verdict for the plaintiff, with £5 damages.

#### MOTOR VAN v. CAB.

At the Clerkenwell County Court, Messrs. A. W. Gamage, Ltd., sued Owen Macklin, jobmaster, of Fulham, for £3 3s. in respect of damage to a delivery van. Plaintiff's driver, Frederick Lawes, said that on January 2nd he was returning with his motor delivery van from Hammersmith. When he had passed Hyde Park Corner he noticed two stationary cabs in front of him. Just as he approached the horse of the second cab suddenly pulled out. He sounded the horn and applied the brake, but the sudden action of the cabdriver made it impossible for him to avoid a collision. He ran into the cab, and as a result one of the motor-car's new lamps was broken. The off-side stay was also damaged. There was a counter-claim for damages in respect of the collision. The amount was £3 18s. The judge found in favour of plaintiffs both on the claim and counter-claim, with costs.

#### PUBLIC MOTOR SERVICES.

THE Dundee authorities are considering the advisability of applying for powers to enable them to run a motor-omnibus service.

THE Brighton Watch Committee are recommending the Town Council to agree to the proposed extension by the Brighton, Hove, and Preston United Omnibus Company, Ltd., of the motor-bus route between Hove Station and Old Steine. The new proposals provide for the running of four motor-omnibuses to Kemp Town.

A SERVICE of motor-omnibuses is being proposed in order to link Nottingham with Hucknall, Long Eaton, Ilkeston, Daybrook, Arnold and Netherfield. Those serving Hucknall would start from the tram terminus at Bulwell; those running to Arnold would begin at Sherwood; and those for Radcliffe would start and finish at Trent Bridge.

THE full summer service of motor-omnibuses has commenced at Eastbourne.

THE London and Westminster Motor Omnibus Company has been registered with a capital of £20,000.

THE Manchester Tramways Committee have purchased three Leyland motor-omnibuses to use by way of experiment this summer on the services from Palatine Road to Cheadle and to Northenden.

#### POLICE TRAPS.

A POLICE TRAP about half a mile south of Edgware is in fairly frequent operation, and early on Monday morning a well-known London motorist was caught therein. The police in the vicinity of Leeds are becoming active; three traps were noticed on Saturday last by the chairman of the Yorkshire Automobile Club (Mr. E. H. Hepper), who motored from Leeds to Harrogate for the purpose of acquainting himself with all the streets that the Corporation is desirous of placing a speed limit upon. The main traps are at Moortown and Spacey Houses, on the Leeds and Harrogate road. The Moortown trap extends from Moortown Church (an officer being stationed in the churchyard) to the cross roads some 220 yards away. The Spacey Houses trap is about two miles from Harrogate, and extends from the top of the hill just beyond the Spacey Houses Hotel to the foot of Humphrey Bank. There is a very active police trap at Potter's Bar, on the Great North Road, just by the station. There is also one on the Edgware road and two in the Biggleswade district. About 400 yards on the Ripley side of Wisley there is a police trap, the "trappists" in connection with which conceal themselves behind a tree.

THERE is every probability of police traps being started again in the Crawley district, on the main London to Brighton road, over distances which proved very useful to the police under the old twelve miles per hour limit. Motorists would therefore be well advised to take care approaching Crawley from about two miles out on the London side and half a mile on the Brighton side of the town.

MOTORISTS should be very careful when passing through the following roads in Kensington, where police traps are in constant operation:—High Street, Kensington, Church to Addison Road Railway Bridge, Earl's Court Road, Melbury Road, Addison Road, Holland Road to Uxbridge Road; and Holland Villas Road.

#### CASES AGAINST MOTORISTS.

AN interesting point to motorists was brought before the Kingston-on-Thames magistrates when Mr. F. W. Webb, of Barnes, was summoned for using a motor-bicycle without having registered the machine. The defendant had taken the registration number off an old machine and attached it to a new one. This it was pointed out was illegal, as according to law each machine must be registered. The importance of the point was emphasised by the fact that unless the law was carried out registration was useless for purposes of identification. Mr. Webb had acted in

ignorance of the law, and the magistrates inflicted a nominal penalty of 10s.

MISS MARGARET SCOTT-ELLIOTT, of Chelsea, was the defendant at Brompton County Court in an action for damages brought against her by Sydney Passy and Geo. Dix. It was alleged that the defendant, while driving a 15-h.p. Panhard on the Kempton road ran into the plaintiffs' trap. That vehicle, which belonged to Passy, who was uninjured, was smashed, and the horse hurt. Dix was crushed beneath the overturned trap. Miss Scott-Elliott, who was firmly convinced that the accident was due to Passy's carelessness, said she had her invalid sister, her nephew, and her mother, an old lady of ninety-four, in her car on December 26th. She did not go to see if Dix were killed or not because she had her own party to look after. In returning a verdict of £50 for Dix and £25 for Passy, the jury registered its opinion that the defendant might very properly have taken a little more kindly interest than she did in the injured man Dix.

HUBERT GRAY, of Sydenham Park, S.E., summoned at Shoreham denied driving a motor-car to the danger of the public, along Albion Street, Southwick, on the 18th March. P.C. March said that about 6.40 p.m. on the day in question defendant drove a motor-car along Albion Street at a speed, he estimated, of about twenty-two miles an hour. Defendant gave no warning of his approach, and there were complaints. When he signalled driver to stop, defendant had some difficulty to do so, owing, witness thought, to the greasy condition of the roads. Defendant cross-examined witness, and then asked for an adjournment as his principal witness was ill. The evidence of six witnesses on behalf of the police was taken first, however. Defendant said he did not see anybody on the road. He had a very good reason for driving slowly through Southwick, as, last year, his brother was stopped there and heavily fined. He always drove with caution through that part, because he knew the constable on duty there, and did not think he was too well disposed towards them. Defendant, questioned, said he still asked for an adjournment. He wished to call the lady who was with him in the car. The Bench decided that that was not sufficient reason for an adjournment. A penalty of £7 13s. costs, and £1 13s. 6d. witnesses expenses was imposed.

AT the Limerick Quarter Sessions, before Judge Adams and a county jury, Martin Carroll, a farmer, sought to recover damages from Mr. James Goodbody, for injuries alleged to have been sustained by plaintiff owing to the negligence of defendant, on July 29th. Plaintiff deposed that as he was driving a horse and cart round a corner Mr. Goodbody's motor-car came rapidly round and frightened plaintiff's horse, with the result that he was thrown from the car and his leg broken. After hearing evidence His Honour, in summing up, said there was no doubt that the motor-car frightened the horse, but that would be no cause of action. He (His Honour) hated motor-cars with a bitter hatred, either as a method of conveyance or a source of pastime, but the owners had certain rights which must be respected. The jury found that there was no negligence, but that the motor-car was the cause of the accident. His Honour said that was a verdict for the defendant. It did not debar the plaintiff from the right to appeal.

AT the petty sessions at Stevenage, on Thursday last week, Arthur Cole appeared to answer two summonses; first, for driving a motor-car at a speed dangerous to the public at Stevenage on February 10th last, and secondly, for allowing the back number plate to be obscured. Mr. Staplee Firth, who defended, submitted that there was no case to meet, as no witness was called to say that he or she was imperilled or endangered by the speed of the car; indeed, the witnesses for the prosecution admitted on cross-examination that they were not, nor was anybody else, endangered, neither were there any passengers or vehicular traffic on the road to be endangered, and this was even borne out by the police themselves. The Bench ultimately adopted this view, and dismissed the summons for driving to the danger. On the second summons, for allowing the number plate to be obscured, Mr. Firth submitted to the Bench that this was a trivial offence, and as there was a severe storm at the time it was impossible to keep the plate clean, and called evidence to prove that the plate was cleaned at Cambridge. The Bench, however, convicted and a fine was inflicted of £5 and costs.

Place.	Summoned for	Result.
Grantham ... ..	Driving dangerously	Dismissed.
Eddisbury ... ..	Reckless driving	£6 10s.
Gloucester ... ..	Fraudulent use of motor-car mark	£3, etc.
Heanor ... ..	Dangerous driving	Dismissed.
York ... ..	Dangerous driving	Dismissed.
Briggwater ... ..	Driving a motor-lorry without rear light	£1, etc.
Dublin ... ..	Excessive speed	£10, etc.
Eccles ... ..	Excessive speed	20s., etc.
Kingston ... ..	Exceeding legal limit	40s., etc.
Marylebone ... ..	Furious driving of motor-bus	£5, etc.

THE Kennard Motor Company, Ltd., have opened a motor garage in the City Road, Cardiff.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

### Easter Experiences.

EASTER properly opens the touring season of the year, and many motorists whose ardour was cooled during the winter months will be seen upon the road making their first long journey of 1906. From the reports on the condition of the roads in various centres, which we publish elsewhere as a regular feature of the *M.C.J.*, it will be seen that the local authorities are recognising their duties to travellers, and that, as a general rule, the season of road repair is nearly over and good running may be expected. We shall be glad to hear from readers who have interesting experiences during Easter, either with police, or roads, or hotel-keepers, so that attention may be drawn to any delinquencies that may be noted, or praise bestowed where such seems due.

### Supply and Demand.

THE coming of the holidays has been characterised by a wonderful spurt in the inquiry for cars, and, as the "Standard" says, "with the close of the show season buyers and sellers of motor cars are face to face with a situation which has become chronic at this time of the year for many seasons past. Day by day and week by week the number of unfilled orders grows larger and larger as the promises of early delivery mature, only to meet with disappointment. The eleventh hour flood of orders during the recent Cordingley Show has only served to increase the congestion, and it has now become a question whether the impatience of buyers will be able to hold out until the physical possibilities of factories catch up with the promises made by agents and salesmen months ago." This is a decidedly irksome condition of things for many concerned in the British industry.

### Help or Obstruction.

OUR Comment of last week on the case of the kindly-disposed gentleman who sought to prevent other persons from breaking the law prepared motorists for reading the report of the case, which was heard just after we had gone to press. He has been charged with obstructing the police, whereas he was only assisting the spirit of the law. Fortunately the magistrate was not inclined to adopt the police view without thought, and his decision will now be awaited with interest.

### Experiments in Dust Prevention.

THE surveyor to the Farnham (Surrey) Urban Council, who has during the past two years carried out a series of experiments for dust prevention, has presented an interesting report to the Council. He stated that the cost of treating 800 super yards with tar macadam was £120, whilst the expenditure on 12,200 super yards of tarred and oiled surface was only £101 10s. 8d., so that tar macadam cost eighteen times as much, and at the same time had not proved a success in any sense of the word, there being no evidence that tar macadam would

improve or prolong the wear of the surface of the road thus treated. The tarred surface, on the other hand, had effected a considerable saving in scavenging and road maintenance, and for the second year the saving effected by the process had more than paid for the cost of treatment. The materials used in the mixture included tar, grit, lime, pitch and oil, an improvement being effected by occasionally dressing or sprinkling the surface with a mineral oil. From an hygienic point of view the surveyor pointed out that a marked diminution of infectious disease in the town almost exactly synchronised with the time during which this process had been employed, and seeing that the period covered nearly two years there was a strong inference that the treatment tends to prevent the spread of infection. The experiments with tar macadam had not been successful, as in the wet weather the sections treated had been exceedingly dirty, and had required a great deal of scavenging, whilst in the dry weather the surfaces were dusty and somewhat unsound. A section of another road was treated with a patent dust preventer. He estimated the cost of this to be £60 or £70 per mile for application only, and the great drawback was its destructive action on the surface of the roads treated. The process would necessitate all surfaces treated by it being retailed on the first approach of winter.

### A Hint to Yorkshire Motorists.

THE Town Council of Richmond (Yorkshire) applied recently to the Local Government Board, through the County Council of the North Riding of Yorkshire, for the closing to motor traffic of a portion of the road known as Quaker's Lane, in Richmond, this road being on the direct route from places on the east of the town to Swaledale, which lies to the west. As the result of representations made by a deputation from the North Eastern Automobile Association, the Town Council have agreed to withdraw their application for the present, and are removing the existing direction notices which have tended to send the traffic through this particular road, and are placing the same or similar notices on a parallel road, which is much wider, and very slightly longer in distance. The Association desires through our columns to urge all motorists passing through Richmond to very carefully observe any direction notices they may see, and not to pass down this portion of road, which there is no necessity to do in view of the alternative route.

### The Harrogate Inquiry.

AFTER having been the *locale* of a provincial gathering of the Motor Union, we should have thought the automobile education of the town of Harrogate would have been complete, and that motorists would have been welcome guests in a place which relies upon visitors for a great measure of its prosperity. Surprise has been expressed that the authorities should have made application to the Local Government Board for power to restrict the speed of motor-cars in several streets to six miles an hour. Headed by the Motor Union, the Yorkshire Automobile Club and the Harrogate

branch, earnest opposition has been organised to the proposal, and at the inquiry by the Inspector last week the anti-motorists made a poor defence of their proposals. Since the Motor Car Act came into force there have only been seven prosecutions in the borough, which seems clear testimony as to the needlessness of the suggested restraint. Mr. Rees Jeffreys said that the application had raised a great deal of interest and opposition amongst automobilists, and of all the applications put before the Local Government Board the present one was absolutely the most unreasonable. They had known towns, such as Dover, Winchester, Bury, Todmorden, and others put forward applications for ten-mile limits for streets which were far busier than those in Harrogate, and in every case the application had been refused. A similar fate should befall the Harrogate application.

#### London to Monte Carlo.

THOUGH he has retired from the racing arena, Mr. C. Jarrott still revels in adventures by automobile, and on his trusty Crossley car has again drawn attention to the reliability of the modern motor and the joys of the up-to-date car. He has succeeded in beating his own schedule on a journey from London to Monte Carlo—an exploit in travelling that is really

**Mr. C. Jarrott starting from the Automobile Club.**

notable. The intention was to negotiate the distance in 48 hours, including the time occupied in crossing the Channel and in embarking and disembarking the car. Starting at 8 a.m. on the 5th inst. from the Automobile Club in London, Mr. Jarrott set out on his 40-h.p. Crossley prepared to make a record run over the thousand miles that separate the British capital from the southern resort. Keeping well within the speed limit the trip to Folkestone was uneventful, the car appearing as fit for the journey as was the driver.

#### On the Other Side.

Two hours after noon Boulogne was left, and all went well till Beauvais was reached at 4.50, half an hour sooner than had been anticipated. There an incompetent guide misdirected the party, and a run of fifty kilometres was made on a wrong road. Travelling through a cold stinging rain which pelted on car and driver alike through the night, the roads were found to be very heavy, and it was with some satisfaction that Mr. Jarrott and his friends found themselves at Dijon by 5.20 a.m. the next morning. Five hours later they were at

Lyons, where the weather showed signs of a welcome improvement. From Lyons to Valence on to Orange and Avignon the roads improved, and travelling was at a great pace. By the time it was again dark they had got to Frejus. The last piece over the Esterelles was very trying, the twists and turns of the mountain road making it hard work, and then on they went through Cannes and Nice to Monte Carlo, doing the whole run in 37½ hours—an extraordinarily good trip, and one of the most successful drives that Mr. Jarrott has ever undertaken.

#### A Notable Performance.

WITH regard to the exploit it would have been impossible to have done the journey in the time chronicled had there been the slightest trouble with the car, which, the driver says, "went through like a dream and ran like a racing car." The engine ran continuously for over 31½ hours, and they averaged 45 miles per hour over one part of the distance—needless to say on the other side of the Channel. Mr. Jarrott was at the steering wheel the whole of the way, 900 miles by road—a piece of endurance only to be gauged by comparison with a race at top speed for thirty consecutive hours. The Continental tyres were a great success, and, all things considered, the run was a triumph for the Crossley car and its driver. When we remember that, providing the railway people maintain exactitude all along the line, Monte Carlo cannot be reached from London in less than 28 hours, the exploit appears all the more noteworthy.

#### Change of Address.

THE case at Woolwich, reported on another page, suggests a note of warning to motorists who may have removed from the place of residence they occupied when originally registering their vehicle. It follows in its main lines a similar case recently heard at Bow Street, where the magistrate decided, as did the stipendiary at Woolwich, that a change of address "affects the accuracy of any particulars entered as respects that car in the register of motor-cars,"—to quote from Article V. of the Regulations of the Local Government Board. Until the Bow Street case there were many owners of cars who had carefully studied the Act without discovering any clause insisting on acquainting the authorities with the change of address. In future legislation such a necessary provision will have to be clearly stated.

#### Cause of Accidents.

TWO motor-car accidents which have lately taken place in the south of England have resulted in coroners' inquiries. Without setting forth all the details, we may mention that the juries have exonerated the drivers in both instances—upon which the solicitors for the motorists, Messrs. Kenneth Brown and Co., are to be congratulated. In each case the unfortunate victim deviated from his ordinary path with dire results, and in one of the accidents it was clearly shown that the deceased took no heed of the warnings given by the driver. In nine cases out of ten it may be taken for granted that the carelessness of the pedestrian is the cause of collision.

#### Some Statistics.

UNFORTUNATELY Government figures are generally belated, and the return which the Home Secretary has just furnished to Mr. T. Davies, M.P., with regard to the deaths caused by mechanically operated vehicles in England and Wales is as dilatory as usual. It deals only with the years 1903 and 1904, with totals of 141 and 177 respectively. As being nearer our own time, we give the following analysis of those for 1904, which shows that the argument as to the safety of the tram as compared with the ordinary motor vehicle has little foundation. The accidents recorded were as follows:—Motor-car, 59. Motor-cycle, 16. Motor-omnibus, 2. Electric tram, 55. Steam tram, 2. Traction engine, 29. Motor dray, wagon, etc., 9. Steam roller, 5. Total, 177.

**Conversations  
from the  
Clouds.**

A BALLOON race which promised to be of an exciting nature took place on Saturday in London. One balloon was that of the Aero Club, which was in charge of Mr. C. F. Pollock, having as passengers Mr. Frank Butler, Mr. G. F. Pedley, and a lady, the starting-point being the Crystal Palace. The other was a new balloon constructed by Messrs. Gaudron, in charge of the Hon. C. S. Rolls, with Captain Corbet, Mr. J. Williams, and Professor Huntington as passengers. It made its ascent from the Wandsworth Gas Works. Owing to the direction of the wind Mr. Pollock's balloon was given forty minutes' start. When the excitement of the race was at its height it was found that the club balloon had expended nearly all its ballast, and a descent was made in an enclosure adjoining the Guards' polo ground at Wimbledon. Mr. Rolls's balloon travelled for two hours without exceeding an altitude of 500 ft., and a constant conversation was carried on between the aeronauts and the villagers. The latter, thinking the balloon was descending, ran after it with great energy, but one by one they stopped from sheer exhaustion. The descent was made in

The resistance offered to this by the weight of the car caused a bent crankshaft, a result not always ascribed to this cause, but sometimes loosely regarded as the effect of a collision.

**Action against a  
Tram Company.**

A CASE in which the owner of a horse-drawn vehicle has obtained a verdict against a tramway company for damages to a van caused by skidding against the tram lines, is of interest to motorists, who continually run risks consequent on the neglect of tramway authorities in keeping their tracks in reasonable repair. The evidence for the plaintiff was to the effect that the tramline was protruding above the roadway for a distance of fifty-five feet. The vehicle skidded, with the result that the axle was bent and the wheels cut into the sides of the van. Police evidence was to the effect that the track was in good condition, but the county court judge at Brentford came to the conclusion that the depth of the sunken wood about the lines was such as to render the defendants partially liable for the accident, and consequently gave a verdict against them.

Bulstrode Park, near Beaconsfield, the property of Sir John Ramsden, at 6.30 p.m., and several of the household were given captive ascents by means of trail-ropes.

**Bent  
Crankshafts.**

BEFORE the Coventry Engineering Society Mr. T. W. Lanchester has been explaining some points of motor-car construction, including the gyroscopic action of the flywheel. In connection with this he said that in the usual system of transmission, popularly known as the Panhard, where the engine crankshaft is set longitudinally in the frame, the rotation of the flywheel had no effect upon the steering of the car. When, however, the steering direction was suddenly altered, such as is the case in swinging rapidly round corners, or in trying to avoid collisions, the gyroscopic tendency of the flywheel was to rotate the flywheel about a transverse axis, with the result that, according to the direction of steering, the car tried, as he termed it, "to stand on its back legs," the opposite direction of steering tending to make a car stand on its head.

**The Essex Club.**

FOLLOWING our usual custom of calling special attention to the inaugural meets of new clubs, we make special mention of the successful run of the Essex County Automobile Club on Saturday last, the rendezvous being the county town of Chelmsford. Elsewhere we mention the names of those who were present at what was a really enjoyable function, and which should have a splendid effect upon the membership of what is destined to be a very important organisation in the eastern counties.

**A Welsh Trap.**

MOTORISTS in South Wales must beware of police traps; this southern form of persecution having now penetrated into the Principality. The Hon. Stephen Coleridge and several other gentlemen driving cars have just been captured in a trap at Coedkernew, where "a measured half-mile" is worked by means of police constables and cheap stop-

watches. One of these "experts" said, in reply to questions from the magistrates, that, with the exception of 140 yards about the middle of the length, the whole of the distance could be seen from where he stood. Witness was questioned with reference to his stop-watch, and he illustrated the method of timing. The watch in its present condition was not reliable, because it had recently been worn by a man playing football, but on the date in question it was quite dependable.

#### Co-operation and the Motor-Car.

THIS week has seen the inauguration of a new system of business in the automobile movement—an adaptation of the plan pursued with so much success in the Civil Service Stores, and also among the operatives of the North of England. In both the latter cases economy in cost has resulted to the customer, while the price obtained by the producer has not necessarily been lessened. The gain by bulking orders, and so eliminating some of the expense of isolated trade, has been a direct reduction of expense, resulting in a more satisfactory condition of things. The introduction of a combination of these plans into the motor-car trade will be watched with interest. The Automobile Co-operative Association, Ltd., has been registered under the Provident and Industrial Societies Act, by which the amount which each shareholder can have in the society is limited to £200. Those who invest money elect a committee of management and generally direct affairs.

#### A New Scheme.

So far as the development of the scheme is concerned, we are assured that it is likely to be welcomed by trade and public alike. Representatives will be appointed in various towns, and these will render assistance in the way of repair work, guidance on routes, and similar matters, to any members of the Association requiring such help. At the inaugural luncheon held on Monday to launch the movement, Mr. J. Walker, M.I.C.E. (a director of Robert Stephenson and Co., Ltd.) said that the Association would place its members in a position to buy cheaply, and to know exactly what they were buying. It would also be of service to the manufacturers, the factors, and even to the small dealers in provincial towns or villages. To the manufacturer who could secure his manufacturing profit by dealing with the Association, they offered the advantage of immediate payment and absolute security. To the factor who, representing foreign houses or others, was willing to be satisfied with a moderate merchant commission, they gave a similar advantage. The development of the Association will be regarded with interest by all concerned in the motor movement.

#### The Motor Union Defence Fund.

THE demands upon the Union Defence Fund are heavy and continuous. The extent, to which the Union is able to grant financial assistance in legal cases is, of course, dependent upon the manner in which automobilists contribute to this fund. During the last few days grants amounting to over £120 have been made from the fund. These include £30 towards the expenses of an appeal against the decision of a High Court jury in a civil case in which heavy damages were awarded against a member; a grant of £20 towards the cost of a successful application to the High Court to quash a conviction on the grounds of bias and prejudice on the part of the magistrates; a grant towards the expenses of a member of the Union who had successfully defended a charge brought against him of driving to the danger of the public; a grant towards the cost of the Local Government Board inquiry into the application of the Harrogate Town Council for a ten-mile speed limit; and the expenses of an appeal against the conviction of a member by the magistrates at Stevenage of allowing the index marks of the car to become indistinguishable, when it was shown that all reasonable precautions had been taken by the driver.

#### The Law of Mechanical Traction.

DOUBTLESS the general feeling that there will be no fresh legislation this year with regard to automobiles has encouraged writers on the subject to continue their expositions of the law as it stands. A new volume on the subject of "The law of heavy and light mechanical traction on Highways in the United Kingdom," has been published by Sir Isaac Pitman and Sons, Ltd., the authors being Messrs. C. A. Montague Barlow and W. Joynson Hicks, whose collaboration has resulted in an important volume. The first part consists of nine Acts of Parliament, including the two Motor Car Acts, with notes; then follows a summary of the cases decided in England and Scotland, an appendix containing all the various Orders which have been promulgated by the Local Government Board in accordance with the wishes of Parliament. As a work of authoritative value the volume has considerable value.

#### The Cab Radius.

WITH the passing of the crawling horse the narrow confines of the present cab radius in London will disappear, and the Metropolis will be regarded as an entity by those who wish to reach a given spot in a given time. The arbitrary division which has encircled London with a four-mile circle has long since been an anachronism, but none have thought it possible to interfere with so ancient a boundary. But the coming of the motor-bus, to be followed by the cab of the same variety, will change present arrangements. Now that travel has become reasonably speedy the four-mile radius will seem as confined to the motor cabby as is the orthodox glass globe to the familiar goldfish. The radius will have to be extended so that the occupant of the motor-cab may be entirely independent of tube, tram, or train, and pursue his journey to the end at a reasonable fare and in reasonable time. When the radius is extended there will be room for the 11,000 cabs now meandering within the charmed circle. Or will the motor have become the successor of the horse by then?

AMONG recent candidates for the driving certificates of the A.C.G.B.I. have been several members of the Metropolitan police.

MESSRS. DENNIS BROTHERS, LTD., have just completed three motor-omnibuses to the order of the Southend Motor Omnibus Company. The vehicles went down by road on Wednesday in order to be ready for the service, which commences on Good Friday.

WE were among those who were favoured with a view of the Boat Race on Saturday last from Messrs. Thornycroft and Co.'s works at Chiswick. The firm had gone to a great deal of trouble in preparing for its visitors, and the interest was increased by a display of the various sizes of Thornycroft petrol engines for motor-car and boat propulsion purposes.

CAPTAIN KAYSER conducted our representative through the Austin Motor Company's works at Longbridge, near Birmingham, the other day, who found this firm very busy getting their new models through. The factory is an extensive one, well lighted, and is all on the ground floor. Being situated on the main Birmingham and Bristol road, they have fitted up a large repair shop. The company intend making everything in connection with their cars on their own premises, including body building, wheel building, etc.

THE Granville Motor Engineering Company, of which Mr. H. J. Doughty is proprietor, is attaining distinction with motorists in southern London. As specialists in overhauling cars and repair work much useful experience has been gained, which is ever at the disposal of new clients, while the opening of the garage and showrooms at 132 and 205, Clapham Road, S.W., is an event of more than local importance. With increased facilities for garaging cars the company should now become even better known in metropolitan circles.

## MOTOR-'BUS MATTERS.

SOMETHING of the early days of the railroad is recalled by the advance of the motor-'bus, and, principally in London, companies to further the new locomotion on the highroad are following each other with boomlike celerity. Questions are being asked in Parliament, where the Home Secretary, Mr. H. Gladstone, assures the country that opportunity of controlling motor-omnibus traffic will have to be found in connection with future Bills relating to London traffic and to motor-cars; the borough councils of Holborn, Westminster and Marylebone are asking committees to consider the ways of motor-'bus drivers and the vibration of their vehicles; scientific societies are gravely discussing the advantages of motor-'buses over tramways, and the points where the latter gain over the former; the public is becoming a little scared at the rapid advance of the new form of traction, while enjoying the exhilaration associated with speed; and now the coroners are darkly suggesting that the advent of the motor-'bus opens up new considerations to which the public authorities will have to give heed.

In drawing attention to some of the problems gathering around the motor-'bus, we would emphasize the fact that those at present in service do not represent the Omega of the matter. As the gears grind harshly while the 'buses travel along the streets, all must feel improvement is necessary; the greasy state of the roadway where the 'buses stop and start suggests a new danger of the streets; the racing that undoubtedly takes place on certain routes reveals the want of a code of conduct among drivers. And so long as several companies are running on the same lines of traffic this latter evil is likely to continue in a more or less marked degree. Then, too, the question of tyres, with resiliency and non-skidding as factors of importance, has yet to be settled, and the cost reduced to within profitable dimensions. Even the most determined advocate of the motor-'bus must feel that while the future personal traffic of the streets will be carried by such vehicles, the whole matter is still in the experimental period. Mechanical details have to be perfected, and until these reach more nearly to the final stage financial schemes should be carefully launched and as charily scrutinised before being endorsed by the public.

Then, too, the matter of driving must be regarded with greater concern than has been the case. A woman was killed the other day by being knocked down by a motor chassis, and at the inquest it transpired that whilst endeavouring to pass two other vehicles the driver of the chassis "lost his head," and, dashing on to the path, knocked down and ran over the deceased. The pace was stated to be about six miles an hour. The driver, who had been engaged in driving a horse-'bus, and was out for instruction under the charge of a competent driver, had only been on the vehicle on two previous occasions. The instructor said that he had no control over the steering gear. The jury returned a verdict of "Accidental death," adding a rider that the company should see that there was some arrangement by which the instructor could have some control over the motor when a learner was steering. They also thought that a longer period of instruction was necessary before a learner should be permitted to drive in a busy thoroughfare. Of course, this case is too isolated upon which to found a general indictment; but it suggests the question as to whether the crowded thoroughfares of London are suitable training grounds for motor-'bus drivers. Our own view is that such work should be done in the suburbs, and not until the driver has become proficient in controlling his mechanism should he be let loose upon busy roads. This point, too, is recognised by all who are engaged in putting such vehicles into service.

Last week we gave Mr. Manville's comparative statement of the *pros* and *cons* of the motor-'bus and tramcar. Some further opinions may be useful to those readers who are following the subject with care. According to Mr. Campbell Swinton the cost of tyres is being reduced, and has lately fallen from 2d. to 1½d. On the other hand, Mr. Schenk declares that those firms that had contracted for tyre maintenance at 2d. per car mile had

lost money, the only gain being the experience that has enabled them to produce more durable tyres. Experiments must be continued, and we should like to hear of more on similar lines to those made by Mr. G. de Preme, who found vibration quite disappear on such bad roads as that at Bow Bridge, between Middlesex and Essex, when pneumatic tyres were fitted on the back wheels.

The importance of carrying out further trials in this direction is apparent when we remember that the Highways Committee of the London County Council is considering the advisability of applying to Parliament next year for powers to run motor-omnibuses as feeders to its tram system, and that a Committee of the House of Commons have granted a concession to the Todmorden Corporation, giving power to provide and run motor-omnibuses within and beyond the borough. Although the Lancashire and Yorkshire Railway Company, which pays heavy rates to the borough, strongly-opposed the measure, the Committee have granted the powers asked for, excepting those which dealt with a service outside the borough. They have fixed the capital of the corporation's service at £6,000, with power to apply to the Local Government Board for any further sums which may be necessary for the undertaking, providing they show that it is working on a paying

The 20-h.p. worm-driven Daimler Car which established a new non-stop record in the recent Tyre Trials.

The vehicle made a non-stop throughout the 4,000 miles with the exception of 1½ min. lost in the first 86 miles through the petrol pipe choking. By the courtesy of the A.C.G.B.I., the car was allowed to run a further 86 miles under official observation; so that it now holds the unique record of 4,000 miles without an involuntary stop of any kind.

basis. This decision will be communicated to 800 councils throughout the country, and scores of Bills on similar lines will doubtless be promoted.

All things considered, a few main points may be clearly established. Firstly, the preponderating part that the motor-'bus will take in the street locomotion of the future; and, secondly, private companies will have the competition of municipal services in many places. The latter consideration should be fully recognised by those interested in the flotation of companies. Much remains to be done, both with regard to tyres, mechanical details, and drivers. The movement is young; hence the great need for caution and the insistence with which those responsible for existing services must impress upon their drivers the necessity of cautious driving and the avoidance of the risky running and racing that goes near to mishap. A few collisions in the streets would lead to panic legislation. Upon the behaviour of the men during the present year depends the development of the motor-'bus in the future.

GENERAL BOOTH's next motor trip will take place in the month of August, starting from Inverness and proceeding by the west coast route into England and on to Plymouth.

## A FARMER TURNS MOTORIST.

HOW Mr. Poskitt bought a motor-car is pleasantly told by Mr. J. S. Fletcher in the "Daily Mail." He had been to London, and returning home to Yorkshire on the vehicle driven by a "chuffer," had an enjoyable trip, the delight of which was alloyed somewhat by the police. "'T'chuffer let hisself get a bit elated, or else I did, wi' th' pleasure o' flyin' thro' the air, and theer wor some police cam' on t' scene, and thou Mrs. Poskitt mustn't be surprised if I get a summons in th' morning for travelling above t' limit speed. It'll be £5 and costs (and happen £10)," said Mr. Poskitt, ruefully.

The car was stabled "at the Red Lion at Sicaster," and the sturdy Yorkshireman thus explained to his spouse how he became a motorist. "We shall have to start what they term a gayrage out in t' garden theer, to keep it in. And as to why I bowt it—it were i' this way. Thou sees, owd love, when I were i' London just afor Christmas I went down to a motor-car exhibition at that theer Olympia place, and I were sore tempted to buy summat o' t' sort at that time—but I refrained. Varry well—now then, this time theer wor a Motor-Car Show at t' Agricultural Hall—where all t' prize cattle comes from, or

## CONTINENTAL NOTES.

## The Circuit European.

A meeting of motor spirit dealers was held in Paris last week, when it was agreed to establish temporary supply depots at the entrance to all the leading towns in France passed through by the competitors in the Circuit European. Here a large stock of essence will be kept, which will be supplied at a uniform rate of 4d. per litre.

## Public Services in Germany.

Negotiations are in hand with regard to the establishment of a public motor-car service between Posen and Dembsen. Arrangements are also being made for the formation of a new company to organise a service of motor-omnibuses between Berlin and the suburbs of Treptow, Tegel, the Grunewald, etc. The municipal authorities of Durg are interested in a scheme to give communication between that town and Welster by a motor-omnibus service. The municipal authorities of Kiel are considering the question of introducing motor-'buses' in the town.

## La Coupe Provinciale.

A reliability contest for the Coupe Provinciale is to be held

A View of Mount Pellegrino, Palermo, Sicily, where the Motor-boat Race, known as the Pearl of the Mediterranean, is to start on the 17th inst.

rather, where they go to, poor things, and I thowt I'd just go up and see it. An' so I went—and I fell a victim to t' persuasions of what they call the Modern Sperrit. It didn't cost no more nor what I've paid for a reight, first-class, well-bred horse and a smart dog-cart."

"How much did it cost, Martin?" inquired Mrs. Poskitt. "And what use is it going to be?"

"Well, thou sees, owd love, it were just here," replied Mr. Poskitt. "Ye see—I got up theer to t' Show. An' theer were Lord Castletop, our member o' t' Parlyment—Lord Norman-caster's son, as ye know. He catches sight o' me. 'Now then, Poskitt,' he says, getting ho'd o' my arm, 'come an' buy a nice little run-about to carry you and the missis round the country when you want to give the mare a rest.' 'And who's going to drive it, my lord?' says I. 'Why,' says his lordship, 'they'll lend you a chap that'll teach you how to drive th' whole thing in a day or two, and then you and Mrs. Poskitt will be able to career all over the countryside, and be as happy as sand-boys. A man like you, Poskitt,' says his lordship, 'a man that made money in the good old days, when one could get a decentish price for a quarter of real English-grown wheat, ought to patronise modern industries.' An—I didn't say owt—but I rade home in it."

on June 17th next. It is being organised by the Federation of Automobile Clubs in South-eastern France, and will be held on a circuit near Marseilles, which, starting at Baraque Fuveau, takes in Chateauf-neuf-le-Rouge, Peynier, and La Pailladon, this having to be covered three times. The contest will be open to light and heavy cars, and also motor-cycles, the event including a speed trial on a level kilometre and a hill climbing contest over a similar distance on the Jaliot Hill.

## A Competition for Motor Street Sweeping Machines.

In connection with the forthcoming International Exhibition in Milan a competition of motor machines for street sweeping and cleaning purposes is being organised. The vehicles must have a capacity of not less than 35 cubic feet, and be suitable for all road surfaces, and have an effective speed of 6½ miles per hour on gradients up to 1 in 33. The contest is confined to manufacturers, whose machines must be presented not later than July 31st, and be at the disposal of the committee up to December 15th. First and second prizes of respectively £160 and £80 are being offered in connection with the event.

## The Italian Coppa d'Oro.

No less than fifty-one cars have been entered for the great touring competition known as the Coppa d'Oro, which is to be

held by the Automobile Club of Milan, from the 15th to the 25th May. Italy will be represented by three Fiats, five Franchinis, 5 Diatto-Clements, three Zusts, one Bianchi, three Italas, two Florentias, five Rapids, an S.A.L. and three Marchands; France by three De Dions, an Aries and a Krieger; England by three Napiers, two Argylls and a Daimler; Germany by three Benz; Switzerland by three Martinis, and America by two Oldsmobiles and a White steamer.

#### A Voiturette Competition in Italy.

A touring competition for voiturettes was held in Italy last week. The course was from Milan to San Remo, a total distance of 310 kilometres, divided into two daily stages of respectively 136 and 174 kilometres. The competitors were divided into two classes: (1) cars the chassis of which cost under £160; and (2) cars the chassis of which cost between £160 and £320. Twenty entries had been received, but of these only eleven started, nine of which completed the whole distance. In Class 1 the order was (1) Maffei on a Maffei, total time 10 hr. 32 min.; (2) Orsi on an O.T.A.V., 12 hr. 2 min.; and (3) Longoni on a De Dion, 12 hr. 35 min. Class 2: (1) Tamagni, on a Marchand, 9 hr. 16 min.; (2) Gagliardi, on a Diatto-Clement, 9 hr. 17 min.; (3) Ferrari (Ford), 9 hr. 47 min.; (4) Alby (Taurina), 9 hr. 54 min.; (5) Canfari (Taurina),

rounds. In the afternoon a 50 kilometre contest for 26 ft. racers was held. Out of six entries only four started, and of these two broke down. The event was won by Antoinette IV., Levavasseur motor, time 1 h. 5 min. 23 sec. Rapière II., with Panhard engine, was second in 1 h. 11 min. 55 1-5 sec. On Monday the first race was for cruisers between 21 ft. and 26 ft., with engines up to 3½ litres cylinder capacity. Eight boats started, but only two completed the course, the winner being Excelsior VIII., built by Celle, with a Picker-Mocand motor, the time for the 50 kilometres being 2 h. 19 min. 36 sec. Janus II., with Janus engine, was second. In the afternoon a 50-kilometre contest, for racers up to 40 ft., caused some excitement. Only three boats started, Yarrow-Napier getting away first, followed by Martini III. Mr. Lionel de Rothschild's Siola could not start her engines, and only got away just as Yarrow-Napier had completed the first round of the course. During the second round of the vessel a mechanic was washed overboard, and ten minutes were lost in picking him up. The race was won by the Yarrow-Napier in 2 h. 0 min. 41 sec.

#### Miscellaneous Notes.

The Berlin German Omnibus Company is reported to have placed an order for no less than 150 German Daimler buses for delivery by the end of June, 1907.—The German Daimler

The Village of La Ferte-Bernard.

10 hr. 18 min.; and (6) Salvioni (Rapid), 10 hr. 49 min. The cup offered by Count Biscarette was awarded to Raggio.

#### The Dutch Reliability Trial.

The Dutch Automobile Club is organising a reliability contest to be held from 21st to the 25th May next. On the first day the run is from Nymegen to Luxembourg via Aix-la-Chapelle, 335 kilometres; on May 22nd from Luxembourg to Baden Baden, 340 kilometres; May 22rd will be devoted to an exhibition, the trial re-commencing on the 24th by a run to Frankfort-am-Main, 315 kilometres. The trial will be brought to a close on May 25th, the day's journey being from Frankfort to Arnheim, 350 kilometres.

#### Motor-Boat Racing at Monaco.

The annual motor-boat race meeting at Monaco commenced on Sunday last. Of the eighty-eight entries which had been received for the various events, fifty-six boats put in an appearance during last week. The first race was one of 50 kilometres for cruisers under 21 ft., and with engines having a maximum cylinder capacity of 2½ litres. There were sixteen starters, but a number quickly fell behind. The winner proved to be the Mendelsohn, with Mutel engine, its time for the 50 kilometres, being 2 h. 1 min. 3 1-5 sec. Mr. Miall Green's Takumono, the only British representative, was second in 2 h. 28 min. 6 3-5 sec. The performance of this boat, which is fitted with a Blake engine, was noteworthy, in that during the run five times round the course there was not 15 sec. difference between any two

Company is stated to be interested in a new company which is in course of formation in Vienna to manufacture the Lohner-Porsche combination petrol electric cars on a large scale.—A motor-bus service is shortly to be started between Roubaix and Watrelos, and between Herseaux and Watrelos.—M. Megevet, of Geneva, has presented a cup to the Swiss Automobile Club as the prize for a touring competition to be held during the coming summer.—The Spanish War Department has recently acquired a German Daimler 18-h.p. motor-wagon.—King Alphonso of Spain is reported to have placed an order for a 24-h.p. car with the Sociedad Hispano-Suiza, of Barcelona, the only motor-car building firm in the country.—A motor-car exhibition was opened in Budapest on the 4th inst.—Prince Henry of Prussia has entered his 60-h.p. Benz car for the Herkomer Touring Trophy contest, and will probably drive the vehicle himself.

THE foundation stone of a new clubhouse for the Automobile Club of America in Fifty-fourth Street, New York, was laid on the 21st ult. in the presence of a large number of the members. The building will have a frontage of 131 ft. and will be eight stories high. The ground floor, reached by a large entrance and a separate exit for cars, will serve as an immense garage in which many cars can assemble. The top floor, made exceptionally light by skylights, will be fitted up as a model repair shop, and will contain the Club dynamometer, designed for measuring the power and the efficiency of cars under all conditions.

## SOME CURRENT TOPICS.

### The Time for Overhauling.

Like nearly all mortals, motorists are prone to procrastinate—to put off until some other day the work that should be done to-day. Spring is now with us, and, if not already done, the work of overhauling and putting in running order one's car ready for the coming season should be put in hand without delay. Such work will have to be done, and it is simply a question of having it done now, when repairers have plenty of

### The B.A.C.S. Motor 'Bus.

A new addition to the list of firms catering for the heavy demand for motor-buses is the British Automobile Commercial Syndicate, at whose depot on Monday last we had an opportunity of inspecting the first of the new chassis. The vehicle, which is being built in France to special design, appears to be of very strong construction. The frame is built up of pressed steel, with a sub-frame of channel steel on which the engine and gear-box are supported. The motive power is supplied by an Aster 30-h.p. four-cylinder engine. The cylinders are cast separately, a feature being the arrangement of the pipes to ensure a good water circulation. The lubrication is effected by a pump, with pressure feed. Two forms of high-tension ignition, magneto and coil and batteries, are provided, these being controlled by separate levers. The speed of the engine is

Major-General Sir Henry and Lady Colville on their 20-h.p. Winton Car.

time, or of rushing it through a few weeks hence, when pleasant, sunny days tempt the motorist forth, and every shop is crowded with urgent work. There are many motorists who will say that their cars do not require overhauling; that they are as ready to run now as they were last year. This is true in a measure, but they would give vastly better service if they were gone over by competent hands and put in the pink of condition. This is especially essential with cars that have been laid up for the winter. All machinery is the worse for disuse. Dust and dirt penetrate to the working parts, however great the efforts to exclude them, and should be carefully removed. No machinery will run long without requiring some adjustment, no matter how slight, and the parts which have been cleaned, lubricated and adjusted will perform their allotted functions in a manner infinitely superior to machinery which has been left to itself, even although the latter has nothing radically wrong with it.

regulated by a lever above the steering wheel, the clutch pedal being also so coupled up to the throttle valve that as the clutch, which is of the leather-faced cone type, is withdrawn, the speed of the engine is cut down. The gear-box, which is adapted to give three speeds forward and a reverse, is located well forward and is connected with the differential shaft by a universally-jointed shaft, on both ends of which large contracting brakes operated by one pedal are mounted. The final drive is by side chains to the rear road wheels, the hubs of which are fitted with hand-controlled compensated brakes. The latter are so arranged that the bands can be readily removed and renewed without disturbing any other part. The change-speed pinions are unusually wide, while the axles are also of liberal dimensions, the object of the designers having been to provide a chassis of great strength, so as to withstand the heavy shocks to which motor-buses are subjected.

A MOTOR garage is being erected at 6, Church Street, St. Helens, by Mr. J. Stewart.

THE Syndicat d'Initiative de Valence-sur-Rhone et de la Drome, of Valence, has sent us a copy of an illustrated guide to this interesting part of France. A copy will, we understand, be sent to any motorist contemplating a tour in the district.

AMONG the recent applications for membership of the Federation of American Motor-Cyclists is one from a rider in Esterhazy, Saskatchewan.

THE new catalogue of "Castle" accumulators, commutators, coils, and other motor accessories, just issued by the United Motor Industries, Ltd., is a comprehensive trade list which has reached the eighth year of publication.

THE Jamaica Motor Union has been formed to persuade the Government to relax its present restrictive regulations with regard to motor-cars.

ON the day of the polling in the Eye division of Suffolk Lord Graham and Lady Mary Hamilton covered 130 miles on a motor-car, making calls at fifty-six villages and hamlets.

THE Coventry depot of the United Motor Industries, Ltd., has trebled the capacity of its recharging facilities within the last few months to cope with the development of business in that department.

MESSRS. PRIDEAUX AND SONS, coachbuilders, of Bear Street, Barnstaple, have opened a motor branch of their business. They have a competent staff of repairers, and garage accommodation for a score of cars.

MR. J. O. HUNT, jun., of Addlestone, Surrey, has in the past six months covered 3,184 miles on his Argyll car, a fairly long distance for the winter season. The vehicle has taken Guildford High Street on the top gear with a load of four passengers, three of them weighing over 13 stone each.

THE "Roberts" detachable non-skid tyre protector deserves attention, having a renewable tread, and being capable of instantaneous adjustment. Full play is permitted to the walls of the cover, so that the natural resiliency is retained. The new tread can be fixed on the body of the band when worn, thus returning the non-skid to its original degree of utility. The Roberts Non-Skid Band Company make and vulcanise their device on to old tyres of any make, and have ample facilities for assisting motorists in difficulties with the tyre problem.

THE London Motor Tyre Company, of 151, Oxford Street, London, W., have, owing to the great increase in their business, taken larger premises in Newman Yard, Newman Street, W., where they are prepared to undertake vulcanized motor tyre repairs of every description. This firm make a speciality of motor tyre work. The offices of the company in Oxford Street, W. will be continued.

## HERE AND THERE.

covers and tubes. One department of the concern is devoted to the repair of motor tyres.

THE attention of the Commissioner of Police is to be drawn by the Holborn Borough Council to the noise made by motor-omnibuses and wagons in Southampton Row, London, W.C.

THE registrations of the Mercedes Daimler Company, the Vivinus Company, a Gearless Motor Omnibus Company, and several other interesting ventures are referred to on a later page under the heading of New Companies Registered.

THE capital of Messrs Straker and MacConnel (1906), Ltd., is £250,000. Agencies for Italian cars will constitute an important factor in the firm's business.

MESSRS. TURTLE have removed to 72, High Street, Croydon, where they have put down more plant and machinery to cope with their increasing business in motor-car repair work.

IN connection with the establishment of a motor mail service between Bandarawela and Lunugala, in Ceylon, it has been decided to import the parts and assemble the first car in the railway workshops there.

A COPY of the E.I.C. 1906 catalogue has reached us from Messrs. Brown Bros., Ltd. This is a very handy list, with complete descriptions and prices of all E.I.C. ignitivities. We notice this list contains particulars of the new E.I.C. solid accumulator as well as complete information respecting the E.I.C. generative system.

THE Car and General Insurance Corporation, Ltd., has introduced some new features of excellence into its comprehensive policies. More liberal terms are now given in connection with accidental damage, and lamps are covered without extra premium.

The makers' statement as to horse-power is accepted by the corporation, and when a range of two horse-powers is given, the premium is calculated on the lower—thus, on a car stated to be of 24-36-h.p., the premium charged is that for 24-h.p.

THE Automobile Club of America is offering a gold cup as the prize for a Two Gallon Efficiency and Distance Test, to be held next month. As is implied by its title, the test will be a competition to ascertain the amount of work a car is capable of doing with this amount of fuel, and to give makers an opportunity to prove the efficiency of their vehicles. In order that all the competing machines shall run on an equal basis a system of awards is being devised whereby points will be allowed for weight, cylinder displacement, distance travelled, percentage of efficiency shown, and such other factors that may have a direct bearing on the result.

Touring in Germany.—A Cudell Car in front of the Cathedral of Charlemagne, Aix-la-Chapelle.

THE first Austin car made its appearance on the road on Saturday last.

WE reserve a review of the new edition of the Motor Year Book to our next issue.

A NEW depot has been opened at 4, Bute Street, South Kensington, by Messrs. A. Haswell and Co.

A CAR belonging to the South Wales Motor Company was used in connection with the A.C.G.B.I. examination at Cardiff.

WITH offices at 34, Norfolk Street, Strand, the Spring Wheel Company, Ltd., has been registered. Its capital is £1,000.

THE Palmer Air-tube Protector, shown in the accompanying illustration, will be a boon to the motorist who does not always carry a spare tyre. In case of the cover being badly punctured or cut, this protector is slipped over the spare or repaired tube immediately under the cut, and, being made of strong "Palmer Cord" fabric, it withstands

the usual riding pressure without any tendency to bulge. Thus protected, the tyre can be run for 200 to 300 miles if necessary before the cover is removed for repair. The protectors cover the air-tube for a length of about 12 inches. There is no need to solution the protectors in position, the air-pressure within the tyres holds them effectually; and, consequently, the same protector can be used as often as necessary.

So far seventeen cars have been entered for the American elimination trial for the 1906 Vanderbilt Cup race. It is reported in New York that a 100-h.p. English Daimler car is being built for the contest.

LORD DUNRAVEN has just ordered a 40-h.p. Crossley car from Messrs. Jarrott and Letts, Ltd. The vehicle will be fitted with a handsome touring Roi des Belges carriage body by Messrs. Thrupp and Maberley.

MR. F. D. UNDERHILL, the president of the Erie Railroad Company, who is now in California, has had his 45-50-h.p. Pope-Toledo touring car fitted with flanged wheels to run on rails. He intends to make the trip from Los Angeles to New York along the railway track.

THE Non-Exploding Casks Vessels Company are making casks and vessels which are guaranteed safe from all risk of explosion, and eminently suited for use by automobilists. One of the company's specialties is a motor canister for petrol, which can be had in any shape or size.

MESSRS. B. BARLING AND SONS, of Park Street, Camden Town, N.W., have brought out a motorist's pipe of undoubted convenience. To all who enjoy a pipe, and who have previously found it a source of trouble on the car, Messrs. Barling's excellent device comes as "a boon and a blessing."

MR. W. HARVEY HILLIARY, of Stockwell, S.W., has written to Messrs. R. Reynold Jackson and Co. that he has added up the distance done by the 9-h.p. Jackson dogcart he bought in June last year, and finds that up to the 7th ult. it had covered 14,230 miles. His best run in one day was 130 miles, and the average consumption of petrol works out at twenty-six miles per gallon.

JOHN MURPHY, a motor-car driver, has been indicted at the Middlesex Sessions for breaking and entering a warehouse at Salusbury Road, Kilburn, and stealing a motor-car and accessories to the value of £254 18s., the property of Richard S. Currie. Prisoner was in the act of getting away with the car when the police received information and surrounded the warehouse. The police found identification plates which he had made from black boards, the letters being of white paper, which could have been easily removed and altered. A sentence of nine months' imprisonment was passed.

THERE are at least five motor-bicycles in use in Central Africa.

A PRIMITIVE Methodist chapel at Long Sutton (Lincs.) is being converted into a motor garage.

THE Ridley Motor Company has been registered with a capital of £5,000 and offices at George Place, Paisley.

THE capital of the Mills Motor and Marine Engineering Company, Ltd., just registered, is £5,000.

NEXT year the Irish Automobile Club will participate in the welcome to the annual Conference of the Institute of Journalists in Dublin.

THE London General Omnibus Company have secured a licence to store 6,000 gallons of petrol at their garage at Dollis Hill, Willesden.

At the Royal Dublin Society's Show, Argylls, Ireland, are exhibiting three cars of 10-12, 14-16, and 16-20 h.p. respectively. They will also show the 14-16-h.p. chassis.

MR. A. J. ALLGOOD, of the Cinque Ports Cycle and Motor Works, High Street, Sandwich, has opened a new motor garage, and is stocking a large quantity of spare parts.

THE motor-car A.1 is very well known, according to a witness in a police court recently, on the Ripley road. This is an 18-h.p. White steam car, the property of Earl Russell.

THE value of the motor-cars and parts exported from the United States during February last is returned at £66,542, as compared with only £56,026 in the corresponding month of 1905.

MR. W. BALLIN HINDE has just returned from a long tour through Europe, covering a distance of between seven and eight thousand miles, on a 22-28-h.p. Crossley car. In conversation he mentioned that some of the roads over which he had travelled were of the vilest and most impossible description, but that the car stood up splendidly right through. In his wanderings he went through France, Italy, Austria, Croatia, Dalmatia, Herzegovina, and Switzerland.

WE illustrate herewith a collapsible trestle which has recently been introduced by Mr. R. Raitt, of the Strathmore Motor Works, Blairgowrie, N.B. It is intended for use in

motor repair shops and private garages to facilitate the removal of engines and other parts of the mechanism of motor-cars from the chassis. The trestle, which is fitted with lifting tackle, is made to collapse in a very small space, as shown in the lower illustration. It can thus be stowed away under a bench, and when required can, it is claimed, be erected in two minutes, no loose bolts or nuts being employed. Two sizes of the trestle are being made, one to lift 5 cwt. and the other up to 10 cwt.

# The Cordingley Show.

[Continued from page 129.]

A View of the Aero Section of the Exhibition.

## The Prima-Monde and Bolide Cars.

A four-cylinder car which attracted considerable attention on account of its relatively low price was the Prima-Monde, exhibited by the MONDE MOTOR COMPANY, LTD. The motive power is supplied by a 12-h.p. engine comprising four cylinders 80 mm. bore by 90 mm. stroke. The valves are mechanically actuated off a single cam shaft, and the ignition is by coil and accumulators to a special form of contact maker working in oil. The feature of the chassis is that the clutch and change-speed gear is contained in a casing forming an extension of the base chamber of the engine. The transmission is by cardan shaft and bevel gear to a well-supported live axle, and there are three forward speeds and reverse, with direct drive on the top speed. Any type of carriage body can be fitted to the chassis, ranging from a two-seater to a landaulet. The Monde Company also exhibited a 16-h.p. Bolide chassis; this follows the usual lines of live-axle cars. The four-cylinder engine, 90 mm. bore by 120 mm. stroke, is fitted with high-tension magneto and a special form of automatic carburettor. The lubrication of the engine is maintained by a pump, which forces the oil from a tank fixed in front of the engine through sight feeds on the dashboard.

## The Herald Cars.

Three sizes of Herald cars, 10-12-h.p., 16-24-h.p. and 30-40-h.p., were shown by the HERALD MOTOR COMPANY. The 10-12-h.p. vehicle, which is fitted with a cab or landaulet body, represents the type supplied to the Metropolitan Motor Carriage Company; the motive power is supplied by a two-cylinder engine having mechanically-operated valves and both magneto and accumulator ignition. The transmission is through a gear-box giving three speeds and a reverse and side chains. Passing now to the 16-24-h.p. and 30-40-h.p. cars (Fig. 70), except that in the former the four-cylinder engine has only one cam shaft and in the latter the valves are located on opposite sides, the following particulars may be taken as applying to both. Both magneto and accumulator high tension ignition are provided, while the engine lubrication is maintained by a pump. The carburettor, which is pressure fed, is of the automatic variety and is provided with a hot water jacket. The clutch is connected by a cardan shaft with the change-speed gear-box; the latter has two sliding sleeves and "gate" control, four speeds and a reverse being provided. The final drive is by side chains. Ball bearings are used throughout except in the engine. Double elliptical springs are provided at the rear, these being supported from a bar extending across

the pressed steel frame. Altogether the modern Herald cars are excellent specimens of automobile engineering.

## The Milano Car.

Another of the new Italian cars at the Show was seen in the Milano, a vehicle which is built by the Societa Milanese Industrie Meccaniche, and is being introduced into this country by MILANO MOTORS, LTD. The chassis shown was of 22-28-h.p., the four-cylinders, which are cast in pairs, measuring 180 mm. bore by 125 mm. stroke. The ignition is by high-tension magneto; the valves are on opposite sides of the motor and operated off separate cam shafts. The radiator is circular in form and is of a special design, the tubes being extremely flat, so that if any leakage occurs the tube in which it is taking place has merely to be squeezed together, instead of being soldered, the circulation generally not being interfered with. Another novelty is a turbine fan, which is cast on the periphery of the flywheel. The clutch, which is of the leather-faced cone type, is connected with the gear-box by a universally-jointed shaft. The change-speed gear gives four forward speeds and reverse, with direct drive on the top speed, the transmission being by a countershaft and bevel gear to a live axle. Ball bearings are used in the gear-box and axles and also on the half-time shaft of the motor itself. The lubrication, water circulation, and petrol supply are all under pressure. The springs are of special design, the top leaf of the same gradually thickening towards the ends, where they turn up to increase the strength of the dumb-irons. A special feature of the car is found in an arrangement by which the steering column can be set at any angle to suit the requirements of the individual drivers. The end of the column lies in a cradle and runs between two slides, the driver being able to lock it in the position which suits him best.

## Springs.

Messrs. HERBERT TERRY and SONS had a large selection of springs of every description for all purposes such as are required by the motorist. A set of springs to suit any special motor can be supplied in a box, so that the user has a handy selection of assorted inlet, exhaust and other springs ready to hand. The display also included an assortment of steel motor springs designed to stand heat and strain without injury, a spring belt for driving motor fans, pumps, etc., an interesting collection of springs, clips, and wire-work of all descriptions for use in connection with the automobile industry.

**The Mass Cars.**

The exhibit of the LANCASTER MOTOR GARAGE was of a unique character, inasmuch as no less than seven models of the Mass cars, ranging from a single-cylinder to a 28-32-h.p. four-cylinder, were on view. The 8-h.p. is fitted with a De Dion engine and three speeds and a reverse, with direct drive on top speed. The power is transmitted to the rear axle through a cardan shaft and bevel gear. The details throughout are very complete, the little car, which can be supplied without a detachable tonneau body, having all the features of more powerful touring vehicles. The 10-12-h.p. chassis, which has a sufficiently long wheel base to receive side-entrance bodies, has a four-cylinder engine, 85 mm. bore

expanding type, and has special holes cut in the drum to allow any oil to escape. The lubrication is by a gear-driven pump to drip feeds on the dash. The whole of the working parts are very accessible, the clutch in particular being so arranged that it can easily be dismantled. Some very luxuriously-finished complete vehicles were included in the exhibit, one of which, a 28-32-h.p. limousine, painted yellow with black and red lines, was among the most admired cars in the show.

**The Hallamshire Cars.**

Messrs. DURHAM, CHURCHILL AND COMPANY exhibited two sizes of their Hallamshire cars of respectively 12-14-h.p. and 24-30-h.p. Both are fitted with Aster engines of the latest type. The clutch is

Fig. 70.—Elevation of Chassis of Herald 30-40-h.p. Car. (See page 147.)

by 100 mm. stroke. The valves are all mechanically actuated off a single cam shaft. The drive is through a three-speed gear-box and a cardan shaft and bevel gear to the live axle, the latter being well supported by a special torsion rod. Ball bearings are fitted to all the bearings except those of the engine. The 14-h.p. car is on similar lines to the 10-12-h.p. The clutch is, however, of the Hele-Shaw disc type. The 16-20-h.p. car (Fig. 71) is of the chain driven variety, a feature being the great strength of the axles. Universal joints are introduced on the shaft between the clutch and the gear-box and between the latter and the differential shaft, which has been placed well to the rear in order to admit of a short chain drive. The 28-32-h.p. is an entirely new model. The motor comprises four-cylinders, 115 mm. by 135 mm. The carburettor is of the Mercedes type, with plunger control, and an extra air inlet, closed from the dash when starting. The ignition is by low-tension magneto. The moving member of the ignition forms the fulcrum of a lever, at one end of which is fixed a spring, keeping the ignition points together. The other end fits

of the Champion metal-to-metal type, and three forward speeds and a reverse, with direct drive on top speed, are available, the power being transmitted through a cardan shaft and bevel gear to a live axle. The latter has only the driving effort to withstand, the weight of the car being taken by the sleeve, the power being transmitted to the road wheels through dog clutches in the hubs. The motor is controlled by levers on the top of the steering wheel, the sector being, however, so arranged that it does not move with the steering wheel, and is therefore always conveniently located. The bodies, which are of a roomy side-entrance double phaeton type, are built by Messrs. Durham, Churchill, and Co. in their own works.

**The Beaufort Cars and Vans.**

A handsome specimen of the well-known Beaufort cars was exhibited by the CENTURY MOTOR COMPANY, of Willesden Junction. It was of the 18-22-h.p. chain-driven type and fitted with a Princess-side-entrance double phaeton body, painted green. The engine

Fig. 71.—Chassis of Mass 16-20-h.p. Car.

into an adjustable spanner head, screwed on the tappet rod, and capable of the minutest adjustment by means of a milled nut. On the fly-wheel are marks for the correct setting of the ignition. The positive wires are brought to a bridge, and fixed by spring plugs. The fly-wheel has blades formed in it to act as a fan, and the power is taken through a leather-faced cone clutch by a short universally jointed shaft to the gear-box, which gives three speeds and reverse by the usual sliding pinions. A short cardan shaft connects the gear-box with the differential shaft, from which the power is transmitted by side chains. The pedal-operated brake, placed behind the gear-box, is of the internal-

comprises four cylinders 95 mm. bore by 115 mm. stroke, with the mechanically-operated valves arranged on opposite sides. A feature of the motor is the variable lift of the inlet valves, the lever controlling which is so interconnected with the ignition that when the valve is opened slightly the time of firing is retarded. The ignition is by low-tension magneto, and a special form of automatic carburettor furnishes the mixture. The male member of the clutch, which is of the leather-faced cone type, is held up to its work by three springs so arranged that no end thrust is exerted either on the crank or gear shaft. Three speeds forward and a reverse are provided. A service-

able looking Beaufort delivery van was also on view; it is designed for loads up to 30 cwt., the motive power being supplied by a 18-h.p. two-cylinder engine. The transmission is by side chains, and the rear wheels are shod with solid rubber tyres.

#### Convertible Bodies.

The display of the AUTOCARS AND ACCESSORIES, LTD., of West Norwood, was one of considerable interest to tradesmen, as they were showing a little car the feature of which is the provision of two bodies, either of which can be mounted on the chassis in a very short time. One is a van designed for loads from 2 to 3 cwt. and the other a neat body for two persons. Thus the vehicle can be used during the week for delivery purposes, and, when desired, for pleasure purposes. We give

Fig. 72.—The 6-h.p. Rover as a Delivery Van.

herewith illustrations (Figs. 72 and 73) of a Rover 6-h.p. car provided with the alternative bodies. Other types of cars can be equipped in a similar way, the idea being one which should prove acceptable to a large number of prospective motorists.

#### The S.P.Q.R. Cars.

A new series of British-built cars was shown by ELSWICK MOTORS, LTD., which attracted considerable notice on the part of the visitors. They are known as the "S.P.Q.R.," the name being derived from the four words—speed, power, quietness, and reliability—four qualities which the vehicles are claimed to possess in the highest degree. We first inspected the chassis of the 15-20-h.p. car. This has a pressed steel frame narrowed at the forward end to increase the lock of the steering wheels. The engine comprises four separate cylinders  $3\frac{1}{2}$  in. bore by  $3\frac{1}{2}$  in. stroke. The valves are all operated off one cam shaft the inlets being located in the cylinder heads. The water circulation

which does not carry the weight of the car, the road wheels being mounted on the axle casing and receiving the power through dog clutches in the hubs. The foot brake acts on a drum at the rear of the gear-box, while a hand lever controls internal expanding copper-lined brakes on the back wheels. Passing now to the 26-30-h.p. car (Fig. 74) this is, generally speaking, on similar lines to the 15-h.p. The four cylinders of the engine are, however, cast in two pairs, the dimensions being  $3\frac{1}{2}$  in. bore by 4 in. stroke. A novel feature is found in the fact that the petrol tank, which is of a curved pattern, is so arranged as to form the dashboard. The arrangement of the brake control is also the reverse of that usually adopted, the pedal actuating the rear hub brakes and the side lever a contracting brake behind the gear-box

Fig. 73.—The 6-h.p. Rover as a Two-seater Car.

the latter being also connected up to the clutch. The pressure of oil and water circulation are indicated by two pressure gauges on the dashboard, which is otherwise quite clear of the usual array of lubricators, etc.

#### The Horbick Car.

Two excellent examples of the Horbick 12-16-h.p. four-cylinder cars, one fitted with a side-entrance double phaeton body and the other as a landaulet, were shown by the HOLLAND PARK MOTOR COMPANY. The vehicles have armoured wood frames, in the fore part of which is set an engine comprising four separate cylinders. The inlet and exhaust valves are interchangeable and mechanically actuated off separate cam shafts. The mixture is furnished by an automatic carburettor, and the ignition is by coil and accumulators. The power is conveyed through a cone clutch to a gear-box, giving three speeds forward and a reverse, with a direct drive on top speed through a telescopic cardan shaft and

Fig. 74.—Chassis of "S.P.Q.R." 26-30-h.p. Car.

is maintained by a gear-driven pump and a honeycomb radiator set in a circular shaped frame forming the tank. Behind the latter is an air-inducing fan driven by a chain and free wheel clutches, so that the fan can overrun the gear if occasion arise. The engine is controlled by special self-locking levers mounted over, but not fixed to, the steering wheel. An automatic governor is also provided. Ignition is by high-tension magneto. The exhaust gases are carried away by four large-sized pipes running direct from the valve pockets to the main silencer pipe below the engine, from whence the gases pass to the silencer proper, placed transversely at the rear of the chassis. The power is transmitted through a large leather-faced cone clutch and a universally-jointed shaft to a gear-box giving three speeds and a reverse. The change-speed gear shafts are of unusually large diameter, while the clutch spring can be readily adjusted by means of a milled-edge collar, which has a ratchet locking arrangement. The final drive is by a cardan shaft and bevel gear to a live axle

bevel gear to the rear live axle. The brakes are of the metal-to-metal type, the foot brake contracting on a drum on the differential, and those applied by a hand lever expanding inside drums connected with the hubs of the rear road wheels. The throttle and ignition levers are mounted on the steering wheel in such a way that they do not move with the wheel, and are consequently always close to the driver's hands. A foot accelerator is also provided. The Horbick cars enjoy a high reputation in the north, and now that a London agency has been established they will, no doubt, quickly become equally as popular in the South. The Holland Park Company, also exhibited a 24-h.p. chain-driven Argus car fitted with double phaeton body.

#### Cars for Hire.

AUTOMOBILES DE LUXE, LTD., which make a speciality of hiring out motor-cars, had on view a number of the Darracq vehicles they keep on hand for this purpose, these including a 30-h.p. limousine and a 12-16-h.p. side entrance double phaeton.

**The Fairfax Car.**

A car which departed somewhat from the usual lines was the Fairfax (Fig. 75) exhibited by Messrs. J. S. FAIRFAX AND CO., of Chiswick. The engine is set somewhat low in the front end of a pressed steel frame in such a way that it lies under the driver's footboard; this, together with the steering pillar, having but a moderate rake, enables a roomy side-entrance body to be fitted on a frame of moderate length. The engine, which is of 7.9-h.p., comprises two vertical cylinder 3 5/32 in. bore by 3 9/16 in. stroke, with the mechanically

Fig. 75.—The Fairfax 7.9-h.p. Car.

operated valves arranged on opposite sides. The water-cooling is on the thermo-siphon system, no pump being used. The usual ignition by coil and accumulators is provided, and the mixture is furnished by a Longuemare automatic carburettor. From the motor the power passes through a leather-faced cone clutch to a special gear-box giving three speeds forward and a reverse with direct drive on top. The change-speed gear is of a special form, the various pinions being always in mesh and operated by a single lever. The final drive is by a cardan shaft and bevel gear to a live axle. The car, which has a wheel base of 6 ft. 9 in., is well sprung, which enables solid rubber tyres to be fitted to the road wheels.

**The West Cars.**

Among the new exhibitors at the show were Messrs. WEST, LTD., who had on view a 20-22-h.p. chassis which comprises a number of interesting features. The frame is of pressed steel construction

Fig. 76.—The West 16-20-h.p. Double Phaeton.

narrowed in front to increase the lock of the steering wheels. The motive power is supplied by one of the latest types of Aster four-cylinder engines having separate cylinders and the valves arranged on opposite sides. Dual ignition is fitted, both high-tension, while the mixture is furnished by a Longuemare automatic carburettor. The clutch is of novel design; it is of the disc variety, and designed to run in oil. The discs are of phosphor bronze, with a steel annulus between them, and the three are pressed against the flywheel by the clutch spring. The change-speed gear gives three forward speeds and reverse

with the secondary shaft entirely out of operation on the top speed. A cardan shaft and bevel gear transmit the power to the rear live axle. The latter is provided with ball thrust bearings in the centre, and the load is carried on long roller bearings, one on each side of the differential. The road wheels, which run on extensions of the axle sleeve, are on long plain bearings with hardened steel bushes. Special provision is made for the lubrication of the universal joints. A neat system of engine control is fitted on the centre of the steering wheel, not unlike the Panhard in appearance, the connection between the controlling thumb rollers and the throttle and ignition being effected by Bowden wires, which pass down the centre of the steering column. Messrs. West also exhibited a 16-20-h.p. side entrance double phaeton (Fig. 76) and a car of equal power fitted with a luxurious demi-limousine body by Meier, of Redhill. The mechanical details of both of these vehicles are, with a few exceptions, similar to those of the 20-22-h.p. model referred to above.

**The Benz Cars.**

Messrs. BENZ AND CO., one of the oldest builders of motor-cars in the world, are now turning out a large number of powerful touring cars, which in design and construction are of a notably high order. The British agency for these vehicles has recently been acquired by the Cannstatt Automobile Association, who had on view three cars which attracted considerable attention. We first inspected the chassis of the 28-h.p. car; this has the standard pressed steel frame, fixed in the fore part of which is a four-cylinder engine. The cylinders, which are cast in pairs, are 105 mm. bore by 130 mm. stroke, and the valves are arranged on opposite sides, being actuated off separate cam shafts. The water circulation is maintained by a pump and a large radiator. The latter, although very similar to the honeycomb type, is of the flat tube variety; a fan is provided to induce a current of air, the belt being kept at the requisite tension by mounting the

Fig. 77.—The Benz 28-h.p. Landulet.

pulley on a swinging spindle which is kept up to its place by a spring. The mixture is furnished by an automatic carburettor, a lever being provided by means of which the supply of petrol can be regulated and the float chamber flooded from the dashboard. Dual ignition is provided, low tension magneto and high tension by accumulators. No governor is fitted, the speed of the engine being controlled by hand and foot levers. The clutch is of the leather-faced cone type and the shaft which connects it with the gear-box is provided with a sliding joint. The gear is adapted to give four speeds and a reverse, the final drive being by side chains. Two contracting brakes are mounted on the differential shaft, both being water cooled; the rear brakes, which are of the expanding type, are provided with a simple means of adjustment. Ball bearings of the D.W.F. type are fitted to all the shafts and axles, except on the engine. A 40-h.p. car was also on view; this is similar in general arrangement to the 28-h.p., and was fitted with a handsome limousine body. Finally reference may be made to a 28-h.p. live axle car—both types being made by Messrs. Benz. The vehicle is fitted with a double phaeton body, the rear portion of which is of novel design; the seat is made complete with its own back rest and is arranged so that it can slide forward. Between the back of the movable seat and the extreme portion of the body is a shelf on which small bags can be carried. There is also room under the seat for two large trunks, the vehicle being thus noteworthy for its large luggage carrying capacity.

**The Gnome Car.**

GNOME, LTD., were present with a couple of Gnome cars, which appear to combine simplicity of design with sound construction. The vehicles exhibited were of the 18-24-h.p. and 24-30-h.p. types. Both are provided with pressed steel frames and Gnome four-cylinder engines, the dimensions of the smaller one being 98 mm. bore by 130 stroke and of the 24-30-h.p. 110 mm. by 130 mm. The valves are all mechanically actuated. The transmission is through a leather-faced cone clutch to a gear-box giving respectively three and four forwards speeds in addition to the reverse. Thence the power is conveyed by a cardan shaft and bevel gear to a live axle, squares on the end of the latter driving the rear road wheels. The tension rods to the axle are of unusually liberal dimensions and special attention appears to have been devoted to the brakes. We may add that ball bearings are fitted to all shafts except on the engine.

### The Peugeot Cars.

An interesting display of the Peugeot cars was made by Messrs. FRISWELL, LTD. The principal features of the 1906 models have already been dealt with in the *M.C.J.*, but we may briefly mention that they include 8-h.p. single-cylinder, 10-12-h.p. double-cylinder, and 12-16-h.p., 18-24-h.p., 30-40-h.p., and 50-60-h.p. four-cylinder cars. Compared with last year, the smaller vehicles show little change. In the larger types, however, there are a number of modifications. The motors have the four cylinders cast in two pairs, and all the valves mechanically

used on Peugeot cars. Another improvement in the 1906 models is that ball bearings are used throughout, except in the engine. The complete cars on view included the handsome 30-40-h.p. double phaeton illustrated in Fig. 79 and an 18-24-h.p. limousine. Considerable interest was shown in the new "Baby Friswell" car (Fig. 78), which has been introduced to take the place of the well-known Baby Peugeot. The frame, which is of pressed steel construction, is well sprung, the rear springs being set outside the frame. The motive power is supplied by a 6½-h.p. De Dion engine, carried in a specially designed

Fig. 78.—The New Baby Friswell.

actuated, the inlets being on one side and the exhausts on the other. Low-tension magneto ignition is employed, provision being made for fitting the high-tension system by coil and accumulator as a reserve. Attention may also be drawn to the fact that the magneto, which is gear driven, is so arranged that it may instantly be removed from its place whenever necessary. The clutch is of the leather-faced cone type; the shaft which connects it with the gear-box is so constructed as to compensate itself to any want of alignment between the two parts. The

cradle. The mixture is furnished by a De Dion carburettor. The ignition is by coil and accumulators, and the water circulation is on the thermo-siphon system, no pump being used. The power is transmitted to the gear-box through a leather-faced cone clutch. The gear-box gives three speeds forward and a reverse, the top speed being a direct drive through a cardan shaft and bevel gear to a live axle. A hand lever controls a brake on a drum at the rear of the gear-box; a pedal applies internally-expanding segmental brakes within drums on

Fig. 79.—The Peugeot 30-40-h.p. Side Entrance Double Phaeton with Cape cart hood.

change-speed gear, which is adapted to give four speeds forward and a reverse, is now on Mercedes lines, the lever working in a "gate" quadrant. The gear-box has been separated from the differential shaft, which latter, as will be seen from Fig. 79, has been placed further to the rear to permit of a short chain drive. All the brakes are of the internal expanding metal-to-metal type, that on the cross shaft being enclosed in the differential case. Special attention has been devoted to the question of lubrication of the various bearings, which is automatically effected, it being pointed out to us that there is not a single grease cup

the rear wheels, the usual practice being thus reversed. The ignition and throttle levers are mounted on the steering wheel, and a small pedal between the clutch and brake pedals is provided for temporarily slowing down the engine in traffic. All the shafts and wheels run on ball bearings with the exception of the engine shaft. The petrol and oil tank are formed in one, and placed in front of the dashboard. The wheelbase of the car is 6 ft. 3 in., the wheel gauge 3 ft. 6 in., and the length over all 9 ft. Altogether the little car is one which should be given close inspection by those looking for a reliable little vehicle.

### The "Armada" Tri-cars.

Considerable interest was shown in the exhibit of TOBOGGAN MOTORS, LTD., who were showing several of their "Armada" tri-cars, the feature of which is the friction drive. They are made in two sizes, 5-h.p. single-cylinder and 7-8-h.p. twin-cylinder. The frame is of channel steel; the back wheel is suspended upon semi-elliptical springs. The ends of the rear wheel spindle run in specially-designed guides, which act in the same manner as locomotive horn plates. The transmission is brought about by a leather-faced wheel mounted on a square driving shaft being brought into play against the face of the

Fig. 80.—The Armada Delivery Tri-Car.

outside flywheel of the engine. By moving the leather-faced wheel across the flywheel, in to, or out from, the centre, a complete variation of speed is obtained, while by sliding the leather wheel past the centre a reverse motion is secured. The final drive is by a stout roller chain. In addition to the passenger tri-cars, which have accommodation for two or three persons, and also a luggage platform over the back wheel, a tradesman's machine (Fig. 80) built for the "Evening News," was shown. The machine, which can carry about 3 cwt., has been specially designed with the view to enable the driver to deliver newspapers or goods without stopping the engine, or even dismounting. The lid of the carrier opens from back to front, and is operated by a pedal. The back of the box acts as a dashboard, on which the petrol and oil tanks, lubricating pump, and accumulators are carried. A display of the Stevens petrol motors which are used on the Armada machines was also to be seen at this stand.

Fig. 81.—Chassis of Gracile 30-h.p. Car.

### The Gracile Cars.

A new series of cars known as the Gracile was shown by the GRACILE MOTOR CAR COMPANY, LTD. Pride of place was given to the 30-h.p. chassis, illustrated in Fig. 81. The engine comprises four cylinders cast in pairs, with all the valves operated off a single cam shaft. The ignition is by magneto with high tension distributor, a novel feature being the automatic advancing and retarding of the time of firing the charge. The governor is also connected up to the automatic carburettor. The transmission is by a leather-faced clutch to a gear-box giving four speeds forward and a reverse, controlled by a lever working in a gate, and thence by a cardan shaft to a well-supported live axle

The latter has only to withstand the driving effort, the weight of the car being carried on the external casing. The universal points of the cardan shaft are of a special form, while a noteworthy feature of the vehicle is the great braking power provided. We may add that, with the exception of the engines, ball bearings are employed throughout. Three examples of the Gracile 18-24-h.p. cars, including a chassis, were also on view. Except that the ignition is by accumulators and coil, and is not automatically controlled, these are practically on the same lines as the 30-h.p. car above described. The wheel base is sufficiently long to allow roomy side-entrance bodies to be fitted. The body of one of the cars was hinged at the rear and provided with Thomas' patent lifting device, by means of which all parts of the mechanism are rendered easy of access.

### The Pope Tribune, Service and Minerva Cars.

In addition to a 10-h.p. Minerva two-cylinder car with tonneau-body, the CIVIL SERVICE MOTOR AND CYCLE AGENCY, LTD., had on view one of the latest Pope-Tribune 7-h.p. two-seated cars. The engine is of the single-cylinder vertical type, 4½ in. bore by 4 in. stroke. The cylinder, cylinder-head, and valve chamber are entirely surrounded by water circulated by a belt-driven steam pump. The transmission is of the sliding-pinon type, giving two speeds forward and one reverse, with direct drive on the high gear. A propeller shaft with two universal joints conveys the power from the gear-box to the rear live axle. The car has a neat appearance, and is well worthy of the attention of those looking for a two-seated vehicle at a moderate price. A new model of the Pope-Tribunes was seen in the 14-h.p. double phaeton illustrated in Fig. 82. The motive power is supplied by an engine comprising two separate cylinders, having accumulator ignition. The drive is through a leather clutch to a gear-box, giving three speeds and a reverse, and thence by a cardan shaft to the live axle. Lubrication is effected by a rotary bucket device driven off the crankshaft. Both

Fig. 82.—The Pope-Tribune 14-h.p. Car.

foot and hand operated brakes are provided, and ball bearings are fitted to all the shafts except those of the engine. Another new car shown for the first time was the "Service," which can be provided with either a two-seated or four-seated body. It is fitted with a Gnome double-cylinder 7-8-h.p. engine, 85 mm. bore by 100 mm. stroke, with honeycomb radiator and fan, the water circulation being on the thermo-siphon system. Three speeds forward and a reverse are provided, with direct drive on the top speed. The little car is well worth the attention of those looking for a reliable vehicle at a popular price. A little novelty which attracted considerable attention was seen in the "Turbinamo," a device by means of which motorists may charge their ignition accumulators at home; it consists of a small direct-coupled turbine and dynamo arranged to be driven by means of a hose-pipe attached to the domestic water tap. A display of the "Service" and "Service Billet" detachable non-skid bands and tyre protectors was also included in the exhibit.

### The Mercedes and Leon Bollee Cars.

The CANNSTATT AUTOMOBILE ASSOCIATION had a large stand, on which were shown two well-known high grade makes of cars, Mercedes and Leon Bollee. Dealing with the former, the cars on view included an 18-23-h.p. landaulet, with body by Hooper and a chassis of the latest type of 35-h.p. car. The dimensions of the four-cylinder engine are 110 mm. bore by 140 mm. stroke. The carburettor is of a special type, provision being made for varying the feed of petrol through the spraying nozzle. The clutch is of the metal-to-metal type, while the gear-box gives four speeds forward and reverse. The drive is direct on top speed, this being obtained by the employment of an additional pair of bevel wheels, there being one on the ends of the two shafts in the gear-box and two on the differential shaft. Ball bearings are used throughout, while all the other leading features of Mercedes cars are retained in the latest models. Turning now to the Leon Bollee cars, those on view were of the 25-30-h.p. type, one being fitted with a removable top landaulet body, and the other with a side-entrance double phaeton, with Cape cart hood.

**The Starling Cars.**

Prominent among the small cars in the Show were the Starlings exhibited by the STAR CYCLE COMPANY, LTD., Wolverhampton. Designed for two people, the little cars appear to be of substantial construction, and their moderate price should make them many friends. The motive power is supplied by a 6-h.p. single-cylinder engine 4 in. bore by  $4\frac{1}{2}$  in. stroke, with accumulator and coil ignition, hand pump lubrication, and the thermo-syphon water circulation. The engine is set across the frame, the starting handle being carried through the side-frame member. We noticed that three speeds are now provided, as against only two formerly, supplementary to the reverse. The transmission throughout is by chains, one connecting the clutch with the gear-box, and another conveying the power to the rear live axle. Ample brake power is provided, and with inclined wheel steering, bucket seats, and other handy fittings, the vehicle forms a smart little turn-out for the motorist of moderate means.

**The Rex Exhibit.**

In addition to examples of the Rex single and twin-cylinder motor-bicycles, the REX MOTOR MANUFACTURING COMPANY, LTD., had on view samples of the Rex 5-h.p. Triette and the well-known 8-h.p. Rexette. The chassis of the latter has been strengthened and improved since last season, and the steering gear is now of the rack and pinion type. An improved form of two-speed gear has been adapted, the trans-

Fig. 83.—Plan of Chassis of Starling 6-h.p. Car.

mission to the rear road wheel being by a single chain. Fig. 84 gives a plan view of the Rex Co.'s latest production, the 8-h.p. Airette, it having been introduced to meet the demand for a four-cylinder machine capable of carrying two or three persons, at a moderate price. The frame is of channel steel, and springs are attached to the ends of the same much in the same way as on a car. The engine is of the four-cylinder type arranged in the shape of a double V. The cylinders are water-cooled on the thermo-syphon system. The engine is situated at about the centre of the frame, the crankshaft and gear-box being placed parallel to the axle. The gear-box is adapted to give two speeds, the wheels being always in mesh, one or other of the speeds being locked to the driving shaft by means of dog clutches. The final transmission is by chain to the rear wheel. The road wheels are 24 in. diameter, and the front seat is made wide enough to carry two passengers.

**The Rochet-Schneider and Florentia Cars.**

Messrs. DONNE AND WILLANS, LIMITED, occupied a large stand, on which were shown specimens of the latest types of Rochet-Schneider and Florentia cars. The cars exhibited included a 30-35-h.p. Rochet-Schneider with chain drive. Fig. 85 shows a plan view of the chassis of the 1906 18-22-h.p. car, with live axle drive, a form of transmission which is a new departure for the Rochet-Schneider firm. The engine has four cylinders, 100 mm. bore by 140 mm. stroke. The make and break gear of the low-tension magneto ignition has been considerably improved in the way of ease of adjustment. The transmission is by

internal expanding metal-to-metal clutch, through a small and neat gear-box, giving three speeds forward and a reverse with direct drive on top speed, and thence through a cardan shaft and bevel gear. The pressed-steel frame is raised over the rear wheels in order to allow extra clearance for the differential. Ball bearings of D.W.F. type are employed throughout, except on the engine crank shaft. There are many points of interest in the new car, not the least of which is the

Fig. 84.—Plan of Rex Co.'s 8-h.p. Airette.

clean dashboard—clean from the point of view of being unencumbered with a host of levers, lubricators, and other engine adjuncts. Of the Florentia vehicles a chassis of the 18-22-h.p. model was on view. This vehicle is built in Italy under licence from the Rochet-Schneider Company, and in general design and construction follows the lines of the car described above. Both makes have an excellent reputation for sound

Fig. 85.—Plan of Chassis of Rochet-Schneider 18-22-h.p. Live Axle Car.

construction and reliability, which should be more than maintained by the 1906 models.

**Motor Boats.**

The exhibit of Messrs. JOHN WILESMITH AND CO. was of much interest to those who are following the motor-boat movement. They showed a finely made launch 30 ft. long with 5 ft. 8 in. beam, intended for river and estuary cruising. Messrs. Wilesmith also drew attention to their system of multiple skin construction for motor launches, and a mechanical syren worked off the fly-wheel.

**Cort's Band.**

Type No. 2 of Mr. W. S. CORT'S "Economy" detachable non-skid band was shown for the first time at this Exhibition. This band is made of the same quality of rubberised chromed leather as that previously introduced, and the tread is studded with precisely the same class of studs. When worn down it can be retreaded at half its original cost, making it equal to new; in fact, the only difference in this band to the original one is in the fastening. No. 2 is fitted with steel clips, which fit into the rim. For safety against side skids or punctures, for durability, and for economy this is a capital band, and can be attached or detached in a very few minutes.

**The "C.O.C." Chassis.**

The CHASSIS CONSTRUCTION COMPANY, of Taunton, who are making a speciality of turning out chassis to which any type of carriage body can be fitted, exhibited examples of their 16-20-h.p. live axle and 24-30-h.p. chain-driven machines. The majority of the component parts are the manufacture of the well-known French firm, Messrs. Malicet and Blin, while the engines employed are those known as the Ballot. We give a sectional view of the 24-30-h.p. motor. The four cylinders, which are cast separately, are 110 mm. diameter by 130 mm. stroke; the valves are arranged on opposite sides, being actuated off separate cam shafts. The lubrication of the engine is maintained by a mechanical pump driven off one of the camshafts and constantly circulating oil to the crankshaft bearings. The pump sucks from a special chamber below the crank case, but before reaching this chamber the big ends of the connecting rods dip into the oil bath for splash lubrication of the cylinders in the usual manner. Means are provided for a separate supply of oil from the reservoir on the dashboard beneath the bonnet in case of failure of the pump. The Hele-Shaw metal-to-metal disc clutch is employed for transmission between the engine and gear-box. Three

Fig. 86.—Section of Ballot 24-30-h.p. Four-cylinder Motor.

- |                     |                                      |
|---------------------|--------------------------------------|
| A. Cam shaft.       | L. Water inlets.                     |
| B. Connecting rods. | m. Bevel gear driving contact maker. |
| C. Cylinders.       | n. Piston of Oil Pump.               |
| c. Cams.            | V. Crank shaft.                      |

speeds and a reverse are provided. A short universally-jointed shaft is interposed between the gear-box and the differential shaft so as to keep the chains of moderate length. Except for the transmission the 16-20-h.p. car is on similar lines to the 24-30-h.p.

**The Conveyance of Cars.**

Messrs. HENRY JOHNSON AND SONS had a model of a crate used in the transport of automobiles, and took advantage of the opportunity of reaching the automobile public, giving those interested particulars of their methods of packing and transporting automobiles.

**The Insurance of Cars.**

The GENERAL ACCIDENT ASSURANCE CORPORATION, LTD., drew attention to the policies issued covering accidents to owners, drivers, the public, and the car, reductions on premiums being made to members of the Motor Union.

**The Renault Cars.**

An interesting display of several of the 1906 models of Renault cars was made by Messrs. A. GAAL AND COMPANY. The new 8-9-h.p. double-cylinder car is, as might be expected, as good a piece of work as can be found of its size, and the well-known lines are retained as in the other models. The carburettor has been again modified, a single jet with an auxiliary air-valve rising and rotating, but always partly open, being its chief points. The cylinders are 90 mm. bore by 120 mm. stroke, and the valves are mechanically actuated. The gear is of the Renault and Co.'s special type, giving three speeds and reverse, the drive passing through a cardan shaft and bevel gear to a live axle. The vehicle is made in two lengths of chassis, one having

a wheel base of 7 ft. 10 in. and the other 8 ft. 8 in. A chassis of the 14-20-h.p. model (Fig. 87) was also on view. The dimensions of the four-cylinder engine are 90 mm. by 120 mm. A governor is provided, this acting on the admission; it can be cut out when desired by means of an accelerator pedal. Ignition is by a Simms-Bosch high-tension magneto; a special fastening of the ignition wires allows each cylinder to be easily tested at once. The carburettor is of the automatic type; the supplementary air is obtained through a movable cylinder working up and down a fast screw through the suction

Fig. 87.—Chassis of Renault 14-20-h.p. Car.

of the pistons. The cooling is effected by water circulation on the thermo-siphon system, which dispenses with pumps. A notable feature of the Renault cars is the fitting of a double tank radiator on the dashboard instead of at the front end of the engine, giving perfect accessibility of the latter. A fan is fixed on the flywheel to induce a current of air through the radiator. The clutch is of the leather-faced cone type; it abuts against a flange connected with the flywheel, having a series of slits in the internal periphery. These slits act as springs, and, as the clutch is let in, the drive is taken up without any shock. The complete cars on view comprised a 14-20-h.p. limousine and 20-h.p. side entrance double phaeton. The Renault vehicles are amongst the most popular types at present on the market, this position having been achieved by their general reliability and wonderfully silent operation.

**The Barford and Perkins Motor Roller.**

Messrs. Barford and Perkins, of Peterborough, made their first appearance at the Agricultural Hall display with one of their motor rollers (Fig. 88), which are being extensively used for rolling lawns, cricket grounds, etc. This machine is a combination of the well-known patent water-ballast roller with a petrol motor of the same class as is used in motor vehicles. The rear roller is made of hard cast metal of ample strength, and the smallest size holds half a ton of water. The iron frame is stiffly braced together, the fore part being coupled to the front rollers by a steering head and bridge. Springs are used over the back axle to minimise vibration and strain on the frame. The motor is of the single cylinder vertical type, of 8-h.p. It is water-cooled, a sufficient body of water being carried in the circulating tank to enable the cooling to be efficiently done without the aid of a fan or radiators. The tank is placed over the rear roller, so that its weight is in a useful position, while at the same time its height renders a pump unnecessary, the circulation being by gravity. A friction clutch on the

Fig. 88.—Messrs. Barford and Perkins' Water Ballast Motor Roller.

motor spindle allows the engine to run free for starting. Two speeds, either forward or backward, are arranged for, viz., one mile and three miles an hour, the change being conveniently made from the driver's seat. By varying the number of revolutions made by the engine intermediate speeds can be obtained. The steering is controlled by a hand wheel in front of the driver. The bridge spanning the front rollers allows a considerable oscillation of the latter when passing over stones or other obstructions without affecting the level of the main frame. All levers for controlling the motor are within easy reach of the driver. We understand that Messrs. Jarrott and Letts have just placed an order with Messrs. Barford and Perkins for a 14-h.p. roller for Lord Dunraven, the machine being intended for use on the latter's estate in Ireland.

### The "Scout" Cars.

Two interesting examples of the "Scout" cars, of respectively 14-17-h.p. and 17-20-h.p., were shown by Messrs. DEAN AND BURDEN BROS., LTD. The frames of the vehicles, which are of British construction throughout, are constructed of wood and steel. The motive power is supplied in each case by four-cylinder engines, the 14-17-h.p. being 83 mm. bore by 115 mm. stroke and the 17-20-h.p. 90 mm. by 115 mm. The cylinders are all cast separately, and the ordinary suction type of inlet valve is retained. The carburettor is of the float-feed spray variety, and a noteworthy feature, and one which is undoubtedly on right principles, is the provision of separate admission pipes for each cylinder from the point where the throttle valve is fixed. Ignition is by coil and accumulators, or by high-tension magneto, as desired. The radiator is of the framed ribbed-tube variety, the water circulation being maintained by a gear-driven pump. The throttle lever is mounted on the steering wheels, while the ignition and air-control levers are fixed to the pillar below the wheel. An accelerator pedal is also provided, to put the governor out of action when desired. On referring to the illustration of the "Scout" chassis it will be seen that a large silencer is fitted at the rear, with a long exhaust pipe leading to it; each cylinder exhausts its burnt gases in a chamber, where it expands, and thus relieves the cylinders of all back pressure;

### Mobiloil.

THE VACUUM OIL COMPANY, LTD., has established a reputation in connection with lubricants, oils and greases for automobiles, several of its specialities being shown in a handsome case at the exhibition. Prominent among these was the Vacuum graphite grease for chains, Autovanols for motor-omnibuses, special oils for motor-boats, with heavy oil motors as well as "Mobilubricant" for pressure, grease cups, in addition to the standard mobiloils for motor-cars, cycles, and boats.

### The Cassell Gaiter.

On the stand of the GLASGOW MOTOR TYRE COMPANY a new motor tyre gaiter appeared during the Show, this consisting of a fabric band, which, being clipped on to the rim, should enable the motorist to continue his journey with security. To show the contrast between the effect of water on this fabric and on leather, specimens of each were kept in water during the Exhibition, demonstrating that the former was entirely unaffected.

### Carburettors and Petrol Gauges.

Messrs. BROWN AND BARLOW, LTD., had a good display of their well-known productions, including the carburettors fully described in our columns in the Show reports in November last. An interesting exhibit at this stand was a petrol gauge for gravity and pressure feed which is

Fig. 89.—Chassis of Scout 17-20-h.p. Car.

the gas then travels down the exhaust pipe to the silencer, where this is so directed as to still further cool and contract, finally emerging with scarcely a perceptible noise. The clutch is of the leather-faced cone type; one of its main features is the employment of three springs which can be adjusted externally. A jointed shaft connects the clutch with the gear-box, which is adapted to give three forward speeds and a reverse. The final drive is through a cardan shaft and bevel gear to a specially strong live axle. The cardan shaft is provided with a special form of universal joint, in which the connecting pin runs in case-hardened bushes, both being so arranged that they may be readily removed. At the rear of the gear-box is mounted the foot-controlled brake, combined with which is a ratchet sprag to prevent the car running back on hills. Messrs. Dean and Burden Bros. also exhibited examples of their 3-h.p., 6-h.p., and 12-h.p. petrol motors for motor-boat work, and of their 15-h.p. and 30-h.p. commercial marine engines.

### The L'Electrophone.

On the same stand whereon Messrs. GAUTHIER AND Co. exhibited the Longuemare carburettors and Basseé-Michel electrical ignition specialities they also enabled the public to judge of the value of their Electrophone, a new automobile horn worked on the principle of the electric bell from a battery. There is no rubber bulb or tubing, and the horn emits a distinctive sound by merely pressing a button without the hands of the driver being taken from the steering-wheel.

quite independent of the position of the tank. The  $\frac{3}{4}$ -in. tube supplied is fitted into the petrol tank, reaching to within about  $\frac{1}{4}$ -in. of the bottom. The top of this tube is provided with a union, and the small copper pipe fitted to connect the union to that at the bottom of the petrol gauge. When pressure feed is used for the petrol, another union is provided at the top of the petrol gauge, which must be connected either with the top of the tank or to some portion of the pressure system between the pressure valve and the tank. Altogether the exhibits of Messrs. BROWN AND BARLOW represented a high standard of British manufacture.

### Lamps, Horns, Etc.

As usual, Mr. G. GOLDSCHMIDT had a good display of his specialities, mainly in lamps and horns. The Zanardini head and tail lamps were objects of considerable interest, having now won a good position in the British market. Some good types of square lamps for voitorettes and landaulets were also on view as well as some new tail lamps for larger cars. The G. G. lamp was a particularly notable exhibit. Horns of deep sound were another feature of the stand as well as the anti-splash funnels which have been previously referred to in the M.C.J., and goggles, accumulators, voltmeters, etc.

THE "Dagro" accumulator was shown by Messrs. Dayrell and Groombridge, who are giving special attention to ignition cells for motor-cars and the like. They have special facilities for quickly and thoroughly charging and repairing accumulators.

**The "Leyland" Motor-Bus.**

The new motor-bus chassis exhibited by the Lancashire Steam Motor Company, Ltd., attracted considerable attention. It differs in several respects from last year's model, the changes having been made as a result of the experience gained with the vehicles in actual operation during the past twelve months. The frame is of channel steel having a depth of 4½ in. by 2½ in. wide. The four longitudinal springs, which are exceptionally long and wide, are supplemented by a transverse one at the rear. The motor, which is rated at 30-40-h.p., is designed to run at a normal speed of 800 revs. per minute; the rate can, however, be varied from 200 to 1,250 revs. The cylinders are 4½ in. diameter by 5½ in. stroke. The

of the engine are provided with ring lubrication. The main oil-tank is fitted to a sight feed distributor on the front of the dashboard. The speed of the engine is controlled by means of a lever fitted in a convenient position, operating the throttle valve. The clutch pedal is also so connected up with the throttle that as the clutch is withdrawn the speed of engine is automatically down to about 200 revs. per minute. The petrol tank, which is situated under the driver's seat, is cylindrical in form and has a capacity of twenty-four gallons. The clutch is of aluminium, of the ordinary cone pattern. The spring is separated from the clutch in a position easily accessible for adjustment. Between the clutch and the gear-box a double universal joint is

Fig. 90.—Chassis of Leyland Motor 'Bus, showing New Arrangement of Radiator.

water jacket provides an abundant supply of water around the combustion and valve chambers and is of such a length that the piston rings do not at any part of the stroke pass below the water jacket. The base chamber is of aluminium cast solid with lateral arms extending to the side members of the main frame; it is fitted with inspection doors and special arrangement for lubrication, and also useful fittings for collecting any surplus lubricating oil. The main crankshaft bearings, which are of phosphor bronze, are independent of the bottom casting, so that the latter can be readily removed to allow of inspection and adjustment. The inlet and exhaust valves, which are of nickel steel, are mechanically operated off separate cam shafts. The water circulating pump is of

provided, which prevents undue strains being set up when travelling over rough roads. The gear-box, the shafts of which run on ball bearings, is adapted to give three speeds forward and a reverse, operated by a single lever, working in a quadrant the notches of which are clearly lettered first speed, second speed, etc. The transmission is on entirely new lines. The power from the gear-box is conveyed by a cardan shaft and bevel gear to a short differential shaft located in and carried by the casing surrounding the back axle. A feature of the cardan shaft is that it is supported at about the centre in a patent spherical thrust block which takes the thrust direct to the frame, and also forms a three-point support to the axle,

Fig. 91.—Side View of Chassis of Leyland Motor 'Bus.

the centrifugal type, and is gear-driven and of very large capacity. Large pipes are employed, they being 1 in. internal diameter, so that the friction of the water through the same is reduced to a minimum. Ignition is by Simms-Bosch low tension magneto, provision being made to test the firing in each cylinder separately. The radiator, which is of the ribbed-tube type, is now located at a lower level than last year. It is provided with a fan running on ball-bearings direct on the engine crankshaft, so that the use of a belt is avoided. The induction and exhaust pipes are fitted with registers, so that not only are they perfectly fitted to the cylinders, but, in addition, the joint or packing is properly protected and cannot be blown out. All the main bearings

thus preventing any strain due to uneven roads being transmitted either to the engine, gear, or frame. As mentioned above, the differential is mounted in front of the rear axle. Short shafts project on each side, and on these are mounted straight tooth pinions which mesh with corresponding spur wheels on the live axle, a reduction of three to one being obtained in the drive. The casing enclosing the driving gear is fitted with a cover which enables it to be readily inspected and removed without it being necessary to take the axle casing down. Double acting brakes are fitted on the gear shaft and on drums on the rear road wheels. The pedal brake, which is of wide dimensions, is of the locomotive type. The side brakes, which are of the internal-expanding

type, are actuated by a hand lever; they are compensated one with the other, so that the pressure on each is equalised. Special attention has been paid to the steering gear, which is of the usual worm and segment enclosed in an oil-tight box. The front road wheels are properly trammed so that they automatically compensate themselves on either lock. The axles, which are made of vanadium steel, are provided with large wearing surfaces, while the road wheels are of "Leyland Composite" pattern, having steel centres and wooden felloes, 5 in. single rubber tyres being used at the front, and 5 in. twins at the rear. The vehicle has a wheel base of 13 ft. 3 in., the overall length being 22 ft. 9 in.

#### The Royal Windsor Delivery Van.

A serviceable motor delivery van (Fig. 92) designed for loads up to 20 cwt., was exhibited by the INDUSTRIAL MOTOR CO., of Windsor. The

Fig. 92. The Royal Windsor Delivery Van.

frame is built up of angle steel having a vertical depth in the centre of 5½ in., bolted to a stout ash frame, the combination resulting in very great strength. The engine comprises two vertical cylinders, 4 in. bore by 5½ in. stroke, and develops 12-h.p. at a normal speed of 950 revolutions per minute. The inlet and exhaust valves are mechanically operated off one cam shaft and are interchangeable. The lower part of the base chamber is so arranged that it can be removed without disturbing the crank shaft, and the upper portion is fitted with a large inspection door. The water circulation is maintained by a gear-driven pump and flat tubular radiator with fan. The power is transmitted through a leather-faced cone clutch of extra large diameter and width to a gear-box made of gun-metal instead of aluminium as usual. The change-speed gear is of the sliding type, giving three forward speeds and reverse, with direct drive on top speed. A universally-jointed shaft connects the gear-box with the ball bearing differential shaft, side chains conveying the power to the rear road wheels. The ratio of gearing is adapted to give a top speed of from twelve to fourteen miles per hour. The road wheels are of artillery type, the front being 32 in. and the hind 36 in. in diameter, shod with solid rubber tyres. This large diameter has been adopted to enable the wheels to bridge over road depressions instead of bumping into them. Two independent brakes are fitted: the foot brake acts powerfully on a drum located at the back of the gear-box, and the hand brake acts on drums fixed to the back of the rear wheels. The ignition and throttle levers are mounted above the inclined steering wheel, but do not turn with it. Special attention has been paid to the lubrication as well as to the bearings, the latter being of such a length as to ensure a long life to the vehicle.

#### The Motorium Buses.

THE MOTOR CAR EMPORIUM, LTD., exhibited two omnibuses and an observation car. The first omnibus was of the D.M. or Ducommun-Muff type, having a four-cylinder engine of 110 mm. diameter by 110 mm. stroke, designed to give 24-h.p. at 1,000 revolutions per minute. The cylinders are cast separately, but the special point is that the camshafts are two in number, they being disposed crosswise, and are driven by skew gearing from the crankshaft. The valves are on opposite sides and are operated by tappets. Ignition is in duplicate by accumulators and coil. There are four forward speeds and a reverse, operated through a gate, and a live axle drive with a special double drive to the differential to obviate the thrust of the bevel drive. The body is London made and is painted with the name "Reliance," and intended to work on the same route as the "Rapid" omnibuses, from Hammersmith. Next to this was staged a 22-seated observation car, with an "S.B." type chassis, having a two-cylinder engine of 15-18-h.p. with accumulator ignition. It has a large cone clutch and gate change-speed, providing four forward speeds and a reverse. The final drive is by roller side chains. The third vehicle was an "S" type omnibus of Swiss manufacture, with a 30-35-h.p. engine having four cylinders 115 mm. diameter by 140 mm. stroke, cast in pairs. The valves are on opposite sides, and

the ignition is high tension in duplicate, by Simms Bosch magneto and by accumulator and coil. The special point is the provision for using the engine as a brake. The throttle lever first closes the throttle valve through which the carburetted air is admitted to the induction pipes, and then by a further movement pushes the cam shaft forward so that the lift is gradually reduced, and if the lever is moved to the full extent, the valves, both inlet and exhaust, do not open at all. The engine is thus converted into a very effective air-brake. The fan is mounted on a bracket on the engine casting, with a strong spring in the stem, so that a uniform tension is kept on the fan belt, and it is even possible to use an endless belt if desired. A leather-faced cone clutch is employed, and three pedals are provided, one operating the clutch only, the second the clutch and brake combined, and the other operates the brake alone. The channel frames are quite straight, thus obviating the weakness due to the usual set in at the driver's seat. Four forward speeds and a reverse are provided, worked by a single lever through a gate, the highest speed having a direct drive to the countershaft. The final drive is by roller side chains from the differential countershaft to the road wheels.

#### The Scowen Automatic Change Speed Gear.

Messrs. SCOWEN, LTD., exhibited a Gregoire 8-h.p. two-cylinder chassis, fitted with a new automatic change-speed gear by means of which the usual side change-speed lever is entirely dispensed with, the change being effected by simply declutching, a small indicator, which is conveniently fixed to the steering pillar, having previously been set at the desired position. The gear formed one of the novelties of the show and attracted considerable attention. Without drawings it is hardly possible to describe the arrangement, but we may state that the indicator fixed on the steering column is connected up by a series of universally jointed rods to what is known as a selector spindle. The latter is located in a side chamber in the gear-box and is provided with a number of teeth or stops. As the indicator is set for any one of the speeds the selector-spindle is rotated so that, as the clutch is fully withdrawn, the sliding sleeve on which the change-speed pinions are mounted, and the shifting mechanism of which is connected up to the clutch pedal, is moved along automatically as far as it is allowed by the stop, and the requisite pair of gears brought into mesh. As the sliding sleeve is moved along to give the higher gears, a spring is compressed, the force of the latter being relied upon to bring the sleeve back when it is desired to drop down from the third to the second, or from the latter to the first speed or reverse. The gear, which is exceedingly ingenious, is claimed to be fool-proof and can be adapted to almost any form of sliding change-speed gear. So far as could be gathered from the demonstrations on the chassis it appeared to work very satisfactorily, and we shall look forward to the development of the idea in practice with much interest.

#### The Helios Lamps and Acetylene Generators.

The Helios lamps and acetylene generators, handled in this country by Mr. EUGEN BAEDEKER, have points of merit conducive to the continuance of their popularity with motorists.

#### The Glover Delivery Van.

Messrs. GLOVER BROS., LTD., exhibited a serviceable motor delivery van (Fig. 93) designed for loads up to 20 cwt. The vehicle is fitted with an Aster 14-h.p. double-cylinder engine, located under the driver's seat,

Fig. 93.—The Glover Motor Delivery Van with Detachable Body.

the transmission being on the usual lines of chain-driven machines, the top speed being about 17 miles per hour. A feature of the van lies in the method of fixing the body on the chassis; it consists in mounting it on rollers, so that, by undoing a few bolts, it can be rolled back on the frame to give free access to the engine and other parts of the driving-gear. We understand that Messrs. Glover have a large number of orders in hand for vans of the type illustrated, they being able to show that, as compared with horse traction, considerable economy in the cost of delivering goods can be effected by the use of automobiles.

### The Primat Alterno Rotary Motor.

Reference has already been made to the fact that, from a motor engineer's point of view, one of the features of the Show was the alternorotary petrol motor exhibited by Messrs. A. PRIMAT AND CO. Fig. 95 gives a general view of the engine, while Fig. 94 shows on the left the arrangement of the valve gear and on the right a sectional view through two of the cylinders. There are altogether four curved cylinders formed in a single casting, within which work pistons of corresponding form, each having its own combustion chamber. Only one of the pistons is provided with a connecting rod, the lower one on the right in Fig. 94. The power developed in the other cylinders is

Fig. 94.—Part Sectional Elevation of Primat Motor.

transferred to the crank shaft by connecting them in pairs by two bridge pieces, the latter being in turn attached to an arm, the whole forming a kind of I shaped piece which can oscillate on the central spindle. The action in each cylinder is similar to that of a four-cylinder motor, each having its own sparking plug, inlet and exhaust valves, the latter being all mechanically actuated. The principal claims made for the arrangement are its light weight and small size, the engine occupying a much smaller space than the usual engine with four vertical cylinders. Messrs. Primat are building these engines in sizes from 10-h.p. upwards, a special plant having been installed for turning the curved cylinders and pistons; they are also making a motor on similar lines but fitted with a special camshaft by means of which the direction of rotation of the crank shaft can be reversed.

### Frames, Etc.

Of general interest to the public and particular value to the trade was the stand occupied by Messrs. BEARDMORE AND CO., LTD., whose facilities of production have come to the aid of the motor-car maker at an opportune time. They are making hydraulically pressed frames and channels in nickel or mild steel for cars, omnibuses and wagons, cast steel wagon wheels, rolled solid steel weldless rings for wood wheels, steel castings, etc.

### Motiphos.

MILLENNIUM, LIMITED, made a bold display of the B.S.T. motor oils and grease, calcium carbide and other preparations for the comfort of motorists. Included in the display was a selection of Motiphos, which has made great progress in the favour of motorists since first noticed in the *M.C.J.* in November last. As a compound for dealing with slipping belts and friction clutches it has proved most efficacious and a useful preparation.

### The "Warley" Spring Wheel.

Having been previously described at length in the *M.C.J.*, the "Warley" spring wheel need not be referred to in detail on the present occasion. It was shown by Messrs. Estler Bros., who also made a good exhibit of aluminium alloy castings, jacks, etc., as well as of the "Warley" tyre, which is made up of a series of rubber blocks attached to a rim of ordinary channel section with sloping sides, and forming a device of considerable merit, in which, it is claimed, the danger of side-slip is eliminated. The "Warley" spring wheel has lately attracted much notice, and its presence on the road will be watched with interest during the coming season.

### An Inflated Rim.

To avoid some of the roadside troubles incidental to motoring, the Cave Quick Change Tyre Rim has been lately introduced. In November last we suggested that the future of the device would be closely followed by practical motorists, and from the attention bestowed on the stand whereon it was shown at the Exhibition it is evident that favour has been gained. Briefly stated, the system may be described as one of interchangeable rims. Any standard make of pneumatic tyre can be fitted and all spares are carried ready inflated.

When the tyre is punctured it can be easily removed and a new tyre mounted on the felloes in a couple of minutes with the aid of only a box spanner. The security bolt has been improved since the first appearance of the device, as the head is now affixed by a bayonet joint instead of a screw—a conspicuous advantage.

### Accessories.

Messrs. MESTRE AND BLATGE, of Paris, took advantage of the opportunity to favourably introduce themselves to the British market, showing a representative collection of horns, lamps, jacks, and other accessories of importance to motorists. Several good types of sirens were on view, as well as the Imperator non-skid and a selection of electrical devices of interest.

### The Paradox Variable Gear.

An ingenious variable speed gear for use on motor-cars in place of the usual sliding pinion type was exhibited by the PARADOX GEAR COMPANY, of Bournemouth. The gear is of the epicyclic type, which, in contradistinction to the ordinary form, is not confined to two speeds only, but gives any speed. Without drawings it is not possible to clearly describe the mechanism, but we may state that the locking and releasing action is performed by means of worm gear, this in turn actuating a variable friction-disc and roller mechanism. The gear is so arranged that none of the engine power is transmitted by the friction mechanism, the sole function of the latter being to release an active thrust, but never to drive. All the gears are always in mesh, and, run in oil; the whole mechanism is very compact and on the top speed gives a direct drive.

### The "Unedalite" Lamps.

Messrs. WILSON, BROWNE AND SON were among the lamp firms who found plenty of business at the show, particularly with a new pattern headlight of taking design. In this the generator is contained in the body of the lamp behind the reflector, which is detachable. To get at this the top of the lamp swings back on a hinge, preserving its shape and unbroken appearance. There were several other new types on the stand, one being a lamp that can be used either as a paraffin or electric side-light. A neat design of brass tail lamp was also included among the exhibits. Besides having the usual number plate illuminator and rear ruby light, it has an opposite reflecting side which enables the driver of the car to easily perceive that the light is burning, a decided advantage that will be appreciated by the victims of tail lamp troubles. The "Unedalite" lamps, which is the name given these excellent productions, are made in several varieties, and there is a good demand for the firm's small size for tri-cars, fore-carriages and similar vehicles. This has jewelled side-lights as well as the back light, and is fitted with Messrs. Wilson, Browne and Son's special locking attachment, so that the container is absolutely secure and cannot be lost.

### The "Perfect" Tyre.

Messrs. D. MOSELEY AND SONS, LTD., had a good display of their motor tyres, the quality of which has been demonstrated on the road for several seasons. Their "Perfect" tyre naturally attracted much notice from visitors, its ease of attachment or detachment being made clear by attendant operators on the stand. The rim is fitted with a side ring in which is a turn buckle by which it can be expanded or contracted. When covered by the clip the turn buckle is hidden from

Fig. 95.—General View of Primat Motor.

view. The result of this arrangement is that the tyre can be removed from the rim on the road by a novice, and a new inner rim inserted in five minutes without physical exertion. Rim-cutting is impossible, and the risk of nipping or pinching the tube is obviated. The simplicity of the "Perfect" tyre is such that no security bolts are needed and a small steel tommy bar is all that is required to assist the removal or the attachment of the tyre. When in position the tyre will not creep, and the experience of users has given them confidence in recommending this tyre to fellow motorists. The Moseley non-skid tyre shown on the stand has been recently illustrated in our columns.

**Auto-Lubrine.**

The AUTO-LUBRINE COMPANY had a comprehensive display of their specialities, including auto-lubrine—a pure hydro-carbon with a very high flash point. Having given the oil a trial during a period of varying weather, we can testify to its freedom from acids and impurities and to its general excellence. Included among the exhibits of the Auto-Lubrine Company was a capital preparation for removing grease and dirt from the hands, as well as graphite motor grease, pure flake graphite, gear oil, yellow motor grease, etc.

**"Selvyt."**

"Selvyt" has become a standard article among motorists, and the display in the Arcade revealed its manifold uses. The exhibit was thoroughly comprehensive, and reflected credit on those responsible for the

Fig. 96.

Fig. 97.

effective showing of the "Selvyt" specialities. The fabric has the advantage of leaving no lint when employed as a duster. For the painted work of cars it is a splendid cloth with which to wipe the bodies after hosing and sponging, as it will take up and absorb any grease remaining, leaving a bright and glistening surface without spreading the grease and leaving a smear—a result sometimes found with other cloths. "Selvyt" is made in single and

**Messrs. Pullman's Specialities.**

At every exhibition the exhibits of Messrs. R. and J. PULLMAN, LTD., grow in number and variety. The non-skid bands, of course, continue to be the prominent feature of the display, their good wearing qualities finding their latest attestation in a letter received from Mr. F. F. Wellington. The bands are made in various types to suit different sizes and weights of cars. Emergency and non-skid gaiters were also on view, as well as the Pullman type lever previously illustrated in our columns. Having been associated with the leather trade many years, the firm are naturally able to cater well for the wants of motorists, and their gloves and gauntlets are of particularly attractive quality. Mention may also be made of Messrs. Pullman's "electric chamois leather," for cleaning the metal work of cars, a delightful material to handle and one that will remain soft and supple after long wear and frequent wetting. A new graphite lubricant lately brought out by the firm was also shown.

**The See Non-Skids.**

The See non-skidding bands were shown by the OTTO-BENNETT MOTOR AND ENGINEERING COMPANY, whose exhibit also included the See gaiters and the See vulcanising fluid, this latter being a capital preparation for vulcanising patches to inner tubes. They also exhibited a good tool kit, in which a number of essential tools can be assembled within a neat leather case. The See gaiters are made from chromed leather and are provided with a double thickness on the tread, the shape being carefully fashioned so that it can be adapted closely to the cover. The fastening is simple and secure and they can be usefully employed for weak places on the cover until the tyre can be sent for repair. An important part of the Otto-Bennett Company's operations is that relating to tyre repairs, a special plant having been laid down for dealing with such work.

**The Durandal Non-Skid.**

The Durandal detachable band was shown by Messrs. H. CINTRAT, LTD. The main features of this device are well known. Suffice it now to say that it affords protection to the outer cover and prevents the tyre bursting or puncturing, while also serving as a guard against side-slip, owing to the presence of hardened steel studs. The Durandal band can be fitted to worn covers as well as to new ones. Those who have not hitherto employed non-skids will be interested to know that this has stood the test of four years' experience.

**The Peter Union Tyre.**

Of general interest to motorists was the display of the PETER UNION TYRE COMPANY, LTD., including tyres for heavy and light cars as well as puncture proof bands for all classes of tyres. Mention may first be made of the Peter Union studded motor-cycle tyre, in which the studs are firmly inserted in the outer cover itself, by which means durability and lightness are retained, and, in addition, the fear of puncturing and side-slipping possibilities reduced to a minimum. Generally attractive to a

large section of visitors was the solid tyre for heavy vehicles and motor-omnibuses. This has an endless steel band, which is vulcanised into the hard rubber to hold the tyre tightly on the rim and thus prevent creeping. It also prevents the tyre stretching. Owing to its particular location in the hard rubber, and its great strength the steel band cannot either tear or cut the soft rubber. Each of the tyres are made in a separate mould, therefore have no joint, and, being endless, always remain exactly the same size as when first manufactured. In the construction of the patent rim the makers have departed from the present system and have divided the rim into two parts, viz., the iron rim, which is attached to the wood felloe of the wheel in the usual manner; the detachable side flange or tension ring, made detachable from the outside. As the iron rim is provided with a groove about 3 mm. deep, and the tension ring with a projection, or shoulder, which fits exactly into this groove, it is impossible for the rim to get loose or spring off. The puncture proof bands shown by the company are made in one endless circle of red rubber, and are intended to be placed between the outer cover and the inner tube.

**The Spherola Spring Wheel.**

Of considerable interest and great attraction was the display of the SPHEROLA SPRING WHEEL COMPANY, which included working models of the speciality of the company, as well as specimens of the wheels, which were fitted to a 30-h.p. car utilised for trial runs outside the Hall. The important feature of the Spherola spring wheel consists in the transmission of the vertical load to horizontal springs, through the medium of hardened steel balls rolling between pairs of shallow hardened steel cups, situated at the points of an equilateral triangle surrounding the axle. Three pairs of these cups are placed back to back in the central plate, to which the spokes and rim are attached. Opposite each face of this central plate is a loose triangular plate, with a steel cup let in at each corner. One hardened steel ball keeps each pair of opposing cup faces asunder, and coiled springs press the triangular plates strongly towards the central plate. The triangular plates are prevented from moving by means of radius rod or links, and an axle load tending to lower these plates, rolls the balls out to the shallower portions of the cup and compresses the springs until they carry the entire load. Any reasonable horizontal strains are taken care of by the springs acting as buffers, and when these are closed home suitable stops prevent further movement. The curved surfaces of the cups are the result of careful experiments and rigid mathematical analysis. At present they are designed to exactly imitate the resiliency of a pneumatic tyre, both in amount of travel and in load carried at any given deflection. The results obtained, however, are claimed to be superior to those associated with the ordinary tyre.

**The Darracq Cars.**

A varied range of Darracq cars was exhibited by the LONDON AND PARIS AUTOMOBILE AGENCY, LTD. The models on view were all of the 1906 type, and included examples of the 8-h.p. single-cylinder, 10-h.p. double-cylinder and 15 and 20-32-h.p. four-cylinder cars, all of which have already been described in these columns.

**The Pioven Shield.**

A distinctly attractive novelty was the Pioven rain and wind shield shown by the company of that name. Instead of glass celluloid is employed thus avoiding the risks that arise when stones are flying. It

Fig. 98.—The Pioven Wind Shield.

can be mounted in position for use and dismantled in two minutes. When in use there is a clear space in the line of sight, so that the driver can proceed in rain, hail or snow with no inconvenience. It is shown in Fig. 98 sloping back to reduce windage. The shield can be let down to any desired height. The operation of mounting in position or dismantling need not take more than two minutes, and its elegance and strength combine with lightness to give it favour. Folding into a small box, which can be set on any square dashboard without special fitting, the Pioven shield is one of which much should be heard in the early future.

(To be concluded).

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, W.C.]

### MOTOR NOTES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you be good enough to allow us to lodge an emphatic protest against the absurd writing of the "Motor Notes" contributors associated with the general Press? We know that in a few exceptional cases the "Motor Notes" contributed to one or two of our metropolitan daily newspapers are written by gentlemen who have a thorough grip of the subjects on which they write. As a rule, they are well informed and their criticisms are invariably of a practical character. On the other hand, there are many "journalists" now contributing motor matter to weekly and other papers whose knowledge of motor-cars and motor tyres is obviously very meagre, since the most stupid criticisms and suggestions are published by these men from time to time. Every paper, of course, has a perfect right to make a feature of "Motor Notes" just as it made a feature of "Cycling Notes" when the cycle boom was on, but what we

for the "necessarily increased cost," and he thinks this must be answered in the negative. Will you permit us to say there is no increased cost; therefore, as it is admitted there is an increased life, that is one to the good of the offset crank shaft, instead of the other way about. The whole difference consists in the shape of the crank case casting and the altered position of the bearings in it, and it costs no more to build an engine this way than in the ordinary method. Even supposing, however, that there is an increased cost, it cannot possibly be very much, and seeing that there is a definite increase of efficiency, or, conversely, a definite saving in power to effect the same result, it must necessarily follow that there will be, all other things being equal, a corresponding economy in fuel consumption. This may be small, and doubtless is, but it is going on all the time, and in the aggregate will certainly very greatly exceed any possible increased cost in first construction.—Yours truly,

THE DURYEA MOTOR COMPANY.

### DOES LOW TENSION MAGNETO IGNITION GIVE GREATER POWER THAN HIGH TENSION?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read a good deal lately in your valuable paper *re* high tension and low tension magneto ignition, and should like to give my experience with both these forms. Four years ago I bought a 12-16-h.p. car with low tension magneto, and very soon got sick of it, as, unless the break was exactly right with the place of the shield

The Crown Prince and Princess of Germany arriving at a Military Reception at Homburg.

complain of is that the notes contributed are so misleading that a great deal of harm must be done among a certain section of the public by the misrepresentation of facts and the reiteration of arguments which have absolutely no foundation. In our capacity we have, perhaps, had more opportunities of discovering this lack of motor knowledge than any other firm, since our business is necessarily associated with quite a new phase of the motor industry, and so many writers nowadays discuss the question of tyres and their upkeep, recognising as they do the importance of the question. Just to show you what ignorance exists among some of the "Motor Notes" contributors, we may tell you that we have lately had several of these gentlemen down at our demonstrating departments, and have discovered in course of conversation that they know very little about motor-cars or motor tyres. It seems to us a very great pity that editors of reputable publications do not take greater care in the selection of their motor contributors, for many of them are frequently off the rails, and the most absurd opinions are expressed, to the constant bewilderment and suspicion of the people who read them.—Yours truly,

H. HARVEY FROST.

### OFFSET CRANK SHAFTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Permit us to say a few words with reference to Professor Hunsicker's article in your issue of the *M.C.J.* of the 31st ult. This is headed "An adverse view," but we are unable to see anything adverse in it. The article asks if the increased life of the engine will compensate

the power of the engine was greatly diminished, which meant that if the tappets are the slightest bit worn the break was too soon, and meant re-timing very frequently, so I put in the Eisemann high tension and swept away all tappets and camshaft; the engine pulled better than it ever had before and was also quieter, as there was no make and break mechanism. Lately we have got a 24-30-h.p. car, and very soon got tired of the low tension for the same reason and have fitted high tension (Eisemann). The car was decidedly quieter and most certainly pulls better than it ever has before. Personally, I would never think of having low tension magneto while high tension magneto exists.—Yours truly,

J. H. L. SOAMES.

### THE AUTOMOBILE ASSOCIATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I ask the hospitality of your columns to appeal to the motoring community for contributions in the shape of maps and road books, a compact library of which is urgently needed at our offices, in order to cope with the rapid expansion of our cyclist organisation?

It is hardly necessary to dilate upon the hundred and one reasons why the Automobile Association should henceforth be included in the list of happy recipients of motoring publications "With the author's compliments," and I can promise that all such gifts will be most gratefully acknowledged and used.—Yours truly,

STENSON COOKE.  
Secretary.

## MOTOR QUERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice, in reply to "Silencer" in the *M.C.J.* of the 7th inst., you state that the inlet valve should close at the bottom of the stroke and open immediately the exhaust valve closes. This is incorrect. The inlet valve should close on the compression stroke. Messrs. Panhard set them in their 18-h.p. engine, 100 mm. bore 130 mm. stroke, to open at 2 mm. down on the induction stroke and to close at 10 mm. to 14 mm. up from the bottom of the compression stroke. This is correct and agrees with gas engine practice. I have mentioned this matter before in other journals without getting an opinion from any recognised authority. Would you kindly have the matter considered by a technical expert, as I now deliberately challenge you that you are wrong.

The setting of the inlet valve is, I contend, an absolute fixed position, independent of bore, stroke, piston speed, carburettor, or ignition. We know that an engine will run with wide variations in the setting of the inlet and exhaust valves, and that your opinion is the general one. The object of delaying the closure of the inlet valve until after the compression stroke is chiefly to prevent throttling the passage into the cylinder towards the end of the suction stroke and to take advantage of the acquired momentum of the mixture in the suction pipe. As the crank passes the centre the momentum of the mixture produces a ramming effect and to some extent increases the density of the charge in consequence.—Yours truly,

W. A. B.

## MOTOR-BUS SERVICE

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Several reports have lately appeared in the Press with regard to a projected motor-bus service from London to Romford, but all have been so indefinite that I venture to write and ask if any of your readers know when the service will be inaugurated. There is no doubt that the venture would be a success, as the route traverses so many populous suburban districts, including Seven Kings, Goodmayes, Ilford, and Forest Gate, from all of which passengers would be obtainable to and from the City. Running at reasonable fares such a service would be of undoubted utility.—Yours truly,

ESSEX.

## MOTOR-CARS FOR THE MEDICAL PROFESSION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have pleasure in sending you a photo of my car, which has now been in constant use for eleven months. The vehicle, which is a 14-h.p. worm drive Dennis, is the second I have had during the last three years, and so satisfactory have I found their use that I have

gradually entirely given up three horses I kept previously. As regards cost of running and upkeep, I am not able as yet to make a definite statement, as it is only recently that I have parted with my last horse. The glass screen and Cape hood with which this car is fitted is wonderfully snug in all weathers, and I am kept perfectly dry and comfortable. The man shown in the picture has been my coachman for fifteen years, the last three of which he has acted as my chauffeur.—Yours truly,

W. H. JALLAND, F.R.C.S.

## AN EARLY STEAM MOTOR TRICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am sending you an illustration of an early steam motor tricycle, which you may consider of sufficient interest to reproduce. I came across it in going over some old papers recently. The machine is of French origin, having been designed by a M. L. G. Perreaux, about 1882; as will be seen, it consists of an ordinary tricycle combined with a small steam-engine and boiler. The motor and accessories are supported mainly by the two hind wheels, and the front wheel is used for a driving and steer-

ing wheel. I take the following particulars from the original description:—The steam is produced by the burning vapours of alcohol heating the boilers. The alcohol is warmed to give off its vapour better by means of a little spirit-lamp, whose power can be regulated by hand, so as to increase or diminish the production of heat under the boilers. The steam produced in the boilers is repassed through the spirit-flames in copper tubes, so as to superheat it before it passes into the cylinder of the motor. This adds to the economy of the machine, and there is little or no danger of explosion, as the pressure never exceeds four atmospheres, as can always be seen by referring to the manometer placed in front of the person riding. The motor is a little single-cylinder steam-engine, and its power is communicated to the front wheel by cords and pulleys. Steam is let off under the seat, and water is fed to the boiler by means of a little pump from a reservoir capable of keeping up a three hours' supply before being replenished. The rider has all the stopcocks and apparatus necessary for working the tricycle under his immediate command, and in this way he can traverse the country at a rate of fifteen to twenty miles an hour, with little or no expenditure of his own energy.—Yours truly,

TREMONIA.

## IGNITION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Being the possessor of a somewhat similar car to that which "Forwards" mentioned in a recent issue of the *M.C.J.*, and having experienced somewhat similar troubles, I should strongly advise him, or anyone else using large accumulators, to invest in a Boron charging set. My accumulators are 50 amp. hours. I find they keep in first-class condition by using my six cell set, which I have had in constant use now for over twelve months.—Yours truly,

H. BERRINGER.

THE A.A.—The address of the Automobile Association is 18 Fleet Street, E.C.

MUDGUARDS FOR TRI-CARS.—"Newport" asks for the name of a reliable firm who roll or make mudguards for tri-cars or quads.

REAR LAMP.—A nickel-plated rear lamp was lost on the 6th inst., on the Gloucester to London road. The finder should communicate with G. S. Morden, Brockhampton Park, Andoversford, Glos.

THE ADAMS HEWITT CAR.—A. H. C. writes:—"Might I ask, through your paper, if any of your readers have had any long experience of the "Adams Hewitt" car, and if it has proved satisfactory?"

## AERONAUTICS.

THE judges in connection with the Aero Club Exhibition, held with the Motor-car Show at the Agricultural Hall, Islington, have made the following awards:—Aero Club first prize, Messrs. Short Bros., 6 Saville Street, London, W., for excellence of construction. Medals have also been granted to Messrs. Negretti and Zambra, Messrs. Joseph Levi and Co., M. A. Gaudron, Mr. F. H. Butler, Sir David Salomons, and M. E. Vauden Driepche. Amongst those who paid lengthy visits of inspection to the exhibition were Lord Armstrong, Sir William Goff, Col. Templer (Aldershot), Col. Capper (head of the Balloon Section, Aldershot), Sir Hiram Maxim, Lord Llangattock, Sir Dudley Duckworth King, Bart., and Lord Vaux, of Harrowden, as well as the members of the Aero Club, whose enthusiasm for aeronautics is doing so much for the sport and business.

## CLUBS AND ASSOCIATIONS.

### A.C.G.B.I.

To various committees of the A.C.G.B.I. the following have been appointed chairmen:—Competitions, Col. H. C. L. Holden; Touring, Mr. Henry Edmunds; Expert and Technical, Mr. W. Worby Beaumont; House, Mr. J. F. Ochs.

### ESSEX.

At a committee meeting of the above club, held at the Liverpool Street Hotel, London, on the 4th inst., where there were present Mr. Burnett Tabrum in the chair, Messrs. R. P. Davis, F. S. Hill, R. L. Curtis, J. Gurney Fowler, W. S. Argent and F. Lindus Forge, a letter was received from Mr. G. C. Tijou resigning his position as honorary secretary of the Club owing to ill-health. The committee accepted his resignation with regret, and a hearty vote of thanks was recorded for his services as honorary secretary and sympathy expressed with his illness. It was then proposed by the Chairman and seconded

Mr. J. E. Busch, 7-h.p. Panhard; Mr. R. L. Curtis, 7½-h.p. Wolseley; Mr. E. P. Cayley, 7-h.p. De Dion; Mr. A. H. French, 7-h.p. Panhard. Luncheon was served at the White Hart Hotel, Mr. Burnett Tabrum, chairman of the club committee, presiding, Mr. J. Gurney Fowler proposing "Success to the club," coupling with the toast the name of the chairman. The local arrangements were in the hands of Mr. T. Clarkson.

### THE COVENTRY MOTOR CLUB.

At the annual meeting it was decided to change the title of the Coventry club to the above, and to include drivers of cars as well as motor-cyclists, and also to hold open competitions, for which two cups have already been presented to be won outright. It is hoped that the club will extend. Mr. E. W. Walford, of 18, Hertford Street, Coventry, was elected secretary for the coming year, whilst the existing officers were re-elected and added to as necessary. On Saturday, 31st ult., the opening run was held to Stratford-on-Avon, about twenty members and friends attending. For Easter Sunday and Monday a run has been organised to the Royal Hotel, Droitwich, and some interesting fixtures have been arranged.

### NORTH-EASTERN AUTOMOBILE ASSOCIATION.

The committee of the North-Eastern Automobile Association have made arrangements for the use of a small office for the convenience of the

Touring in France. At the Summit of the Lantoret, Dauphine, 6,860 ft. above sea level.

by Mr. W. S. Argent, that Mr. F. Lindus Forge, 28, Martin's Lane, E.C., be appointed honorary secretary, which was carried unanimously.

The club, which was only formed in November last, now numbers nearly eighty members, several of whom are Justices of the Peace for the county. The opening run took place on Saturday last, meeting at the White Hart, Chelmsford, for lunch, and the following programme has been arranged for the first half of the season, viz.:

- May 5th.—Hill Climb and Brake Test.
- May 27th.—Meet at Dunmow.
- June 9th.—Gymkhana.
- June 23rd.—Meet and Speed Judgment Tests.
- July 8th.—Meet at Maldon.

THE first meeting of the newly-formed Essex County Automobile Club, of which the Earl of Warwick is president, Mr. Wilfred Arkwright, J.P., is the hon. treasurer, and Mr. F. Lindus Forge, of 28, Martin's Lane, Cannon Street, London, E.C., is the hon. secretary, took place on Saturday at Chelmsford, where fifteen members assembled with their cars full of full of guests, the members and cars being as under:—Mr. Burnett Tabrum, J.P., 14-h.p. Wolseley; Mr. J. Gurney Fowler, J.P., 24-h.p. Panhard; Colonel R. P. Davis, J.P., 22-h.p. de Dietrich; Mr. F. Lindus Forge, 14-h.p. Star; Mr. Joseph Mason, Royal Enfield; Mr. W. S. Argent, 18-h.p. Mercedes; Mr. E. Colman, 10-h.p. Talbot; Mr. T. Clarkson, 16-h.p. Chelmsford; Dr. A. Butler-Harris, 15-h.p. Ariel; Mr. Liddle, 7-h.p. Panhard; Mr. R. W. Wakelin, 10-h.p. Panhard;

hon. secretaries of the various districts who may have any clerical work to do, and also for the general use of members desiring information on motor or touring topics. This is situated on the second floor in the Sun Buildings, Collingwood Street, Newcastle-on-Tyne, and will be open to members of the Association between the hours of 9 a.m. and 5 p.m. for five days in the week, and from 9 a.m. to noon on Saturdays. A large scale map of the counties of Northumberland and Durham is kept at the office, and, together with a large amount of other information, will be at the disposal of all members in the district.

### NOTTINGHAMSHIRE.

THE first club meet of the season was held on Saturday last at Ye Olde Belle, Barnby Moor, on the Great North Road. This hotel is under the supervision of one of the members of the club (Mr. Dundas), and a very pleasant afternoon was spent there.

### SOUTHERN.

ON Saturday the Southern Motor Club had its first open hill climb at Coast Hill, Westcott, no fewer than forty-five competitors taking part and the police rendering admirable assistance in keeping a clear course.

C. Patterson on a Daneville motor-bicycle fitted with a 7-8-h.p. Peugeot engine made the fastest time in his class, covering the course, —rather more than half-a-mile—in 43 3-5 sec. R. M. Brice was the winner of the handicap on a 3½-h.p. Brown machine. S. S. Hickson on a

4-h.p. C.I.E. tri-car won the handicap in that section the special club prize going to H. H. Jones, the sports secretary.

### AUTO-CYCLE.

THE Auto-Cycle Club have agreed to the proposal by the other motor-cycle bodies to the alteration of the International Cup race in Austria to July 8th.

The British eliminating trials will probably be run in June, over a private course yet to be decided upon, as the Isle of Man course is not available.

A SEPARATE section for motor-cycling members is being formed in the Hull A.C.

THE Reading and District Motor Cycling Club, of which Mr. L. J. Payne, 96, Basingstoke Road, Reading, is hon. secretary, has held its opening run to Winchester.

### WARNING MOTORISTS.

AT Croydon, William F. Little, of 145, London Road, Norbury, has been summoned for obstructing the police in the execution of their duty on March 4th.

Mr. Muskett, who prosecuted, stated that two constables in plain clothes were on duty in London Road, Norbury, where three spaces of a furlong each had been marked out for the purpose of timing motorists. One of the constables saw the defendant step into the road, and by putting his hands up warn an approaching motorist, who slackened speed at once. The same thing happened with other motorists, and the defendant was told that he would be reported. He replied, "Quite right."

P.C. Harris said that he and P.C. Souter, having stopped one car, took up their position again, and when a motor-car was approaching at a fast rate to one of the lengths, the defendant, who had a newspaper in his hand, went into the road and put his hand up, with the result that the driver at once reduced speed. As the car was passing the witness the driver said something to a man on the path. The rate of the car was more than twenty-one miles an hour, and while the witness was speaking to the driver the defendant signalled to two other cars, which also as a result slowed down. When another car came towards them the witness, who was on his bicycle, saw the defendant hold up his hand, and heard him call out, "Police trap!" The witness then spoke to the defendant, and told him he would be reported for obstructing the police by warning motor drivers of a trap. He replied, "I admit it." P.C. South also said that the defendant stepped in the road and shouted, "Police trap," to motorists.

The defendant said he was in the habit of walking along the road on Sunday morning, and had acted entirely on his own responsibility and out of pure good nature. He was there only about half an hour, and in that time he might have warned twelve to twenty motorists, but his object was not to obstruct the police.

The defendant's advocate said his client had as much right as the police to prevent persons breaking the law. The clerk said the point was—had the defendant prevented the constables executing their duty? In view of the fact that this was a test case, and the first of its kind, the Bench reserved their decision for three weeks.

### MOTORISTS AT MARYLEBONE.

SEVERAL motorists have lately appeared at the Marylebone Police Court, and after fining three drivers £10 each for speeding along the Bayswater Road, Mr. Paul Taylor, the magistrate, remarked that it was necessary to put down scorching in busy thoroughfares, for there were many people who, when they saw a car approaching them at a high rate of speed, got so nervous as not to know to which side of the road to run, and were as likely to run into the car as do anything else.

A motor-bus driver was also summoned for driving at a speed of sixteen and a-half miles an hour along the Maida Vale. In his defence he called an engineer, who stated that the bus was fitted with an automatic governor, which could not be manipulated, and which made it impossible for the vehicle to travel at more than "about twelve miles an hour." Mr. P. Taylor said such evidence was not sufficient to displace the positive testimony of the police, and in fining the defendant £5 and costs he added that many people regarded these huge cars as most terrifying objects. A second motor-bus driver, who was said to have driven on the wrong side of a refuge in the High Road, Kilburn, with the result that a woman had a narrow escape of being run over, was fined £3 and costs, for driving in a manner dangerous to the public.

### A DISMISSAL AT KINGSTON.

MR. ARTHUR CANDLER was summoned at Kingston for driving a motor-bicycle at an illegal speed. Frank Gattrell, park keeper in Richmond Park, estimated the speed at 19½ miles. The Defendant: You have seen me in Richmond Park scores of times?—I have. And you have seen me warning motorists not to exceed the limit?—Well, they go very slow after you pass, I notice. The defendant said he was travelling at less than ten miles an hour, because he was aware of the "trap." The last witness, an old man, could not possibly time correctly, as he could not see far enough on a misty day such as that in question. The summons was dismissed.

### ROAD REPORTS.

LEAMINGTON.—The roads within this borough are in good condition and there is nothing more than a few yards under repair, just by New Cubbington. The practice is to roll down the metal almost as fast as it is put on.

LOWESTOFT.—The roads in this district have had special attention the past year, and are now in as good and satisfactory condition as they have ever been known.

SOUTHPORT.—The whole of the roads in the borough are in very good condition, with the exception of a short length on the main road between Southport and Preston, at Crossens, within the borough but 3½ miles from the Southport Town Hall. At that point the width of the road for a short length of about 280 yards is being doubled. One half of this work has been done, but there is a short length about seventy yards where motorists should proceed carefully, as, although the road is in fair condition, cars will require careful manipulation owing to the quantity of materials about.

BOURNEMOUTH.—The roads in this borough are steam-rolled in construction, and metal is not left loose.

FOLKESTONE.—The main roads in Folkestone (with the exception of a portion of Canterbury Road, which is being widened) are in good condition, and will not be under repair during the Easter holidays.

DROITWICH.—A short section of the main road from Birmingham to Worcester, at a point inside the Droitwich borough boundary immediately south of the Great Western Railway Company's Stoke Branch bridge is in process of being raised so as to improve the gradients

A Juvenile Motorist.

[De Auto.

on the approach to the adjoining bridge over the river Salwarpe, but the road is open to, and quite safe for traffic, the only need being a careful look-out at the spot referred to. Apart from this alteration this main trunk route is in good order. All the other roads in Droitwich are in good condition for motor traffic, as also are all the roads over the fine surrounding country. There is a licensed petrol store, also garage, at the Raven Hotel.

DUST LAYING.—About fifty borough and district councils are now using Akonia for the purpose of dust prevention, and it will also be laid again this year at Newmarket and at Ascot.

### PUBLIC MOTOR SERVICES.

THE G.E.R. motor-buses between Chelmsford and Writtle resumed service on Monday.

A SERVICE of motor-omnibuses commenced between Lowestoft and Southwold on Good Friday.

THE London Standard Motor-bus Company proposes to establish services along popular routes, such as Kensington to the Archway Tavern, via Piccadilly and Tottenham Court Road; Tooting and Streatham to Camden Town, via Clapham Junction and Victoria; and from Hammersmith to the City, via the Strand.

THE London Central Company has been formed to purchase the undertaking of the New London and Suburban Omnibus Company, now running the "Kingsway" service from Chalk Farm to Waterloo, and to open up a service on several new routes.

THE London and North-Western Railway Company have started a motor-vehicle service between Holywell and Mold.

## NEW COMPANIES REGISTERED.

**ARIEL MOTORS** has been registered with a capital of £125,000 to take over the business of the Ariel Motor Company, Limited, of Long Acre, W.C., to acquire the freehold motor works at Selly Oak, Birmingham, to carry on the business of manufacturers of and dealers in Ariel and Ariel-Simplex motor-cars, &c., and to adopt agreements with the Ariel Motor Company, Limited, and Components, Limited.

**STRAKER AND MACCONNEL**.—Registered with a capital of £250,000 to take over the business of automobile engineers and factors carried on by Straker and MacConnel, Limited. The first directors are Messrs. J. MacConnel, W. H. Warlow, H. P. MacConnel, A. Willis, and Sir J. R. Heron-Maxwell, Bart. Registered office, 20, Avonmore Road, Kensington, W.

**VIVINUS MOTOR CARS**.—Capital of £120,000 (£1) to acquire the business of manufacturers of automobiles and motor vehicles carried on at Brussels and elsewhere by Les Ateliers Vivinus Societe Anonyme. The first directors are Comte Jacques de Liedekerke, G. Kerke, A. Vivinus, Sir Thomas Barclay, and J. Gardiner.

**MERCEDES DAIMLER OMNIBUS, LONDON SYNDICATE**.—Capital of £1,000 to become motor-omnibus, van, and cab proprietors, carriers, etc., 1, Broad Street Place, E.C.

**NORFOLK MOTOR TOURING COMPANY**.—Capital of £1,500 to carry on at Great Yarmouth or elsewhere the business of owners of and dealers in automobiles, etc. First directors are Messrs. H. R. Everitt and E. J. Bullard and the offices are at 5, Queen Street, Norwich.

**GEARLESS MOTOR OMNIBUS COMPANY**.—Capital £10. Motor omnibus, van, and cab proprietors and manufacturers, etc. No initial public issue. Registered without articles.

**LONDON STANDARD MOTOR OMNIBUS COMPANY**.—Capital of £250,000 (£1) as title.

## AN ULSTER HILL CLIMB.

FOR the first time since the inception of the Motor Cycle Union of Ireland, the committee of the Ulster centre opened their contests to motor-cars on Saturday. The fixture, a hill-climbing contest, took place at Gilnaberk, co. Down, the programme being divided into two parts—motor-cars and motor-cycles. Judging by the support extended to the venture, the action of the committee found favour with car owners who were present, and it may be expected that the future competitions under the same auspices will include the larger vehicle. The afternoon was fine and the attendance good.

The result was as follows:—

## MOTOR-CARS.

T. Dunlop, 5-h.p. Peugeot...	1 min. 33 2-5 sec.	1.
W. McCammond, 15-h.p. Darracq	1 " 39 1-5 "	2.
J. S. Garrett, 8-h.p. Rover...	1 " 42 2-5 "	3.
T. Clapham, 5-h.p. Cottrean	1 " 44 2-5 "	4.
S. P. Corry, 10-h.p. Humber	1 " 51 "	5.
J. B. Ferguson, 10-h.p. Speedwell...	1 " 51 3-5 "	6.
W. H. Green, 8-h.p. Rover	2 " 10 "	7.

## MOTOR-CYCLES.

A. Parker, 2½-h.p. Minerva	1 min. 15 2-5 sec.	1.
H. Ferguson, 3½-h.p. Riely	1 " 41 1-5 "	2.
C. Rey, 3½-h.p. Minerva	1 " 51 1-5 "	3.
J. Stewart, 3-h.p. Triumph	1 " 15 2-5 "	4.
H. A. Connell, 3½-h.p. Minerva	1 " 15 2-5 "	5.
L. Craig, 2½-h.p. Minerva	1 " 34 "	6.
A. Bullock, 2½-h.p. Rand. P.	1 " 41 "	7.
A. W. Hamilton, 3½-h.p. Ormonde	1 " 25 "	8.

## MOTOR-CAR MISHAPS.

AN inquest was held at Wansford on Saturday on the body of William Miles, aged 51, an organ builder, who was killed by a motor-car on the Great North Road on Friday. Frederick Hudson said that he walked with the deceased from the casual ward at Peterborough on Friday. After passing Wansford he called Miles's attention to the approach of the motor-car, and he said he would go to the other side of the road out of the dust. Miles did not cross the road then, but as the car came up he seemed to walk deliberately into it, though the driver sounded his horn, and tried to avoid him. The car was travelling at a speed of about twenty miles per hour. Mr. Nicholas Wood, of Aldwych Mansions, London, the owner of the car, said that he tried hard to avoid the man, who stopped in front of the car when it was only about fifteen yards away, but the wheel struck him. The jury returned a verdict of accidental death.

EMMA LAWRENCE, 74, was crossing Kennington Road near Brook Street, S.W., some distance in front of an electric car going to Westminster. She cleared the tram, and appeared at first not to notice a motor-car which was coming along. As soon as she saw its approach, however, she stopped, hesitated, and then stepped back. The motor-car driver, in trying to avoid her, turned sharply to his off-side, and in doing so ran into the tram. The car struck deceased with its rear side and ran over her. She died at St. Thomas's Hospital. In summing up at the inquest the Coroner said that it was still lawful for old ladies to walk about the street. Her conduct might be foolish in hesitating about her movements, but that did not affect the responsi-

bility of the motor-car driver. The motor-car driver made an absurd statement in saying that the tram ran into the motor-car, for the tram could not leave its track. The sounding of a horn was a questionable matter; it might be good as a warning, or it might do harm by frightening a pedestrian. The motor driver did not appear to have done all that was possible. The jury returned a verdict of "Accidental death."

## NOTIFICATION OF CHANGE OF ADDRESS.

AT Woolwich, a motorist, Samuel Whitfield Thackeray, of the Fish and Eels Hotel, Royden, Essex, was summoned before Mr. Kettle for failing to register his change of address as owner of car No. A 8,608. The police evidence was that the defendant had removed from 72, M'Leod Road, Abbey Wood, to Royden. A London County Council registration officer said that the defendant, when notified of the matter, replied expressing regret that he had not given notice. The defendant contended that he lived at both addresses. He was the owner of the house at Abbey Wood. Mr. Kettle imposed a fine of 10s., and costs 3s.

## APPEAL ALLOWED.

AT the Gloucester Quarter Sessions, Ernest Robinson Thorne, chauffeur, to the Rev. L. E. Mackinder, vicar of Wotton-under-Edge, appealed against a conviction by the justices of Chipping Sodbury, under which he was sentenced to three months' hard labour for driving, as alleged, a motor-car at a speed which was dangerous to the public. The chairman said they had come to the conclusion that the appeal must be allowed, on the ground that there had not been proper service of the summons. They made no order as to costs.

## APPEALS DISMISSED.

BEFORE Mr. Loveland, K.C., and other justices sitting at the Clerkenwell Sessions, on Friday of last week, Arthur Rainsdon, a chauffeur, in the service of Sir Gerald Hanson, of Cleveland Square, W., appealed against a fine of £10, for that he on February 2nd did unlawfully drive a motor-car in a manner dangerous to the public. Two policemen alleged that the appellant was drunk on the night of February 2nd, and that he drove a motor-brougham, which had no lights, rapidly in Jernyn Street, W., and nearly collided with the cabs on the rank. Rainsdon denied the allegations, but the Bench dismissed the appeal, and affirmed the magistrate's decision with costs.

AT the Surrey Quarter Sessions on Friday of last week Earl Russell appeared in support of an appeal by himself against a conviction by the Kingston justices under the Motor Car Act. It was stated by Superintendent Marks, of the Surrey Constabulary, that his lordship was convicted on February 26th for driving at twenty-eight miles an hour at Cobham, and that he had been three times convicted previously. His lordship urged that as the object of the Act was to safeguard the public and it was not shown that he had been driving to the danger of the public, the fine of £15 was excessive. The magistrates said they must take notice of the previous convictions and they dismissed the appeal.

## POLICE TRAP.

NEWPORT.—The now well-known measured half-mile of road at Coedkernew, near Newport (Mon.), has proved a trap for several more unsuspecting motorists, who were summoned before the Newport county magistrates on Saturday to answer charges of driving beyond the legal limit.

## CASES AGAINST MOTORISTS.

Place.	Summoned for	Result.
Lanark ...	Reckless driving	£5, etc.
Birkenhead...	Furious driving	Dismissed.
Westminster	Dangerous driving	40s., etc.
Croydon ...	Driving to common danger	£4.
Lincoln ...	Furious driving	10s., etc.
Bradford ...	No rear light	20s., etc.
" ...	Failing to stop when requested	£5, etc.
Newcastle ..	Reckless driving	£10, etc.
Northampton	No rear light	Withdrawn on payment of costs.
Lincoln ...	Furious driving	10s., etc.
Cardiff ...	Dangerous driving	Dismissed.
Hurst Green	Reckless driving	£10, etc.
Newport ...	Several charges of furious driving	£10, etc.
West London	Exceeding legal limit	£5, etc.

ON Easter Monday, C. R. Collier and G. A. Barnes will have a one hour motor-cycle race on the Canning Town track

# THE Motor-Car Journal.

## COMMENTS.

THE sad accident on the Ripley road on Good Friday, by which a lady, thrown to the ground by the overturning of a trailer, was run over by a motor-car, suggests a question as to the whereabouts of the police. Instead of regulating the traffic at an awkward corner some of them were probably disguised and hiding behind hedges in order to catch motorists. As Lord Westbury told the coroner, "for the safety of the public on holidays the police would be much better employed in being stationed at dangerous places instead of lying in ambush to catch motorists going a little bit too fast." Two or three cases have come to our notice this Easter which show very clearly how the public interests are neglected, while the police seem mainly concerned with the capture of motorists. The Hon. Stephen Coleridge told one bench of magistrates that the Act under which he was summoned was for the protection of the public, and was not intended to be an instrument for collecting large sums of money from innocent wayfarers. Such plain speaking is necessary, and we are glad to learn that the magistrates in some parts of the country are objecting to the methods of the police in their display of hostility to motoring and motorists. Certainly they might be more usefully employed at holiday seasons in regulating traffic in busy places than in secreting themselves from public view.

### Home Defence.

SIR CONAN DOYLE'S motoring enthusiasm is well known, and anything from the motor-bicycle to the largest type of automobile is familiar mechanism to this novelist and politician. But it would have been well had his latest proposal for the utilisation of motor-cars in connection with coast defence been made in conjunction with the Motor Volunteer Corps. Lieut.-Col. Mayhew and those who are under his command have already made great sacrifices for the military authorities, and before pledging themselves to the support of the latest plan motorists should await the judgment of those already organised for a purpose not wholly out of line with the object desired by Sir Conan Doyle.

### The Dust Nuisance.

WITH the fine weather of Easter the dust nuisance has been revived, and residents on the main roads have found clouds of road surface giving a new colouring to green hedgerows and well-trimmed lawns. In the papers medical men have been attributing sore throats to the motor-car and its stirring of the dust, while county authorities have been bewailing the evil, which is one of almost universal extent. On the Bath road the experiments with tarred macadam have mitigated the nuisance somewhat, but in Brentford, Hounslow, Bagshot, Guildford and other southern towns of popular resort, the dust has come along in volumes as of yore. It would be interesting if readers would report their experience of some of the expedients that have been devised to deal with the matter. At Finchley and also at Romford trials of akonia are being made;

between Taplow and Maidenhead tarmac is the favoured material; at Ripley tar is being used as a coating for the road surface, and at Tonbridge similar experiments are being carried out. But the truth remains that scores of local bodies have yet to be awakened to a sense of their responsibility in making the roads tolerable.

### The South Herts Club.

WITHIN a short distance of the ancient Harold's Bridge and the famous Abbey of Waltham the South Herts Automobile Club have held their opening meet. This new organisation has its headquarters at the Falcon Hotel, Waltham Cross. A busy programme has been arranged, and a capital trip was made to Brighton and the south coast at Easter. On the last Saturday of the present month a joint meet will be held with the Essex Motor Club at High Beech—a district which is practically foreign land to many motorists on the south side of the Thames, but which has many natural delights, and is a place well worthy the run, save, perhaps, on Bank Holidays.

### Colonial Motor Volunteers.

ATTEMPTS are being made to introduce the motor-car and the motor-cycle into the military service of the Australian Commonwealth, and the Minister for Defence has promised to have the proposal inquired into. The motor-bicycle having found a certain amount of favour with the Army Council in England has given new life to the idea, and a suggestion has been made that they should be used for despatch carrying in Australia. Owners of motor-cars are joining in the movement, and the proposal made to the Minister takes the definite shape of an automobile corps, which shall provide cars for service with artillery and cyclists to carry messages. In Australia the utility of the machines has been demonstrated more than once. During a staff ride in Tasmania two years ago a civilian with a motor-cycle rendered excellent service to General Hutton and his staff over the well-made roads in the midlands, and again in September of last year Captain Arnott, with his motor-car, made a similar military exercise in the vicinity of Windsor. Hence the favour with which the matter is being considered by the Colonial Ministry of Defence.

### Wind and Dust Shields.

SEVERAL new wind shields have lately made their appearance, and should the weather of last week continue for any length of time, there will be a number of dust screens coming into view to shelter the occupants of rear seats from those particles of the road that have capacity for leaving the surface. Many are deterred from the use of the wind shield owing to the presence of glass being regarded as a source of danger, as it doubtless would be were public anger to find vent in stones or other missiles. But, on the other hand, it must be remembered that hundreds of such devices are in daily service, and, so far, we have not heard of any serious risks being run. Screens composed of other material have their advocates and traducers, while that in which glass is combined with some other transparent material has not yet become a common object of the

car. There is, however, an important field of investigation in this department of the automobile, and consideration must also be paid to the distance of the screen from the occupants of the front seat. Devices are now being introduced in which an attempt has been made to have regard to this aspect of the matter, and the practical experiences of motorists should afford the groundwork upon which to promulgate the conditions essential to the success of such a necessary adjunct to the modern car.

### Journalism and Motorism.

IN connection with the recent international football match at Glasgow the motor-car played a prominent part in the supply of "copy" to one of the local evening papers. Great rivalry prevails amongst those journals, and competition is at its keenest on the occasion of an important football match. The "Evening Times," with characteristic enterprise, engaged three Argyll cars, and by this means they were enabled to cover the three miles between the scene of the match and the printing office in a minimum period. The cars were kept busy all the time of the match, and the paper was in the streets with a full account of the day's proceedings before the bulk of the hundred thousand spectators had returned to the city. This

Mr. Frank Butler and Mr. C. Spencer with their exhibit in the Aero Section of the Cordingley Show.

is not the first time that the automobile has thus been employed in journalism, our French contemporaries often utilising its services. It has also proved its value in the distribution of journals, as well as the despatch of copy; in fact, it is becoming ubiquitous in the newspaper world.

### Examinations.

ALTHOUGH we would not place too much emphasis on the value of a paper examination in connection with mechanical matters, the scheme of testing which is now being developed must have a good effect on the calibre of the motor-driver of the future. In view of the examinations officially conducted in various parts of this country special interest attaches to the questions for the "engineman" which have been set at an official examination in New York. "Automobile engineman" is the official title given to its chauffeurs by the City of New York. The successful candidates for a vacancy in the municipal motor service were selected from a list of applicants who were previously given an opportunity to display their knowledge of automobiles on paper. The examination was divided into three heads:—Experience, arithmetic, and technical knowledge—a percentage of seventy-five being required on the last named, and an average of seventy on all. The mathematical knowledge

required was of the most rudimentary order, not going as far as the rule-of-three; while the "experience" consisted in filling-in a blank accompanying the application and showing the would-be city-chauffeur's actual career behind the wheel. The technical paper is given on another page.

### The Right View.

ON this subject of the examination of motorists the writer of "Motor Notes" in the "Free Lance" quotes the view recently expressed in these columns as to giving the Club credit for its efforts to satisfactorily fulfil its self-imposed task, but suggesting that some authority of a more national character will ultimately be required. Our contemporary adds:—"The M.C.J. is undoubtedly right. After all is said, the Club is really a private body, and no private body can possess all the qualifications requisite to deal adequately with a problem of such dimensions that the Club itself will be compelled to recognise the advisability of seeking relief from its self-imposed responsibility. In the meantime the Club ought certainly to thoroughly overhaul the question of fees, and we are much gratified to find that our views are shared by so powerful a factor in motor politics as the *Motor-Car Journal*."

### Motor-Bus Driving.

SOME figures which Mr. Herbert Gladstone has given in the House of Commons in reply to Mr. Galloway Weir, emphasise the trend of our article last week on the motor-bus movement. During January the number of accidents in which motor-buses figured was 211; this advanced to 235 in February, and rose to 331 last month. Of course, we recognise that the majority of these were slight, and that the number of really serious cases was small, but the accidents which have followed the introduction of motor-buses in large numbers will, unless prevented in the near future, lead to some restrictive legislation not at all pleasing to the advocates of motorism. Hence the need for the managers of the motor-bus services severely warning their drivers to keep clear of anything which savours of racing—one of the most fruitful sources of trouble in the old days of omnibus rivalry.

### In the Wye Valley.

THE beautiful valley of the Wye is a delightful motoring country, and the roads on Monday and Tuesday were in perfect condition, cars passing through Chepstow, Tintern, Ross and the other prominent places on the landscape in an almost continuous stream. At the Beaufort Hotel, opposite the lovely ruins of the Abbey at Tintern, scores of cars were garaged during the day, while their passengers explored the beauties of the district. The sleepy old town of Hereford, too, was aroused by the rushing of cars and the blowing of horns, while variety was given to the automobile demonstrations in the Wye valley by a balloon ascent from ancient Monmouth, when Mr. Frank H. Butler was accompanied by the Hon. C. S. Rolls, Professor Huntingdon and Mr. John Holder. There was a dead calm, and so still was the air that two hours elapsed ere the balloon, at a height of 1,000 ft., disappeared behind a neighbouring hill.

### The Tyre Trials.

WITH commendable promptitude the A.C.G.B.I. has made known the awards in their Tyre Trials, and the Collier Tyre Co., Ltd., are to be congratulated on the uniform running of their entries. Gold medals have been awarded to the entries in the three classes, the 36 in. and 34 in. having made non-stop runs on 22 days, and the 815 mm. on 23 days. Although we cannot publish the actual times, readers can be assured that the average mileage was up to the legal limit, and the condition of the tyres at the conclusion of the run left no room for doubt as to the winners of the gold medals. The fact that no other tyres were entered does not detract from the value of this testimony,

to the excellence of the Collier tyres, the makers of which showed considerable spirit and enterprise in subjecting their productions to the test.

### Mr. Jarrott's Journey.

THE splendid run made by Mr. C. Jarrott, on his 40-h.p. Crossley car, recorded last week, has given Mr. Filson Young opportunity for some picturesque prose in the "Tribune." Their thoughts were with the car, "observing its sounds and its behaviour, listening to the song of the engine, and watching the play of the springs and mechanisms upon which depended our safety and success." On French soil there came a hard run through a pitiless rainy night into a bright morning. "Some magic had happened in the night and the day; we were no longer in the north, but in the south; new smells came up from the gardens and the vineyards, a new living green began to live and glimmer in the foliage. It was at Avignon that I first realised we were in another world—Avignon with its mighty walls and deserted palaces, its space and mellowness, its splendour and its ruin."

districts—if sellers would endeavour to get into touch with those whose business requires fairly rapid transit without too much regard to appearance.

### A Silencer Competition.

SERIOUSLY would we impress upon the authorities connected with automobilism the necessity of carefully planning their competitions before actually announcing them to the public. Otherwise a continuation of the difficulties associated with recent events of the kind will considerably irritate those in a position to help them to a useful conclusion. Just now the Auto-Cycle Club is soliciting entries for a silencer competition. We understand that the sub-committee that has the matter in hand has decided to purchase a 3½-h.p. water-cooled engine running at a speed of 1,500 r.p.m., and with an outside flywheel if possible. This engine will be fitted up in some testing shop, and in arriving at their decision on the silencers the judges will be asked to consider several points, including back pressure, noise, facility of attachment, weight and strength, capacity, means of cleaning, and maintenance and cost.

The Milan-San Remo Light Car Trial, the best time in which was made on a Marchand Car.

### Where Old Cars are Wanted.

THROUGHOUT the country motor-bus services are being developed, and although the volume of progress has, of course, been most pronounced in and about the Metropolis, Easter tours have resulted in the discovery of several services of which little had previously been heard. A journey in the West of England has led us to again emphasize the necessity of those who run public services, whether of 'buses or of cars, keeping to a scheduled time-table, which should be made public by prominent advertisement, so that those who journey may read, otherwise much expensive effort may be lost. Another point that has been brought out is the long life of some of the earlier cars that have long been discarded by the fashionable motorist, but are now doing useful service in station and hotel work. Even the tube ignition is not wholly obsolete, and at Cheddar finds daily demonstration, where a railway company's steam 'buses have already ceased to compete. Such little experiences are interesting and suggest something to arrest the too grievous depreciation of cars that takes place when finding new owners for cars. There is a demand for such in rural

### Joint Meets.

ON the last Saturday in this month there will be an important joint meet of automobile clubs at Ashby-de-la-Zouch. Half a dozen useful and influential motor organisations in the provinces have already notified their intention of being present, and only fine weather is now required to give great importance to the event. The clubs which are mainly interested in the meet are those of Leicestershire, Nottinghamshire, Wolverhampton, Dorbyshire, Northamptonshire, and the Midlands.

### Alleged Police Bungling.

SOME proceedings that have just taken place in the Stratford Police Court will do much to vitiate the reputation of the police of that district. True the victims were not motorists. They were ordinary cyclists, who, seeing the police were arguing with other cyclists, got off their machines to ascertain the cause of the controversy. For their curiosity they were marched to the police station and subsequently charged with riding to the common danger. In discharging the defendants, Mr. Carter,

the chairman of the Bench, pointed out that there was a discrepancy between the police evidence, and added that the opinion of the Bench was that the police thought they "would have someone," and therefore took the prisoners into the station. This desire to "have some one" is not only developed for the annoyance of cyclists; it may be at the root of much of the antipathy to motorists.

#### Garage Management.

THE management of motor garages is an important matter involving almost as much personal attention as farming. Proprietors who can give their own personal attention to all the details are, in some respects, fortunate; those who have managers in charge of their establishments who are prepared to regard the business interests of the owner as identical with their own are to be congratulated. A certain firm, which shall be nameless, but which has a somewhat extended reputation, recently advertised for someone to look after a new garage that they were opening in a town somewhat distant from their headquarters. They offered him a salary hardly averaging fifteen shillings a week, but which, supplemented by commission, might reach an amount equivalent to, after deducting £25 per year to be charged for rent of his apartments, a few pence more than three pounds a week. In favouring applicants for the post with these details, the firm also inserted a list of fourteen interrogatories, one of which was, "Are you willing to deposit £500 as guarantee?" Our readers can form their own opinions of such generosity, remembering that the manager will be required "to live on the premises, which are to be always open, so that a customer, by ringing a bell any time during the night, or on Sundays, can be attended to," and "to sign an agreement not to start in business, either for himself or anyone else, within twenty-five miles of our districts for a period of ten years from the date of leaving our service."

#### Canals as Motor Roads.

OWING, in great measure, to the action of the railway companies, our canals have been robbed of much of their usefulness, and neglected waterways, combined with exorbitant rates, have led to a grievous state of things in this respect. In many places the railways have a practical monopoly of traffic and can charge whatsoever they please. But, just as the passenger carrying motor vehicle is tending towards reduction of fares on railway lines with which it threatens competition, so the advent of the heavy lorry and the vehicle conveying tons of merchandise will ultimately have an effect on railway rates. Now that a Royal Commission is sitting on the subject of the canals seems an opportune moment for reviving a suggestion that the canals should be turned into tracks for motor vehicular traffic—not for passengers, but for the transport of goods. Whether there is sufficient commercial vitality in the idea to give it value we know not; but when the Commission is considering its suggestions this proposal might well be renewed. It is, at least, feasible; whether profitable, not even the expert can venture to affirm with any show of assurance.

#### Commissions

BOTH trade and amateur motorists will regard with favour any legislation likely to effectually stamp out the system of giving commissions to servants. Recently the Courts have revealed that the practice has crept into the automobile world, and that chauffeurs are sometimes in the habit of suggesting the advisability of presents being given them if orders are to be obtained. Business conducted on such a flimsy basis can never be really satisfactory, and we were glad to learn from conversation with several leading firms at the Show that they are endeavouring to discountenance the system as far as lies in their power.

#### Inland Revenue and Definition.

THE Board of Inland Revenue are now engaged in giving consideration to a point raised by Mr. D. Leechman in connection with the definition of a motor-car, and they are so appreciative of that gentleman's gratuitous services as to officially "express their thanks" to him "for calling attention to the matter." What it was is best described in his own letter to the Board, which read as follows:—"With reference to Inland Revenue Form 132, declaration for establishment, motor, and dog licences, in defining the term 'motor' it is stated that the duties charged include those payable on a light locomotive as defined by the Locomotives on Highways Act, 1896 (59-60 Vict. Cap. 36). A motor that weighs not more than one ton or upwards of five tons, unladen, is not a light locomotive within the meaning of the Act. While agreeing that, as a rule, motor-vehicles weighing upwards of five tons, unladen, are not light locomotives within the Act of 1896, I am not aware that a motor-car weighing not more than one ton is also outside the definition referred to, and I shall be obliged if you will kindly favour me with your authority for this assertion. If it be correct, the inclusion of motors weighing, unladen, not more than one ton, under heading Carriages (b) (i) (3), on page 1 of the form, is an error, and the appended duty of £2 2s. is not payable thereon."

#### Canadian Regulations.

CANADIANS have been worried by occasional American invasions. Motorists have rushed down into the eastern townships of Quebec from the American frontier in order to speed along the highways, utterly regardless of the convenience or safety of those who use the highway in a fair and proper way. To circumvent these outrageous proceedings a new law is now being enforced by which owners of cars who do not reside in the Dominion are required to furnish a satisfactory bond to the Provincial Treasurer for the sum of £100 as security for any damage that may be caused by them in operating their motor-cars in the province of Quebec. So much for the regulation with regard to strangers within the territories of Canada; but the new law also regulates the speed of all users of automobiles to six miles per hour for cities and towns, and fifteen miles for the open country. When approaching sharp turns, bridges, steep descents, and the like, the pace must be reduced to four miles per hour. Altogether the new law in Quebec is one of severity, consequent—be it remembered by every British motorist—on the inconsiderate driving of a minority of the owners of cars.

AMONG the new M.P.'s who seem to be interested in motor car questions, Mr. Fell, the representative of Yarmouth, has been noticeably active.

A TALBOT 12-16-h.p. four-cylinder car, with three persons up, was successfully driven up the steep ascent known as Netherall Gardens, N.W., on the third speed one day last week.

THE Harrogate Corporation, whose application for a ten miles per hour speed limit in certain streets was referred to last week, describes those "narrow and dangerous streets" as "broad and level and of easy gradient" in its official guide book.

THE British Automobile Commercial Syndicate, Ltd., have just issued a new catalogue of the dustless Spyker cars. It gives particulars and illustrations of the various sizes of these well-known vehicles, and also of the leading components. An article on "How to Drive the Spyker Car," by Mr. F. F. Wellington, forms a useful appendix to a noteworthy production.

VISITING Hastings during the holidays, we made use of the Central Motor Works and Garage in Queen's Road, and found them well adapted to meet the requirements of motorists. Accumulators can be quickly recharged, tyres can be vulcanised on the premises, while a somewhat novel form of daylight inspection pit is available. Mr. E. Stally, the proprietor, is the local official repairer to the A.C.G.B.I.

## A RECORD OF PROGRESS.\*

OCCUPYING a unique place on the bookshelf of the motorist, the Motor Year Book unfortunately arrives just as the enthusiast has arisen from his winter sloth and is prepared to travel long distances away from books and newspapers, only caring to scan—may we say it with due humility—those journals that assist his progress on the way. Truth to tell, the book should be issued not later than February. Had it come along when evenings were longer, its excellent features would have found universal appreciation. Our criticism is, however, immaterial so far as the quality of the work itself is concerned.

As has already been said, it has no rival, being neither over-weighted with ponderous technical chapters nor laden with dull statistics. It forms a really comprehensive and readable retrospect of all branches of motoring activity during the past year. The plan adopted by Mr. Massac Buist, who has been responsible for the work, has been to range about him a group of writers each of whom treats of a division of the subject with which he is specially competent to deal. "To ensure sincerity on the part of the writers," says the editor, with a keen insight into the weakness of human nature, "all contributions have been signed, nor have any pen-names been adopted." That, however, does

attached, whilst my companion was assisting by holding the handle-bars. As we got level with the driver of the cart I jokingly remarked, "Isn't that a fine horse I've got, Pat?" "It's not bad for an ass," was the reply. My friend and I had a discussion as to which of us was so pointedly referred to, but I think the meaning was obvious."

The part of the Year Book dealing with the competitive and sporting element of motorism has a trio of authors who have followed the matter from various points of view. Mr. Buist chronicles the progress of the Gordon Bennett race, perpetuating the erroneous hyphen as though the donor of the famous trophy had a double-barrelled name, and revels in the tabular records which he prepares with such assiduity and accuracy. Mr. T. H. Woollen's impressions of a timekeeper have historic as well as current interest, for that gentleman has retired from the tent of the official and is now a distinguished member of the industry. His vivid descriptions of some famous races are a good bit of journalism, while the opinions recorded as to the systems of timing in vogue have practical value:—

The Blackpool speed trials, from a timekeeper's point of view, were worked without a hitch of any kind. Immediately before the events for racing cars I had all the chronographs synchronized, and checked at the finish, and am confident that no races have ever been timed with greater accuracy. At the Blackpool meeting W. Clifford Earp tied the world's record for the flying kilometre, and he can rest assured that no one has ever been more keenly or accurately timed. Six watches were held on him—three at the start and three at the finish—and there, was not

The above illustrations depict the first Austin car leaving the works at Northfield, Birmingham, on the 7th inst. The car is fitted with a 25-30-h.p. four-cylinder engine, and is chain-driven.

not prevent one contributor locating the Agricultural Hall (page 75) in Kensington.

The introductory chapters on motoring in England, Wales, Scotland and Ireland are contributed by Lord Montagu, Sir J. H. A. Macdonald, Bart., and Mr. R. J. McCreedy, each displaying his distinct nationality in the pages under his name. We select a quotation from the latter's article:—

A typical Irishman is at heart conservative, strange as it may appear, and is consequently hard to move, especially when the movement is of a very radical nature. For this reason the motor-car was at first very slow in making its way in the country, and my earliest efforts in automobilism were mainly evangelical. They were focussed on endeavouring to persuade the public that motor-cars would "mote," and might be relied upon to bring their owners home with some degree of certainty. Though I have mentioned that the Irish are slow to take up a new idea, they are instant in repartee, and the man who tries to "take them on" generally gets more than he bargains for. As a case in point, I remember we were descending a long hill in Kerry, when we came on an old woman standing open-mouthed by the roadside. My fellow-tourist pulled up at once, and, with the object of having a joke at the old lady's expense, said, "I beg your pardon, ma'am, but did you see two horses on in front?" "No, sir," was the prompt reply; "it's asses drives thim yokes." I had another example of this trait in the Celtic character only last week, but under different circumstances. I had gone mountain-climbing on a tandem push bicycle, and while walking a very severe pass overtook a cart. At the time I was pulling the tandem with a rope

the slightest variation at either end. I do not believe in the old system of keeping the watch out of sight and asking the other officials to take one's reading of the same for granted. My three Stauffer split-seconds chronographs are fitted in one case, and I always place the same on a table where my colleagues can see and read them if they wish. An expert timekeeper holding a reliable chronograph has nothing to hide away—he is simply there to time the duration of an event and he ought to have no further interest in that event—he should be *sans peur et sans reproche*. On the invitation of the joint committee of the Automobile Club of Great Britain and Ireland and Motor Union, I timed the London traffic at many points for the Royal Commission. The system I adopted was to chain out 110 yards, standing at the starting point, and taking the finish from a signal given by my colleague. This method is directly opposite to that adopted in working police traps, and the difference is this. By my method, any delay in signalling the finish, or in seeing the signal, lengthens the time; whereas the police method shortens the time, because the officer does not start his watch until he sees the signal. By that time the car may have travelled a considerable distance, sufficient, in fact, to put the speed outside the legal limit, although the driver may be quite conscious that he is passing through the trap well inside twenty miles an hour.

Of the first hundred pages of the work the one that will occasion most surprise is written by Mr. Charles Jarrott, who records the feelings of the spectator. This from a winner of the Circuit des Ardennes race in 1902 and one of the British team in the Irish Gordon Bennett contest seems strange, but full of interest withal. We remember his tussle with Gabriel in the Ardennes, emulated by Heath and Teste two years later, and his criticism of the driving of others has therefore a value

\* "The Motor Year Book and Automobilist's Annual, 1906," edited by H. Massac Buist. London: Methuen and Co., 7s. 6d. net.

beyond that of the dilettante who writes without having felt the thrill of the gladiator.

When Thery gained his place in the French team for the Gordon Bennett race, I saw how his dogged perseverance carried him home a victor, and never shall I forget the meteoric and brilliant driving of Wagner in the same race in his splendid attempt to place his Darracq in front. Lancia's driving in the Gordon Bennett race, his look of triumph as he passed Thery, and the philosophy of the latter as he started off in pursuit, I would not have missed for a great deal of money, and I thanked fortune for placing me at the particular place of Thery's stoppage at that particular moment. Later on, in the Circuit des Ardennes, Hemery was another revelation. Consummate skill with splendid devilry secured him a magnificent victory. It was worth travelling a long way to witness all this, and how I should have regretted had I not been there. It was all so novel—new impressions and new ideas. I saw the game under a different aspect—as a spectator instead of a competitor—and I appreciated it as few other spectators could appreciate it. And what were my impressions? Firstly, of speed. Have you stood at the bottom of a long slope when a mass of metal, steered, controlled, and directed by human hands, has hurtled by at 90 miles an hour? Has it not appalled you? Did you not wonder how it was possible that such a struggle between machine and man could go on for hours without disaster, and with the ultimate victory of the man over machine? All this I marvelled at. It seemed incredible and impossible, and yet I knew from my own experience that the man on the car was coolly noting each varying circumstance of the road and car, physically feeling but little strain, and eager to travel faster and faster towards the

Motoring in Mexico on a White Steam Car.—A Halt by the Wayside

distant finish, not the least bit appalled, but enjoying the fight as only an expert can enjoy it. That hair-raising skidding at the corners, so horribly dangerous as it looked, was done deliberately, and was calculated to a nicety. The appearance of the car as it dropped down hill, with the front wheels apparently swaying in mid-air, was merely usual, and all quite ordinary to the man on the car; but how horrifying it look from the spectator's position.

Of considerable value are the succeeding chapters dealing with technical matters, and the editor's own observations of the trend of mechanical tendencies are followed by an ample review of petrol car development by Mr. Anthony C. New, in the course of which he says:—

Turning one's attention to a consideration of the actual progress that has been made in the year that has just gone, it is hardly too much to say that improvements in materials easily heads the list. None except manufacturers themselves, or those who have been in close touch with them, can have any idea as to all that this means in motor-car construction. It is not merely that weight can be reduced by using metals that have greater strength, nor are the improvements referred to only those that provide the manufacturer with a more useful raw material with which to work. Special steels are available to-day which enable him to run all his machine tools at a far greater rate of speed than has been possible formerly, and he has also been able to acquire the services of men who have made a life-study of steel production to show him how it should be treated at each stage of the work. In this matter alone

the saving of cost, through reduction of time and labour, has been very great indeed, and the proper treatment of the various parts, in the way of annealing and hardening, has added enormously to their useful qualities. The knowledge as to precisely what grade of steel should be used for any individual part of the mechanism is not to be acquired by any car constructor without considerable study; but when, added to this, different grades require different treatment to render them most suitable for the exact nature of the work that they will be called upon to perform, the chances of any one man becoming thoroughly *au fait* with this subject as well as with car design and quantity production become less and less as time goes on.

Turning to the more technical portions of the work, completeness is again apparent in the pages devoted to constructional detail, in which the car, the coachwork, wheels, and tyres all find a place, the chapter on the latter being by Mr. J. Ernest Hutton, who frankly doubts whether motor tyres have improved during the past season. He points out that they still figure as the most expensive item in car maintenance, costing, perhaps, five or six times what the fuel costs per mile run. The fact is that the machinery has developed faster than the tyre, builders increasing the horse-power and speed of their vehicles until the makers of tyres have been left behind in the race. A good word is said for the non-skid, which will, in Mr. Hutton's opinion, be the salvation of the pneumatic tyre pending the introduction of a resilient and satisfactory solid tyre.

Part IV. deals with commercial motors, and the first chapter is described as "touching certain commercial aspects," under which Mr. S. F. Edge, with characteristic modesty, says, "One of the most striking successes of British design has been the six-cylinder motor, originally introduced in the Napier some years ago." The writer finds, on looking into the imports of Great Britain, that things are going well with the English industry. That may be taken for granted, and there is no need to exaggerate the advance, at the same time minimising the importance of the business of the Continent. Facts are facts, and cannot be wholly obscured by the superlative tone in which the exaltation of the British progress is proclaimed. The writers on the heavy and light commercial motor vehicles now in use are on more solid ground, and redeem the rather inconsequential introduction to that section.

The one lady writer finds a place in the part dealing with touring and roads, and Mrs. Edward Manville's account of south-east England should suggest an even more extended tour for the purpose of next year's volume. In this connection the problem of the roads is naturally mentioned as a matter presenting difficulty. Mr. Buist accounts for this complexity as follows:—

The problem of the roads, however, is not so easy of solution. This is to be accounted for by a variety of reasons, the foremost of which is that the science of successful road-building would appear, for some unexplained reason, to have been allowed to lapse since the establishment of our great railway systems. Until quite lately the badgered motorist was usually able to temporarily silence his hecklers by pointing out that the soft-tyred motor vehicle in nowise causes injury to the surface of our highways, but merely raises such loose material as the pounding of the iron-shod hoofs of horses provide, leaving it in the form of wisps and even clouds of dust by the mere suction of air in passage. Now, however, sportsmen are glad that the trouble can be traced yet a stage further, and transferred from our four-legged dumb friends to the engineers who are entrusted with the task of building our highroads. They have abandoned the principles of such men as McAdam in certain fundamentally important matters, as, for instance, in the necessity of having the stones broken to an even size, and never exceeding six ounces in weight, but preferably of an ounce apiece or about an inch in diameter.

In summarising the legal position of the motorist, a useful chapter is given reviewing the decisions of justices and magistrates during the year. Motor-boats form the subject of Mr. Basil Joy's article, in which is predicted the lasting establishment of the marine internal-combustion engine industry on a sound mechanical and commercial basis. After a comprehensive review of aeronautics, some pages of "words from the wise and witty" conclude a volume which supplies a want, and should prove a useful contribution to the history of automobilism. The Year Book has been prepared with conscientious care, and as the volumes accumulate each year they will become a permanent and valuable record of one of the great forces of the twentieth century.

## SOME CURRENT TOPICS.

### A New Street Danger.

Reference has already been made to the nuisance that has arisen since the advent of the motor-'bus in London—that of deposits of thick lubricating oil on the roads—and we are consequently not surprised to learn that at the meeting of the Chelsea Borough Council last week the Borough Surveyor reported that he had written to the motor-omnibus companies using the Fulham Road, complaining of the great nuisance caused by the quantities of oil which leaked from their cars. Any amount of washing had no effect, and there were many greasy patches, especially where the vehicles stopped, which were a grave source of danger to cyclists and others.

### The Prevention of Dripping Oil.

As compared with the earlier vehicles much improvement in this regard has resulted from the adoption of modern lubrica-

### Electrical 'Buses for London.

On Wednesday last we had an opportunity of inspecting the first of a number of electrical 'buses which are about to be placed in service in London by the London Electrobus Company, Ltd. The vehicle is of the familiar double-deck type seating thirty-four passengers. The motor, which is of a special design made by the French B. T. H. Company, is located under the floor board at the front; it is connected by a silent high-speed chain to a cardan shaft below, from which the power is transmitted by bevel gear direct to the rear axle. The electrical energy is furnished by a battery of forty-four accumulators slung under the body of the vehicle in such a way that it may readily be substituted by a fully-charged one every twenty miles, or so, in the course of a few minutes. The controller, which acts on the armature of the motor, is adapted to give four speeds forward and a reverse. The advantages of electricity in the way of silence, ease of operation, and freedom from smell and vibration are, of course, obvious. The difficulty hitherto has lain in the excessive cost of maintenance of the batteries. This, however, those responsible for the new undertaking claim to have overcome, arrangements having been made with accumulator manufacturers to supply and maintain the same at a fixed charge. The cost of running the vehicle a daily distance of 120 miles is estimated at £4 9s., this including

The above illustrations are reproduced from photographs taken on a recent trip of two Daimler Cars—one a 35-h.p. and the other a 30-h.p.—from New York to Boston, U.S.A., a distance of 240 miles.

The run was devoid of any incident so far as the mechanical running of the vehicles was concerned, but the cars sank up to their hubs in mud upon an almost impassable piece of road between Bridgeport and New Haven. The 35-h.p. vehicle had previously taken part in the races at Ormond Beach, Florida, where it won the "Corinthian Cup" 10 mile race.

tion methods, but in many 'buses much still remains to be desired as to cleanliness, and now that the matter has been brought to official notice it behoves the engineers of the various motor-'bus companies to give the subject close attention. Since engine crank cases must get rid of their spent lubricant at a rate nearly equal to that at which it is fed, there must necessarily be a certain amount of escaping oil. Some of this finds its way between the shafts and their bearings, but it is evident that the road is not the proper place to deposit the same. Cars which are equipped with a continuous metal pan under the mechanism are nearly free from the defect of dripping oil, as the shield collects the drip. Most mechanisms which use oil as freely as does the motor-'bus have provisions for retaining the lubricant, and after being used once it is filtered and used again. Not only is this oil leakage very annoying and somewhat prejudicial to the good reputation of the motor-'bus, but it is certain that there is a very large sum of money wasted in oil escaping in this way—oil that is perfectly good and might be used repeatedly. There are thus two reasons for better practice in oil retaining devices for motor-'buses—greater cleanliness and economy.

30s. for the current and the maintenance of the batteries. In the course of a short trial run, the 'bus ran silently and without any unpleasant jerking or vibration. As compared with the petrol vehicles, the mechanism is of a simple character, the usual four cylinder engine and its attendant carburettor, water circulating pump, and ignition gear being replaced by a single electric motor, while the clutch and change-speed-gear box are entirely dispensed with, so that if the new 'bus fulfils the expectations made of it in actual practice on the road, it should prove a welcome addition to the streets of London. We understand that arrangements are in hand to put forty vehicles on the road at an early date, the first route being between King's Cross and Victoria.

TESTIMONY to the development of motoring in India comes by every mail. The latest news is the motor-car journey of Mr. Meadows, of the 4th Duke of Connaught's Rajputs, quartered in Swat, up the unmetalled Chitral road, through Dir. This is the most northerly trip yet attempted, and the arrival of the car aroused the liveliest interest among the subjects of the Khan of Dir, who had never seen such a machine before.

## THE CONNELL TYRE LEVER.

ONE of the most ingenious tyre levers which has so far come under our notice is that which has been devised by Mr. Robert Connell, of Gainsborough. The tool is mainly intended to facilitate the operation of fixing the valve stem of the inner tube and the security studs in position. Motorists know by experience that the task of inserting security bolts is rendered difficult owing to the fact that as one edge of the cover is lifted to a suitable position, the opposite bead has a tendency to slip forward and partly or completely cover the stud or valve holes. By means of the new lever this difficulty is entirely overcome; as will be seen, the tool consists of a duplex tyre lever provided with extensions pivoted at C. To lift the cover the lever is inserted in the ordinary way until the projections A on the upper arms are forced past the beaded

edge. At the same time projections B on the extensions or lower arms are forced just beyond the lip of the rim. The handle of the lever is now lifted, taking with it the edge of the cover by reason of the latter resting on the lugs A. As the handle is raised the lower end of the extension arms becomes fixed against the opposite bead of the cover, preventing the latter moving forward, owing to the resistance set up by the lugs B bearing against the rim. By means of the tool the cover can be held up by one hand, leaving the other free to insert the security bolts or the valve stem in their respective holes without any difficulty, while simply lowering the tool to almost a vertical position enables it to be easily slipped out of engagement with both cover and rim. The two extreme ends of the extension arms are rounded so as not to injure the spokes when the cover is being lifted. The set comprises the special forked arms and extensions and two ordinary tyre levers, one of which is used as the lifting handle; the whole is supplied complete in a leather case, the strap of

which is ingeniously made to serve the double purpose of holding the various parts in position and of fastening the case. Mr. Connell, who is the private secretary to Sir Hickman Bacon, Bart., a well-known motorist, has devoted considerable time and thought to perfecting the device, and assures us that not only does it enable medium-size tyres to be easily manipulated, but that it is equally effective with tyres above 105 mm. fitted with heavy non-skid bands.

## MOTOR-BOAT RACING AT MONACO.

THE third day's racing in the Monaco motor-boat meeting took place in glorious weather on the 10th inst. The first event was a 50 kilometre race for cruisers from 26 to 40 ft., and with engines up to 7½ litres cylinder capacity. Nine vessels started, the winner being M. Cruceq's Calypso, with Mors 45-h.p. motor, time 1 h. 28 min.; Mr. Gorham's Quicksilver, with Daimler engine, which was the only British representative, finished fifth. In the afternoon a contest for 60 ft. racers was held, this proving a victory for Messrs. Desmarais and Moraine's Delahaye, the time for the 50 kilometres being 1 h. 18 min. On Wednesday, the 11th inst., the principal race was for cruisers up to 60 ft. Only two boats turned out, however, the winner being the Pampa, with Fiat motor, which covered the 50 kilometres in 2 h. 2 min. 26 sec.; La Lorraine (Die Dietrich) taking 2 h. 19 min. for the same distance. The race for the championship of the sea took place on the 12th inst., in the presence of a large number of spectators, and proved a most exciting contest. Twenty-seven vessels started in the event, which was over a distance of 200 kilometres, boats of all descriptions, up to 60 ft. in length, competing together on level terms. The race was won by the Delahaye, which covered the course in 4 h. 40 min. Antoinette (Levasseur engine) was second in 4 h. 42 min., Fiat XIII. third in 4 h. 46 min., and Yarrow-Napier fourth in 4 h. 47 min. Friday, the 13th inst., was given over to handicap racing, cruisers and racers both covering a course of 50 kilometres. In the cruiser class there were nineteen starters, the winning vessel being the Florentia IV. (Florentia motor). In the racing class the English boat, Yarrow-Napier, won the handicap, Baron de Caters's boat, Seasick (with Itala engine) being second. The two boats started within one minute of each other, and ran a close race throughout. When 5,000 metres from home Seasick led by a length and a half, but the English vessel crossed the line 5 sec. ahead. The meeting was brought to a close on Sunday with a series of speed trials, in which a world's record was beaten. The latter was accomplished in the first series, for boats up to eight metres, Seasick (Itala motor) covering the flying kilometre in 1 min. 10.3-5 sec., which is at the rate of 31½ miles an hour. The final resulted in favour of Fiat XIII., Seasick being second, and Delahaye third, as follows:—

	Standing mile.		Flying kilom.		Total.	
	m.	sec.	m.	sec.	m.	sec.
1. Fiat XIII. ....	2	25	1	11 4.5	3	36 4.5
2. Seasick.....	2	26	1	15 4.5	3	41 4.5
3. Delahaye.....	2	35	1	16 2.5	3	51 2.5

MR. C. BURNETT, of Durham, is about to introduce to the motor world the "Tubeless" and "Cellular" pneumatic tyres, which will be distinguished on the market by his name. Among the features of interest is the method of attachment to the rim of the wheel. This is done by forcing the overlapping edges of the tyre against the projecting beaded edges of the rim or hoop of the wheel by means of lashing plates and bolts. An air-tight joint is thus obtained and no inner tube is necessary. Mr. Burnett has also introduced an automatic method of sealing punctures by internal air pressure acting upon a suitably formed strip of india-rubber or, alternatively, by the application of a woven endless wire band with ends overlapping. Another feature is the employment of air cells or suction cups on the tyre treads for securing increased adhesion on starting and for minimising sideslip. The trial of the new idea will be awaited with interest by motorists who have not yet discovered their ideal tyre.

MR. H. E. TEW is now undertaking motor repair work at 34, Thomas Street, Woolwich.

"SOMETHING new under the rain" is the title given to their new catalogue by Messrs. Samuel Brothers, the motoring tailors, whose Omne Tempus cloth has special claims on those who are likely to be out in all weathers.

A PUBLIC service of motor-cars is being started between Quito and Rio Bamba, Ecuador, South America. Five 24-h.p. De Dion cars and two 15-h.p. delivery vans have been ordered by the company inaugurating the same.

The Dennis 'Bus' built for the Great Eastern Suburban Omnibus Company for the service between Oxford Circus and Upton Park. The engine is of 30-h.p. and the transmission is by worm gear.

THE Continental Tyre and Rubber Company (Great Britain), Ltd., wish to draw attention to their Manchester branch, and hope that all tyre repairs in that district will be sent there instead of to their London headquarters.

MR. RALPH CHILD MEREDITH has opened a wholesale depot at Bournville, near Birmingham, for dealing in specialties for motor-cars. The firm's list of accessories includes accumulators, switches, sparking plugs, pumps, special cables for automobiles, etc.

At the meeting of the Council of the Roads Improvement Association, Incorporated, last week, arrangements were made for the annual meeting and a report received relating to roads in Carmarthenshire with a view to considering the advisability of supporting the Motor Union in connection therewith.

THE British Empire Motor Trades Alliance, Ltd., has received an enquiry from a firm about to establish an automobile agency in a large town in Central America desiring information regarding British motor vehicles and accessories. As the roads and streets are very bad the motor vehicles must be very strong.

THE motor safety signal has been invented to meet a want that the general adoption of covered motor bodies has created. The portion of the apparatus displayed to view is made of polished aluminium, ruby glass, with sand-blast lettering. The operating wire is of silver steel, and is connected with the clutch or brake, so that there is no extra operation for the driver, and he works the apparatus unconsciously. When the apparatus is not in use the wording is covered by a silk blind on a brass roller, worked by small steel chains on to a lever. The word "slow" is illuminated by electric four-volt lamps, the current being obtained from the ignition accumulator. A twin ignition wire is supplied for the current, and the apparatus is supplied complete in every detail by the United Motor Industries, Ltd.

## HERE AND THERE.

A NEW garage has been opened at Rostrevor, co. Down, by Messrs. Radford Bros.

MESSRS. DEAN AND BURDEN BROS., LTD., of Salisbury, are, we learn, taking up the construction of six-cylinder cars.

Their first vehicle—a 25-30-h.p.—is expected to be on the road by June next.

MESSRS. W. AND F. LEWIS have opened a new motor garage at 31, Victoria Street, Clifton—a matter of interest to motorists in the Bristol district wanting repairs done.

MESSRS. HYAM AND CO., LTD., have issued an attractive catalogue of their motor clothing. The section relating to ladies' garments and headgear is particularly well done.

MR. J. A. RYLEY has issued a full catalogue of his motor specialities for the 1906 season. The illustrations will be of particular value to all motorists requiring accessories, etc.

MESSRS. MCNEIL, HUTCHISON AND CO., LTD., have appointed Messrs. Moir and Co., of the Kensington Square Garage, W., agents for the Cottereau cars in London and the south.

At the annual general meeting of the Thames Iron Shipbuilding and Engineering Works, Mr. A. F. Hills, the chairman of the company, alluded with pleasure to the success of the new motor vehicle department.

PORTABLE ACCUMULATORS, LTD., have issued a neat price list of their ignition batteries, which are made in standard sets for bicycles, tri-cars, and light cars, as well as for automobiles of a larger type. Some useful advice is given to users of these well-designed batteries.

THE movement that is going on in London for the organisation of the motor-bus drivers has received encouragement from an action just heard in the Lambeth County Court, in which two drivers have been awarded £60 and costs against one of the companies for the loss of two fingers through backfires.

WE illustrate herewith a 24-h.p. petrol lorry recently built by Messrs. Thornycroft and Co. to the order of Messrs. Harris

Lebus and Co., of Tabernacle Street, London, E.C. The chassis is of the Thornycroft "type 80," the side chain drive being replaced in this instance by pinions and internal tooth rings on the driving wheels. Three speeds are provided, the flexibility of the engine rendering four speeds unnecessary. The working speed is twelve miles an hour, and we understand that the lorry makes several journeys daily from Messrs. Lebus' works to Kingston and district. In order to avoid delay during loading, two interchangeable platform bodies are provided, the loaded body being dropped on to the chassis by means of a crane.

THE Vanderbilt Cup race will be held on October 6th, and entries will close on July 1st.

PRINCE HATZFELDT has just acquired a 70-h.p. Mercedes car from Messrs. Ducros-Mercedes, Ltd.

THE Daimler Motor Company has subscribed 100 gs. towards the Motor Union Defence Fund.

THE omnibus and chassis shown by the Lancashire Steam Motor Company, Ltd., at the Cordingley Show were fitted with twin endless Royal Sirdar-buffer tyres.

MESSRS. G. T. RICHES AND CO. have just brought out a new line in the way of canvas gloves which, no doubt, will be appreciated by those motorists who look after their own cars. They will be found extremely useful in keeping the hands free from grease and dirt when carrying out any small repairs or adjustments on the car, or in filling up the lubricators, etc. The gloves are made of washable white or grey twill, so that they will last a long time.

THE epidemic of stone-throwing having ceased, the small boys of the United States have broken out in a new place, their latest game being the cutting off of number plates from cars. So bad has the

nuisance become that the Automobile Club of Pittsburg is offering a reward of 2s. for every plate found.

A MONTEVIDEO correspondent reports that the motor-car is rapidly becoming popular in Uruguay. Prior to 1905 there were but three vehicles in the country, and they were of French manufacture, while during the year just passed forty-seven were imported.

MR. C. A. SMITH, of the White Lion Hotel, Cobham, writes to remind motorists that there is a large yard at the rear of his place to which visitors should drive their cars when making use of the accommodation the hotel affords, instead of leaving them outside the front door.

A DENNIS worm-gear driven 'bus which has been on trial by Messrs. Thos. Tilling and Company has now completed just on 9,000 miles in a three months' test. Throughout the whole run the axle did not require any attention, and on examination the worm gear practically showed no signs of wear.

FROM the Swift Motor Company, Ltd., Coventry, we have received a copy of the latest catalogue of Swift cars. Full particulars are given of the various models—7-8-h.p. double-cylinder, 9-10-h.p. three-cylinder, and 12-14-h.p., and 16-20-h.p. four-cylinder, illustrations being also given of the chassis and of the various types of bodies with which they can be fitted.

AT a council meeting of the Central and Associated Chambers of Agriculture the chairman of the committee, Mr. St. John Ackers, said that before long the motor-omnibuses in London would displace a large number of horses, which would be spread throughout the country, to the danger of horses generally. At the present time glanders was concentrated in London and other large towns. No less than 79 per cent. of the loss caused by glanders took place in London.

AN armoured motor-car to be used in Mexico for hauling gold from the mines to the railway has, it is reported, been ordered from the E. R. Thomas Motor Company, of Buffalo, U.S.A. Ever since the mines were opened trouble has been experienced with the Yaqui Indians. The latter would attack the guards of the mule trains in the narrow passes and mountain roads, and it was necessary to increase the number of guards until the train resembled a small army. The advantages of a motor-car for this work having become apparent, plans for a special car have been prepared. The chassis and the larger part of the body are to be of the standard type, but armour plate will be used to cover the working parts, front seats, and tonneau, to protect the machinery and passengers from attacks both on level ground and while running through defiles where an attack might occur from above. The gold will be carried in the tonneau and two rapid firing guns will be mounted on the car.

THE first motor-boat built in Ireland is now under construction by the Dublin Dockyard Company.

ENNISKILLEN has its motor-car repairer in Mr. Joseph Maguire, whose premises are in Darling Street.

THE Bishop of Ripon has just purchased a motor landaulet from the Harrogate branch of the North Eastern Garages, Ltd.

MORE than fifty motor-cars visited Lynton and Lynmouth during Easter, nearly all being able to negotiate the hills with very little difficulty.

INCREASED rates and the advent of motor-cars were suggested as causes of his failure by a hay merchant who met his creditors in London the other day.

THE session of the Northampton Institute (Clerkenwell) Engineering Society has been concluded with a paper by Mr. E. H. Eldridge on automobiles.

MR. W. H. STONE, of Taunton, has a motor-car on hire in the town, which is being greatly appreciated by visitors to the Somerset and Devon seaside resorts.

MESSRS. COCKSHOOT AND CO., LIMITED, are building extensive new premises at Bridge Street, Manchester, where Mr. Conray Walker will act as manager.

SEVERAL of our technical contemporaries have noted the presence of a large number of persons interested in matters of local government at the recent Agricultural Hall Show.

MESSRS. H. M. HOBSON, LTD., have just sold a Decauville 16-20-h.p. car with a limousine body to Major Atcherley, the chief constable of Shropshire. This is the second Decauville the major has had.

MR. H. W. SOUTHALL, jun., of Birmingham, is sending out a neat circular detailing the advantages of the Gibson power indicator described in our columns on February 24th last. It is an admirable device for ascertaining the pressures developed in the internal combustion engine.

THE Adams Manufacturing Company, Ltd., have sent a number of photographs giving external and internal views of the new works they have recently erected at Bedford. The factory has been specially designed and equipped for the purpose of manufacturing one type of small car, the 10-h.p. Hewitt. The works are of the single-storey type, and cover an area of one acre. The building of the works has been in progress since last August; they are now complete, and the Adams Company inform us that the output is at present something over a car per day.

IT has often been recommended that when cars are only to be used at intervals they should be raised from the ground in order to take the weight off the tyres. To enable this to be easily done the Bicycle Step Ladder Company, of Chicago, have brought out the Murray automatic jack illustrated herewith. The device, which is supplied in sets of four, one for each wheel, consists of a short vertical piece mounted on a single wheel, the total length being slightly in excess of the height of the car axle. To this vertical part is attached a horizontal handle, with a brace to the small metal cap piece, adapted to engage with the hub of

Fig. 1.

Fig. 2.

the wheel. The jack, as in Fig. 1, is placed against the hub and a downward pressure on the handle causes a movement of the wheel, carrying the jack towards the axle of the car, and resulting in the axle being raised as in Fig. 2. The jack locks in an up position when the handle rests on the garage floor. Those for the front wheels are set with the handle to the rear and those for the rear wheels are to the front, the object being to anchor the car against movement either to the front or rear. The makers claim that by means of four of their jacks all the wheels of a car can be raised from the ground in from 15 sec. to 30 sec.

## CONTINENTAL NOTES.

### Public Services in Germany.

Companies have lately been organised to establish public services between Itzehoe and Lagersdorf, between Burg and Wilster, and between Bornim, Bornsted and Potsdam. The four motor-buses in service in Berlin are to be increased to twenty-eight by the end of July next.

### The Gordon Bennett Aeronautical Cup Race.

The Aero Club of France has just come to a decision with regard to the selection of the team of aeronauts to represent France in the Gordon Bennett Aeronautical Cup Race. The team will be constituted as follows:—M. Jacques Balsan, the Count de Castillon de Saint-Victor, the Count Henry de La-Vaulx. The following have been nominated as reserves:—Messrs. Jacques Faure, Georges Blanchet, and Edmond David.

### The Grand Prix Race.

The Sarthe circuit has been visited during Easter by many of the leading French racing men, including the Clement-Bayard and Renault teams. The Vulpes Company are building a somewhat novel form of vehicle for the contest. It will be provided with a four-cylinder engine 120 mm. bore by 160 mm. stroke, the transmission being by side chains. The suspension

and driving contest is to be held on July 11th, followed in the evening by a procession of illuminated cars. The meeting will be brought to a close on July 12th with a flower fete and a procession of decorated vehicles.

### The Rule of the Road.

The Automobile Club du Nord de la France, of Roubaix, is arranging with the authorities of the district for the erection of a number of notice boards drawing the attention of carters, wagoners, etc., to the rules of the road, and has voted a sum of £20 towards the cost of the same. In view of the increasing traffic on the roads, the idea is an excellent one, well worthy of adoption in other districts.

### The Circuit Europeen.

Preparations for the great long-distance competition organised for the months of July and August next by the automobile clubs of Germany, Austria, Belgium, France and Italy are in active progress. So far thirty-one entries have been received, these including three British Daimlers, two Beeston Humbers, and a Wolseley. The question of petrol supply has already been definitely settled as far as France is concerned. There will be set in operation an extremely practical system of exchangeable coupons enabling the competitors to find all

The Course near Lamnay.

A Straight Stretch near La Fourche.

VIEWS ON THE SARTHE CIRCUIT, ON WHICH THE RACE FOR THE GRAND PRIX DE L'A.C.F. WILL BE HELD.

of the car is on special lines, the frame being below the wheel centres. It has been decided to tar the whole of the circuit with the view of keeping down the dust.

### A Belgian Hill-Climbing Competition.

The Belgian Automobile Club held a hill-climbing competition, the proceeds of which were intended for the sufferers in the recent serious colliery explosion in France. The course was a mile long, and of the sixty-five competitors who took part in the event, the best time—1 min. 11 1-5 sec.—was made by M. Kinet on a Pipe car.

### A Belgian Heavy Vehicle Trial.

A proposal to organise a heavy motor vehicle competition between Brussels and Antwerp in September next is at present under consideration.

### The Scheveningen Automobile Week.

The automobile week at Scheveningen, the well-known Dutch watering place, is to be held early in July next. The meeting will open on July 9th with a concert; on the 10th there will be a competition (1) for the best covered car, and (2) the best open touring car, the body work in both cases to be of Dutch manufacture. In the afternoon there will be kilometre speed trials for touring cars and motor-bicycles. A gymkhana

through the country both petrol and oil at one uniform price, thus avoiding all mistakes or discussions.

### Miscellaneous Items.

The Queen of Italy has just offered an international cup to be presented to the first aeronaut who succeeds in crossing the Alps by balloon.—Eight entries, including that of the Cowey Engineering Company, Ltd., have been received for the Odotachymetre competition, which is being organised by the A. C. F.—The Moto Club de Belgique of Brussels is organising a spring wheel and tyre competition for June next.

THE next A.C.G.B.I. driving certificate examination will be held at 119, Piccadilly, on Wednesday next.

ON Easter Monday seven motor-cars were garaged at the Clifton Downs Hotel, Clifton, including one on which the Earl of Kimberley was touring in the west of England.

FROM the Frederick A. Stokes Company, New York, we have received a copy of a handy little dictionary of motor terms. It has been compiled by Mr. Sigmund Krausz, and contains over twelve thousand technical terms appertaining to motor-cars and motoring. These are set out in three languages—English, French, and German—and are arranged in three sections, so that the words in each language are given in alphabetical order, the utility of the work being in this way greatly increased.

## The Cordingley Show.

[Concluded from page 159.]

### The "Brown" Cars.

Messrs. BROWN BROS., LTD., exhibited a range of "Brown" cars, chief among which was the chassis of a new 20-22-h.p. vehicle. This has a pressed steel frame in the forepart of which is set a four-cylinder engine, 100 mm. bore by 120 mm. stroke. The valves are all mechanically actuated off one cam shaft, the inlets being provided with a variable lift obtained by means of tapered cams on a sliding shaft. Two high-tension systems of ignition, magneto and accumulators, are

illustrating a double phaeton. Examples of the Brown two-seated 10-12-h.p. double-cylinder and four-seated 18-20-h.p. four-cylinder vehicles were also on view, these being on similar lines to the 20-22-h.p. car described above. A part of Messrs. Brown Bros.' stand was devoted to exhibits of motor accessories of all kinds, including the E.I.C. ignition specialities, the "Duco" lamps, horns, tool-kits, etc., the H.F. tyre vulcanisers, and a new valve spring removing tool. We hope to illustrate the latter in a subsequent issue.

Figs. 99 and 100.—Elevation and Plan of "Brown" 20-22 h.p. car.

provided. The lubrication is maintained by a pump, as is also the water circulation, the honeycomb radiator being provided with a fan. No governor is fitted, the speed of the engine being automatically cut down as the leather-faced cone clutch is withdrawn. The latter is operated by a pedal, the lever extension of which acts direct on the clutch. The gear-box, which together with the engine is carried on a secondary frame, is adapted to give three speeds and a reverse, with direct drive on top speed through a cardan shaft and bevel gear to a live axle. The weight of the car is carried by the casing, the drive to the road wheels being squares on the ends of the axles. Ball bearings are fitted throughout with the exception of the engine. The gear-box is provided with an inspection lid which may be removed by undoing six thumb screws. The car, which appears to be well designed, has a wheel base of 9 ft. 6 in., enabling roomy side-entrance bodies to be fitted, Fig. 99

### A Portable Vice.

A useful addition to the tool kit of the touring motorist was the "Auto" vice shown by the AVERY AUTO VICE COMPANY. This tool has been designed to supply the want of a compact and portable vice which can be firmly fixed, leaving both hands free to work. Besides combining the advantages of a hand and fixed vice, the "Auto" possesses unique facilities for its use on the road at any time. By arrangement of a loose clamp or back jaw it can be fastened to a gate bar or any similar support found along the highway, to the width of about three inches. To do this an hexagonal bolt head at the end can be screwed by means of a spanner, or by placing a punch or nail through the hole in the bolt head. When screwed up it is quite firm and will stand any amount of strain. The jaws work independently, by means of the wing nut, and are of a size to grip anything likely to be used in

an ordinary vice. It is easily taken to pieces for packing purposes, &c. being only five inches long, takes little room, and is a small but useful device.

#### The "Green" Car.

A 26-30-h.p. car comprising a number of interesting features was that which was exhibited by GREEN'S MOTOR PATENTS SYNDICATE. As will be seen from Fig. 103, the frame is of special tubular construction, the tubes, which are 2 in. in diameter, being built up without brazed joints. The spring horns are made as part of tubes which slide in the main tube, while the hangers which support the rear shackles of the front springs and the forward shackles of those at the back slide on the main frame, they

Fig. 101.—The "Brown" 20-22-h.p. car. (See page 176.)

being fixed in position by cottars. By this means either the front or rear axle, together with their springs, can be readily detached from the frame. The engine is carried directly on the main frame by bearers, the ends of which are provided with top and bottom caps bolted together. The engine can thus be quickly drawn out of the frame, or by removing the bolts from the caps on one side the whole engine can be tipped over through an angle of nearly 90 deg. Furthermore the bottom half of the base chamber can be removed without disturbing the crankshaft, so rendering the inspection and adjustment of the big ends, when the motor is canted over, an exceedingly easy matter. The recesses in the carrying brackets of the engine are provided with lids so that they form receptacles for the oil can, waste, and a few small tools. The motor, which comprises four separate cylinders 4 5-16 in. bore by 5 1/4 in. stroke, is also of a special design, one peculiarity being that the inlet and exhaust valves open directly into the cylinder heads,

a vulcanised rubber ring which fits in the groove E. The jacket entirely surrounds the cylinder, holes being left in the top which coincide with the openings of the valve chambers and sparking plug hole and also at the sides for the inlet and exhaust ports. The water joint at the top is made by the locking rings used to hold the valves, etc., in position. Perfect freedom for expansion is allowed and a leakage is stated to be practically unknown. Apart from its lightness one of the advantages of the arrangement is that the jackets can be removed as often as necessary for clearing any corrosion or deposit. The power is transmitted through a leather-

Fig. 102.—Details of Cylinders of the "Green" Motor.

- |                               |                                      |  |
|-------------------------------|--------------------------------------|--|
| A.—Cylinder.                  | E.—Groove for Vulcanised Ring.       | H.—Exhaust Valve and Seating Complete. |
| B.—Valve Chambers.            |                                      |  |
| C.—Seatings for Water Jacket. | G.—Inlet Valve and Seating Complete. |  |
| D.—Sparkling Plug Port.       |                                      |  |

faced cone clutch to a gear-box of the ordinary type and thence by a cardan shaft and bevel gear to a rear live axle. The steering gear is of special design, it being capable of being set at any angle. A Rex 3 1/4-h.p. motor-bicycle was also shown, the cylinder of which has been removed and replaced with one of the "Green" design shown at A in Fig. 102, the brass water jacket of which is extended to form a combined tank and double radiator, as seen on the right of Fig. 102. The radiators are supplied with expansion chambers, which prevent the water from overflowing when it first gets warm. The weight of the new

Fig. 103.—Chassis of 26-30-h.p. Car exhibited by the Green's Motor Patents Syndicate.

being operated by jointed rods and tappets; not only so, but in place of a cam shaft running the whole length of the motor the cams are mounted on a short shaft at the front end, operating the valves from each side of the cylinders through hollow rods, telescoping one with the other as regards the horizontal portions. The short cam shaft above referred to also drives the water circulating pump and the radiator fan. The valves themselves, together with their seatings, are also so arranged that they can be withdrawn with a minimum of trouble, the tappets being made to swing out of the way. One of the most important characteristics of the engine is the jacketing of the cylinders. An idea of the shape of the latter is seen from the illustration at the left hand of Fig. 102. Around this is slipped a brass water jacket, a perfect joint between the jacket and cylinder being formed at the lower end by

cylinder together with its jacket and radiator jacket is 16 lbs. 7 oz., or 2 lb. 2 oz. lighter than the air-cooled cylinder which it displaced. Considerable interest was shown in the exhibit during the week of the Show, the arrangement of the valve gearing and of the water jackets attracting considerable notice. More will no doubt be heard of them in the near future.

#### Tools.

Messrs. CHAS. CHURCHILL AND CO., LTD., had a show case containing a selection of portable tools, motor wrenches, and the like, as well as other larger appliances for the equipment of motor-car works. A boring machine for cylinders, lathes, gear-cutting machines, grinders, etc., made up an utilitarian exhibit.

**The New Leader Cars.**

Several examples of the latest types of New Leader cars were exhibited by CARS, LIMITED, including a new 20-30-h.p. model shown for the first time. The frame is of pressed steel construction, and the engine (Fig. 104) comprises four cylinders 4 in. bore by 6 in. stroke, with the valves all operated off one cam shaft. The ignition is by single trembler coil and accumulators with high tension distributor. The water circulation is maintained by a gear-driven pump and honeycomb radiator. A special form of carburettor is employed, in which all the air has to pass the spraying jet, the feed of petrol through which is also adjustable. The lubricating oil is contained in a large tank under

Fig. 104.—The New Leader Four-Cylinder Engine.

the footboard, where it is not only out of sight, but is kept in a fluid state by its proximity to the exhaust pipe. A hand-pump on the dashboard forces air into the tank, and the oil is fed to the distributor and through large sight glasses to the different parts of the mechanism. The clutch, which is of the leather-faced cone type, is connected with the gear-box by a jointed-shaft. Three speeds and a reverse are provided, with direct drive on top speed through a cardan shaft and bevel gear to the rear live axle. Combination roller and ball bearings are used to all parts. Other cars on view included 8-h.p. and 10-12-h.p., both being fitted with four cylinder engines. Except that the water circulation is on the thermo-syphon system these vehicles are very similar in arrangement to the 20-30-h.p. dealt with above. Altogether the New Leader cars have a smart, trim appearance, and their moderate price is making them a popular type amongst motorists in this country.

No governor is provided, the speed of the engine being controlled by hand and foot levers acting on a throttle valve. The clutch, of which a sectional view is given in Fig. 105, is of the multiple disc type with a progressive engagement, so that the load is taken up very gradually and without shock. A very simple adjustment, by means of one nut, is provided for regulating the pressure of the clutch spring. The device works in oil, the cover M being provided with

Fig. 105.—Section of Marchand Disc Clutch.

leather at the hole through which the shaft B projects. The gear-box, which is supported on the frame at three points, is adapted to give three speeds and a reverse with a direct drive on top speed. The latter is obtained somewhat on the lines of the Mors arrangement, the two shafts of the gear-box each having a bevel pinion on its end and meshing with its own bevel wheel on the differential shaft, from which the power is transmitted to the rear road wheels by side chains. Ball-bearings are used to all parts, except the engine, the car throughout being one which should well maintain the excellent reputation enjoyed by Italian vehicles. Under the name Premier the PREMIER COMPANY are also introducing a series of cars of Belgian construction, the one on view being

Fig. 106.—Chassis of Marchand 20-24-h.p. Car.

**The Marchand and Premier Cars.**

Reference has already been made to the fact that a feature of the Show was the exhibition for the first time of several Italian built cars not previously seen in this country. Among these was the Marchand, the British agency for which has been secured by the PREMIER MOTOR CO., LTD. Several sizes, ranging from 14-18-h.p. to 40-50-h.p., are being made, the chassis on view being of the 20-24-h.p. type (Fig. 106). The vehicle has the usual pressed steel frame. The engine comprises four separate cylinders with valves operated off separate camshafts. The ignition is by a gear-driven high tension magneto, and the water circulation by pump and honeycomb radiator with fan. The crankshaft is provided with five bearings, and the lubrication is maintained by a pump with pressure feed.

of 16-20-h.p. (Fig. 107). The vehicle follows the standard lines of live-axle cars, the details, however, showing a number of interesting features. In the first place, the engine comprises four separate steel cylinders 95 mm. bore by 120 mm. stroke, with cast iron heads and water jackets; the valves are arranged on opposite sides and operated off separate cam shafts. Five bearings are provided to the crank shaft and the lubrication is maintained by an oil pump in the base chamber. Ignition is by high-tension magneto, a reserve set by coil and accumulators being also provided. The water circulation is maintained by a pump and honeycomb radiator with fan. The speed of the engine is controlled by foot and hand levers operating a variable lift on the inlet valves. The latter is obtained by means of a rock acting on a toothed portion on the valve push rods, which causes the latter to

rise or fall. The clutch pedal is also so connected up to the latter that as the clutch is withdrawn the engine is prevented from racing. The transmission is through a leather faced cone clutch to a change-speed gear giving four speeds and a reverse. On the top speed the drive is direct, the side shaft in the gear-box being entirely out of operation. The final drive is by a cardan shaft and bevel gear to a live axle. The latter is of special design, being supported by a fixed axle at the rear.

on ball bearings. In conjunction with the clutch a special device is provided for allowing a sweet and steady engagement; in line with the clutch pedal and below the footboard is a small horizontal cylinder containing glycerine, a piston having a rod projecting through the casing of the cylinder works in the latter. The rod is connected up to the clutch pedal, and when the clutch is disengaged the glycerine is pushed away from the rear to the front by the piston; and *vice versa* as the clutch

Fig. 107.—Chassis of the Premier 16-20 h.p. Car.

The usual four longitudinal springs are supplemented by a transverse one at the rear.

#### The Humber Cars.

The great centre of attraction at the stand of HUMBER, LTD., was the chassis of the new Beeston Humber 30-40-h.p. six-cylinder car, of which an illustration is given in Fig. 108. As will be seen, the cylinders, which are 100 mm. bore by 100 mm. stroke, are cast separately, with the inlet and exhaust valves arranged on opposite sides. The mixture is furnished by a Krebs automatic carburettor, and the speed of the engine is controlled by a variable lift to the inlet valves obtained by means of tapered cams on a sliding shaft. Two systems of high tension ignition are provided—magneto and coil and accumulators. The water circulation is maintained by a honeycomb radiator with fan and a rotary

is allowed to engage. The differential box is split horizontally for convenience of inspection; the large bevel wheel, contains a spring drive which allows three-quarters of a revolution of the engine before the back axle begins to move. The road wheels run on ball bearings mounted on the axle sleeve. The driving shaft and the bevel pinion shaft are also mounted on balls, thrust bearings being also fitted on either side of the bevel wheel and behind the pinion, ensuring perfectly smooth and silent running. All the engine bearings are lubricated by oil supplied under pressure from a positively driven gear pump attached to the crank case. A foot-operated water-cooled brake is fitted to the driving shaft, while another foot brake is attached to the differential gear-box and enclosed in the back-axle case. The usual hand-applied brakes working on drums on the rear road wheels are also provided.

Fig. 108.—Chassis of Humber Six Cylinder Car.

pump, the latter being so fitted that it can be readily dismounted. The transmission is through a leather-faced cone clutch to a gear-box giving four speeds and a reverse with direct drive on top speed, through a cardan shaft and bevel gear to the rear live axle. This gear is designed so that the changes from one speed to another can be made without meshing the intermediate pinions. For example, a change can be made from the top to the lowest speed without interfering with either the second or third speed gear wheels. Both shafts in the gear-box run

The frame, which is of pressed steel and supported on long springs, is of a curved design at the rear, somewhat similar in plan to the stern of a boat. The car has a wheel base of 9 ft. 11 in., enabling a roomy side-entrance body to be fitted. The Humber Company also exhibited examples of the latest Beeston Humber 16-20-h.p. and Coventry Humber 10-12-h.p. vehicles, both of which are fitted with four-cylinder engines. Details of them have already been given in these columns, but we note that several improvements have been made in the 16-20-h.p.

model notably the adoption of ball bearings throughout the transmission gear (Fig. 109) and on the road wheels, and the redesigning of the rear live axle. The casing surrounding the latter is now divided horizontally, so that it is possible to inspect the differential gear and the bevel wheels without dismounting the axle itself. The weight of the vehicle is carried on the casing, the internal shafts having only to withstand the driving effort. Eight sets of ball bearings are

Fig. 109.—The Gear Box of the Beeston Humber 14-20-h.p. Car.

employed on the rear axle, those which carry the wheels being of large diameter. The universal joints on the cardan shaft are completely enclosed in aluminium casings, which provide a constant oil bath. The Humber has gained an excellent reputation during the last year or so, which the latest models should more than maintain.

#### The Cottareau Cars.

A very wide range of the Cottareau cars, fitted with one, two, three, and four cylinders, was exhibited by the British agents, Messrs. McNEIL, HUTCHISON AND Co., of Manchester. The 8-h.p. single-

inspected was a 12-h.p. double cylinder with pressed steel frame and live axle. Two models of three-cylinder cars were also shown, 12-14 h.p. and 18-h.p., the dimensions of the former being 85 mm. bore by 105 mm. stroke, and of the latter 95 mm. by 120 mm. The Cottareau engines have separately cast cylinders with mechanically-operated valves, arranged on opposite sides. The speed of the motor is regulated by means of a variable lift device on the inlet valves. Details of the latter are given in Fig. 110, from which it will be seen that the valve push rods are formed with teeth at B meshing with a rack D.A. As the latter is moved to and fro the push rods are rotated and at the same time rise and fall by means of a screw thread formed on their lower ends.

Fig. 110.—Front and Side Sectional Elevations and Plan of Cottareau Variable Valve Lift.

The arrangement is stated to effect a considerable economy in petrol consumption, an 18-h.p. three-cylinder car with five up having completed a four days' tour on an average of  $27\frac{1}{2}$  miles to the gallon. The vehicles have pressed steel frames and are chain-driven, the transmission being through a leather-faced cone clutch and gear-box giving three forward speeds and a reverse. The four-cylinder cars, which are respectively 15-18-h.p. and 20-25-h.p., are on similar lines to the three-cylinder vehicles, the chassis being of such a length as to be able to accommodate roomy side-entrance bodies. Considerable interest was also

Fig. 111.—Elevation of Chassis of Cottareau 20-25-h.p. Four-Cylinder Car.

cylinder car is made in three models, one having cardan shaft transmission, another is driven by side chains, while the third has a single chain drive on to a live axle. The first two have pressed steel frames and the latter one of tubular construction. Three speeds and a reverse are provided. The motor has a bore of 105 mm. by 118 mm. stroke, has mechanical valves, and is controlled by means of a variable lift device to the inlet valve. The next car we

shown in the Cottareau 160-h.p. six-cylinder racing car (Fig. 113) shown at this stand. The engine has the inlet and exhaust valves operated by separate cam shafts; two carburetors are provided, one for each group of three cylinders, and on the top of each of the two induction pipes is mounted a throttle valve, operated by a lever on the steering wheel. The clutch is of special form, the leather-faced cone being supplemented by a positive locking arrangement. Side chain transmission is provided.

while large braking power is available. Notwithstanding the six cylinders, the weight of the car has been kept within the 1,000 kilog. limit. A safety starting handle known as Bishop's was also shown by Messrs. McNeil, Hutchison and Co. The device consists of a handle furnished with a ratchet wheel and an adjustable pawl. The latter engages

holding two injured persons in a recumbent position on stretchers, and also has seats for nurses and attendants. Every provision is made for the comfort of the passengers, while the front seat and floor of the vehicle is made in such a way that ready access to all parts of the engine and transmission is possible. We understand that one of these

Fig. 112.—The Wilson and Stockall Motor Ambulance.

tangentially, with a starting tooth on the end of the engine shaft and can be adjusted to the compression of the engine. Should a back-fire take place, a ratchet wheel at the other end of the starting device sets back against two pawls attached to a bracket which is fast to the frame of the car, which thus takes the resistance of the back-fire, whilst, at the same time, the adjustable starting pawl loses its tangentiality and is forced back out of its notch, thus relieving the starting handle from pressure.

**The Wilson and Stockall Motor Ambulance.**

Messrs. WILSON AND STOCKALL, of Bury, an old-established firm of ambulance specialists, had on view a motor ambulance which

ambulances has already been ordered by the municipal authorities of Milan.

**The Courier Cars.**

The EUSTON MOTOR COMPANY had on view two models of the Courier cars they have recently placed on the market. The vehicles, which are of French construction, follow the usual lines of live axle machines and appear to be of sound and solid construction. We first inspected the 14-16-h.p. vehicle, which is fitted with a Gnome four-cylinder engine 85 mm. bore by 110 mm. stroke and mechanically-operated valves. Three speeds and a reverse are provided, the final

Fig. 113.—Chassis of the Cottareau 160-h.p. Six-Cylinder Racer.

attracted considerable attention, not only from ordinary visitors to the Show, but also the officials of the Metropolitan Asylums Board and other authorities. The vehicle, Fig. 112, is mounted on a Cottareau 12-14-h.p. chain-driven chassis. The body of the vehicle is capable of

drive being by side chains. Interest in the 18-24-h.p. model was increased by the presence of a car which has been driven over 8,000 miles by a lady. This is also fitted with a Gnome motor, the transmission in this case, however, being by a cardan shaft on to a live axle.

### The Metallurgique Cars.

No less than five sizes of the Metallurgique cars, ranging from 10-12-h.p. to 40-45-h.p., were shown by Mr. OSCAR CUPPER. The vehicles are made by one of the leading engineering concerns in Belgium and have already earned an excellent reputation on the Continent. The 10-12-h.p. car has a twin-cylinder engine and leather-faced cone clutch; the 16-20-h.p., 24-28-h.p., 30-35-h.p., and 40-45-h.p. have four-cylinder motors and a special expanding metal-to-metal clutch. While describing more particularly the 30-35-h.p. car, the following details may be taken as applying to the other models, the main features being pressed steel frames, an internally expanding metal clutch, and a spring drive on the rear end of the cardan shaft, the transmission being by live axle.

Fig. 114. — Sectional View of Variable Valve Lift Mechanism on Metallurgique Cars.

allow for any want of alignment between the two parts when travelling over rough roads. The gear-box, of the Mercedes type, is fitted, and gives four speeds and reverse. A cardan shaft conveys the power through a spring drive and bevel gear to the live axle. The spring drive is mounted in a drum set on the end of the bevel pinion spindle, having two lugs opposite to each other projecting inwards from the rim. The cardan shaft ends in a forked piece, each end of which bears against one end of a spiral spring, and bearing as to its other end on one of the projecting lugs, the power being transmitted through the forked ends, the springs, and the lugs on the drum, and by the latter to the bevel pinion. The device is claimed to prevent shock on the bevel drive and to considerably reduce the noise. Ball bearings of the D.W.F. type are employed throughout except on the engine. The carriage bodies shown were of a very high order, a 24-28-h.p. double phaeton with Cape cart hood, and a 30-35-h.p. limousine (Fig. 115) being especially worthy of note.

### The "Draknor" Ignition System.

Among improvements introduced into the Draknor contact breaker since it was originally described in the *M.C.J.* is a new unbreakable trigger, which secures a good sharp break independent of the engine speed. The Draknor contact made by Messrs. DRAKE AND NORMAN works on the "positive make and break" method of a non-trembler coil, thus ensuring precision of firing. The Draknor has no platinum points, solid hard cast steel contact pieces being employed in the form of the spring-controlled triggers already mentioned. In the case of multiple-cylinder engines the Draknor is permanently synchronised, and the life of the system is another point that will appeal to motorists. It starts with notable ease, can be easily and quickly fitted, and constituted one of the attractions in the accessory section of the Exhibition.

### Accessories.

The "Imperial" Odometer associated with the name of Messrs. Flory, Reinpach and Company was shown by Messrs. G. DAVENPORT and Co., who point out that it can be used to ascertain the consumption of petrol per mile. The instrument can be applied to any make or size of car, and no special fitting or drilling is required to fit it to the vehicle. The Odometer fitted with the Veeder trip and mileage cyclometers makes a handy addition to the motorist's equipment, and with the "Imperial" watches, petrol gauges, electric lamp adapters etc., formed a very effective display.

### Speed Indicators, Etc.

A large display of speed indicators, electric communicators, milometers, motor timepieces, chronographs and similar instruments was made by Messrs. S. SMITH AND SON, whose specialities for motorists are well known. Their "Perfect" speed indicator and trip recorder has a mileage register up to 10,000 miles. Every instrument is guaranteed for a year. It is made in various types to register up

to forty, sixty, eighty-five, and one hundred miles per hour, and it desired can be supplied fitted with supplementary or "tell-tale" hand, which shows the maximum speed attained. This latter may be set back to zero by simply pressing the small button at the top of indicator. The indicator is also fitted with a chart which gives a pencil record of the speeds during the last twelve hours' run. The milometer was also shown as well as a new "Electric Communicator," for communicating with the driver from the interior of the car. In this a different coloured lamp is fitted for each direction sign, the idea being that the driver, after a short use of the instrument, knows the meaning of each different colour.

### The Hutchinson Tyre.

Hutchinson tyres made a satisfactory first appearance at these Shows. They are specially intended for cars and voiturettes, and appear to be of excellent quality. All kinds of accessories for the repair of covers and inner tubes were also shown, as well as the "Hutchinson" repair outfit. The "Vulcan" non-skid pneumatic tyre, which recently accomplished a 4,000 kilometre test in France without puncture, and with the rivets complete, was also on the stand. In conclusion, we would mention that repairs of every description are undertaken by the ETABLISSEMENT HUTCHINSON.

### Aluminium.

Mr. R. W. COAN was in his familiar corner near the entrance displaying to considerable advantage his various castings in aluminium, as well as a steering wheel in that metal. Examples of crank-cases and gear-boxes in which new sections had been successfully burnt in were a feature of a good display.

### Shrewsbury and Challiner's Tyres.

A comprehensive display of wheels and tyres suitable for all kinds of automobiles, ranging from a light two-seated vehicle to motor-omnibuses and other forms of heavy traffic, was made by the SHREWSBURY AND CHALLINER TYRE COMPANY, LTD. Their specialities include the well-known Road, Giant and World tyres, which have done good service, their excellent design and quality contributing to longevity and durability.

### D. W. M. Bearings.

Messrs. LUDW. LOEWE AND CO. had a representative collection of small tools and gauges for the motor workshop and garage as well as a Norton plain grinding machine, specially suitable for finishing gear shafts, axles, and other cylindrical parts, after they have been rough turned in the lathe. With this machine a finish can be obtained which is perfect for all practical purposes, in considerably less time than by older methods. The latest pattern of the D.W.M. patented bearings was also shown. This not only effects a great saving in power, but also in the cost of fitting.

### Salsbury's Specialities.

Although not so numerous as in some earlier displays, the show of lamps made by Messrs. SALSBUURY AND SON, LTD., was quite as comprehensive in the number of patterns shown, and a new style of

Fig. 115. — The Metallurgique 30-35-h.p. Limousine.

"Salsbury-Flare" was displayed to advantage. This is fitted with a mirror lens reflector and a lens condenser of bullet pattern. The "Dainty" and the "Peerless" are two new patterns in Salsbury-Dietz lamps which attracted some attention. Jacks, horns, funnels, the new "Era" accumulator and a petrol gauge of ingenious design were included in a capital display.

Messrs. BEVAN, HOGG AND CO. had a small but varied display of their hoodsticks for use in connection with canopied cars, bent rails, wings, panels, etc., the work on view demonstrating their capacity in this direction.

Messrs. C. FONTEYN, LTD., had an interesting exhibit, included in which were the Auto-Fauteuil motor-bicycles and tri-cars. The cycle is fitted with a 3½-h.p. water-cooled engine and is started by a handle as in the case of a car. The valves have large seatings and are mechanically operated by one cam. They are also interchangeable. A chain drive is employed, and by reason of the clutch and free engine a very flexible drive is obtained. The change-speed gear employed enables an engine of a low power to be used, thus reducing the weight and securing a machine that can easily negotiate hills. A noticeable exhibit on this stand was the Alcyon 7-h.p. car. The engine is fitted with mechanically-operated valves

Fig. 116.—The Alcyon 7 h.p. Car.

transmission is by cardan shaft, three speeds and a reverse being provided with direct drive on top speed. The weight of the Alcyon car, which has been introduced for "the man of moderate means," is only 7 cwts., and a speed of thirty miles an hour is obtainable with the machine. Some good types of belts were also shown on this stand.

#### Petrol and Oils.

On their familiar stand Messrs. CARLESS, CAPEL AND LEONARD exhibited specimens of packages for the conveyance and storage of petrol, oils, etc., and also their patent safety lamp for lighting buildings where motor-cars are kept, or for use in any buildings where inflammable materials are stored. It is also adapted for lighting vehicles laden with mineral spirit and other inflammable oils. This safety lamp can readily be lighted without being opened, and can be locked so that it can only be opened by means of a powerful magnet. At this stand were also shown samples of standard petrol and of petrol especially suitable for tropical countries. Fuel oil, the Carline lubricating oils and the "S" lubricating oil for air cooled or for water cooled motors running at great speeds were also on view, while visitors on trial runs from the yard were able to judge for themselves of the good quality of Messrs. CARLESS, CAPEL AND LEONARD'S petrol, this being freely allowed to exhibitors sending vehicles on such trips with prospective buyers.

#### Marconi's Coils.

Nearly a score of Marconi ignition coils were exhibited by MARCONI'S WIRELESS TELEGRAPH COMPANY, LTD., whose new works are well equipped for a large and varied production. Among notable types is the 35 A, with terminals enclosed, and intended for use on boats or cars where the ignition apparatus is fully exposed to the weather. For use on two-cylinder cars where economy of space is essential a coil has been introduced the terminals of which are brought out at the bottom of the case, obviating the use of a double front, and allowing the width of the coil to be brought down to a minimum. A special feature is being made of the "coil de luxe," specially designed for motorists desirous that the appearance and finish of all accessories should harmonise with the general lines of the car. In this design the coil lies flat against the dashboard, the use of lugs being dispensed with by the extended back pieces. An interesting apparatus introduced by the Marconi Company is an accumulator charging device capable of a secondary output of forty watts. This and a capital selection of accumulators, ammeters, plugs, high-speed trembler coils, etc., made up an interesting display.

#### The Lune Valley Radiators.

THE LUNE VALLEY ENGINEERING COMPANY exhibited their new radiator on part of Messrs. McNeil, Hutchison and Co.'s stand. The principle of their water cooling apparatus was dealt with in our description recently of the Critchley-Norris motor-bus, but we may mention that the object of the arrangement is to obtain a radiator which shall be entirely free from leakage troubles. The apparatus has only a lower box, which is perforated on the upper side with a number of tapped holes, into which are fastened separate copper tubes which have been sealed at each end after being partially charged with methylated spirit, as well as having had the air removed. The water which is desired to be cooled is passed through this bottom box, and in so doing it causes the liquid in each of the tubes to boil, and consequently extract heat from the water, distributing it equally over the whole of the cooling surface. The fluid vapour

which pervades the upper portion of these tubes is continuously being condensed by the cold air passing through the gilled surface of the tubes, so that the cycle of events occurring in each tube is continuous. The tubes being all separate from each other and fitted to the tank by being screwed therein, may be replaced, should necessity arise, in a few minutes without removing the radiator from the frame of the vehicle, while should one or more of them be damaged in any way no loss of water would result, the only effect being to reduce the efficiency by the number of tubes actually affected.

#### Accessories.

THE NEW CLEVELAND MOTOR ACCESSORIES COMPANY had many novelties deserving attention. Among them were the A.D. Panhard plug and the Cleveland terminal. The latter is made up from sheet steel in two pieces, one of which is for attaching to the wire by claws and having a tongue in the end of which a hole is bored. This tongue is pushed into the slide of the other portion, where it is held by a spring button entering the hole of the former. It can be detached by a pull. The Pognon H.T. and magneto sparking plugs were also prominent on the stand as well as a good head lamp having a reversible inner lens, one side of which is concave and the opposite side flat, thus serving to concentrate the light on one side and on the other to diffuse it, according to which side is in use at the time. It is instantly reversed by opening a clip and twisting the frame to which the lens is attached.

#### The Gratz Patents.

Considerable variety was an innovation on the stand of GRATZ PATENTS AND ENGINEERING SYNDICATE, LIMITED, where the speed indicator and mileage recorder has, hitherto, shared the honours of the display with the firm's improved Planté accumulator. This year novelty was imparted to the exhibit by the presence of the Gratz contact breaker, which can be made for any number of cylinders; also for high tension current distributors. Simplicity and efficiency are its claims to recognition. The Gratz accumulator is a well made device which the firm assert will last for years. It gives an output of eighteen watts per lb. weight and will stand 100 per cent. overcharge or a short circuit without injury to the plates. In the manufacture of the accumulator the positive plates are first moulded, with very fine inter-sections, in blue lead; they are then placed in vats containing a special electrolytic solution, and the per-oxide deposited on them by electrolytic action, until all the cavities are filled, and the lead itself, with the exception of a central core, is turned into active material, attaining at the same time a great degree of hardness. The negative plates are first cast from metal alloy in the form of a lattice work, and they are then filled with special composition, placed in a forming bath and a current passed through them, with the result that a hard and compact mass is obtained. It is therefore evident that such things as disintegration, buckling, sulphating, short circuiting, or any calamities are obviated; moreover, a greater capacity is attained with less weight of material. The Gratz patent speed indicator, which did so well in the A.C.G.B.I. trials, was also on view, naturally attracting much attention from practical motorists.

#### The "Channel" Marine Motor.

Mr. A. L. DAVIS, of the Channel Motor Company, came from Guernsey with his "Channel" marine motor, a special feature of which is the reversing gear giving free engine and direct drive ahead and astern with one lever only. The motor is made in 6, 12, and 24-h.p. sizes. In the two and four cylinder engines the cylinders are placed on opposite sides of the crank chamber at an angle of 90 deg., and slightly staggered with reference to the central line of the chamber to enable each pair of cylinders to drive on to the same crank pin. For this arrangement reduced weight and increased strength are claimed owing to the reduction by nearly a half of the length of crank shafts and crank chambers. Less vibration than usual is obtained by the better balancing of the moving parts, while the reduction of the number of working parts and the greater accessibility for adjustment and repairs are other distinct advantages.

For the Crown sectional leather tyre shown by Messrs. W. JENKINSON AND CO. it is claimed that it possesses the merits of being non-skidding and securely puncture proof, while being more durable and less expensive than the usual form of tyres.

AMONG the miscellaneous exhibitors were HORLOCK'S FOOD COMPANY, who showed their malted milk in the form of tablets intended for motorists when on tour. Messrs. M. and E. MARX made a good display of stencil plates and the like as well as of "Garlio," a cloth for cleaning cars, made entirely from waste silk. An office was also occupied by Messrs. J. DEFRIES AND SONS, LTD., from which to direct the fitting of several attractive stands in the Hall. Rubber stamps and stencil plates for making the registered numbers on motor-cars were exhibited by Messrs. HELLER AND CO., who made a good display of their specialities.

MESSRS. RODGERS, BROS., had a varied display of their gears, spindles, cranks, bearings, and similar work for motor-car engineers, additional interest being given to their display by the presence of a 20-24-h.p. four-cylinder engine made by the Eclipse Engineering and Motor Manufacturing Company, of Earlsfield Road, Wandsworth, S.W. This has the valves all on one side, and was a creditable piece of work.

### The Autoloc.

One of the novelties which attracted many visitors to the Gallery was the Autoloc, shown by the syndicate of that name, which had also on view the Hamilton radiator and the Hamilton carburettor. The Autoloc, we may explain, is a new mechanical device which may be used as a lock, a hinge, or a lever, and is designed to supersede the ratchet and notched quadrants and bars. The invention consists of a device for immovably locking together any two members of a rotating or sliding mechanism in such a manner that relative movement is rendered impossible by force applied to either of those members, whilst provision is made for obtaining relative movement by the application of small force in either direction to a third member. The adjustment of movement between the two parts forming

Fig. 117.—Part Sectional Elevation and Plan of "Autoloc."

the turning or sliding pair may be made as large or as small as may be desirable. In fact, the adjustment is infinite and the lock absolute in an infinite number of positions, whilst there can be no backlash in the mechanism. The device is being utilised in many directions, some of which may be enumerated as follows:—Control levers for automobiles, change-speed levers, steering gear, lifting jacks, tyre levers, etc. When used in connection with the steering column of a car this form of control lever dispenses with any form of rack, and, whether the levers are operated in a horizontal or vertical plane, they remain locked in any position in which they are moved without the assistance of a ratchet.

### The J. P. Cars.

The J. P. MOTOR COMPANY had on view a trio of live-axle cars, which, while comprising no startling deviations from modern practice, appear to be of sound construction, while their moderate price should recommend them to many motorists. We first inspected a 24-30-h.p. vehicle which has a Gnome four-cylinder engine set in the fore part of a pressed steel frame. The valves are all mechanically actuated and the ignition is by high-tension magneto, and also by accumulators and coil, the latter being fitted as a reserve. The clutch is of the leather-faced cone type of large diameter. Four speeds and a reverse are provided, with direct drive on top speed through the cardan shaft and bevel gear to the live axle, the latter being of exceptionally strong construction. The weight of the car is carried by the sleeves, the drive to the road wheels being through squares on the ends of the internal shafts. The foot brake consists of two metal shoes contracting on to a wide drum, the outer surfaces of the shoes being grooved to form channels for water cooling when the car is being used in hilly countries. The rear brakes are of the internal expanding variety. The vehicle is well sprung, a transverse spring at the rear supplementing the usual longitudinal ones. Ball bearings are provided throughout except on the engine. The other cars exhibited consisted of a couple of 18-25-h.p. four-cylinder vehicles, both fitted with roomy side-entrance bodies. In general arrangement they follow the lines of the 24-30-h.p. referred to above.

### The "K. D." Motor-Bicycle.

The "K. D." motor-bicycle set made by M. A. Keller-Dorian, of Lyons, France, and exhibited by Madame Lockert, attracted considerable attention. The set consists of a 14-h.p. or 17-h.p. motor, together with all the necessary accessories in the way of tanks, pulleys, driving rims by attaching which to an ordinary roadster safety the latter may be quickly converted into a light motor-bicycle, capable of attaining a speed of from 20 to 30 miles.

### The Corre Cars.

Several of the latest types of Corre cars were displayed by AUTOMOBILES CORRE, LTD., including a two-seater with 8-9-h.p. De Dion single-cylinder engine; it can also be supplied with a tonneau. The general arrangement of the mechanism follows the usual lines of live axle cars. The gear-box is adapted to give three speeds forward and a reverse.

The Corre 12-h.p. car is provided with a De Dion double-cylinder engine the radiator being suspended below the frame, so that the carburettor and ignition apparatus are of easy access, a remark which applies to the change-speed gear and other parts of the mechanism. It may be remembered that it was on a Corre 15-h.p. car that General Booth last year made a 2,500 mile tour in England.

### The Zenith Cars.

THE ZENITH MOTOR ENGINEERING COMPANY showed the Zenith Bi-car. The framework consists of an independent upper and a lower frame, which are connected only at either end, and which together form a spring absorbing practically all ordinary vibration. The lower framework is in front, carried well beyond the axle of the steering wheel, and is connected with the higher by a hinged joint; in the back the connection is made by means of a covered spring, working in a socket, thus preventing any lateral spring in the frame. On the "Bi-car," in turning, the base of the wheel goes outside the centre line of the machine instead of inside, thus—with a very low centre of gravity—avoiding side-slip. The frame is a specially designed horizontal, which, whilst giving great lateral strength, yet by reason of its great elasticity in a vertical direction gives a great degree of comfort in the saddle and freedom from vibration. The 1906 machine of this company is fitted with a 3-h.p. Fafnir air cooled engine and Brown and Barlow carburettor. The steering is effected by means of connecting rods fixed on the ends of the axle and bar at the bottom of the steering pillar, the steering wheel being of unique design. On this stand was also shown the "Zenith popular" two seated car fitted with a 6-h.p. Stevens engine. The construction of the machine is such that the whole of the weight of both riders and of the machinery is carried below the centre of the wheels.

### Everything but the Motor.

As usual, Messrs. ALFRED DUNHILL, LTD., took occasion of the exhibition to bring their varied range of motoring accessories to the notice of the public. In their lamp department special mention may be made of a Duplex lens headlight, fitted with lens and parabolic reflector and a patent double burner, with a low consumption of gas per hour, securing to the motorist a powerful light on an economical consumption. This lamp is also suitable for use with Dunhill's dissolved acetylene. This latter speciality is manufactured without danger on the system advocated by the firm, for which they have obtained the sole British rights. The process is briefly as follows:—The containers are filled with a porous material, soaked with a chemical which has the peculiar quality of dissolving 100 times its own bulk of acetylene gas under slight pressure. As this pressure is released, acetylene is given off as pure dry gas. Users of dissolved acetylene confidently state that

Fig. 118.—Dunhill's Duplex Headlight.

the advantages over the small automatic generators must be experienced to be fully appreciated. Accessories shown at the stand included lamp covers, an acetylene lamp adaptor for paraffin lamp, speed indicators, jacks of every kind, etc. In clothing were several new designs for the season, including the "Loden" smock, a light and handy waterproof coat with sleeves and shoulders finished with silk lining. For motoring attire, chauffeurs' and mechanics' clothes, aprons, and the like were also in the display, which amply justified the firm's claim to supply "everything but the motor."

**Radiators, Etc.**

Long associated with other industries requiring the scientific as well as the mechanical study of cooling appliances Messrs. BENNETT, SONS AND SHEARS, LTD., have gone into the automobile trade with considerable advantage. Their productions have a high finish, everything being characterised by good workmanship and sound material. The new patent honeycomb radiator was an important speciality in the display, this being constructed with a tube plate projecting beyond the tubes and protecting them from damage. In Fig. 119 the projecting tube plate is illustrated as protecting

Fig. 119.—Section of Honeycomb Radiator, showing Projecting Tube Plate.

Fig. 120.—Tube with one form of Patent Continuous Gill.

the tubes and joints. Tubular radiators with various designs of gills are made by the firm, a good type which will not lose shape being shown in Fig. 120. These can be obtained with either vertical or horizontal tubes, and in the specimen on the stand attention was well directed to the cap on the top of the radiator, which was of a novel design and good appearance. A new jointing preparation known as Petroment was also shown, this being put up in collapsible tubes of convenient size, and having well-founded merits.

**The "Albany" Pump.**

On the stand of the ALBANY ENGINEERING COMPANY was the Albany rotary motor-car pump, the special features of which are the absence of valves and the reduction of wear to a minimum. The device is an absolute force pump which can be bolted direct to the frame and requires no close attention. There are only two working parts, and the pump is well calculated to overcome one of the great difficulties with which makers of cars have hitherto had to contend in effecting the cooling of motors.

**The Bentall Engine.**

Messrs. W. G. JAMES AND W. WHITTALL were in the Gallery with a Dupressoir light chassis fitted with a two-cylinder 8-10-h.p. Bentall engine. Various parts of the Bentall motor were also displayed on the stand. Having illustrated and described the Bentall engine so recently as November last, we would now content ourselves with reminding our readers that the construction of the crankshaft is a combination of built and solid crankshaft giving great rigidity, an arrangement which permits the crank to be casehardened and ground, and the connecting rods to be made with solid or adjustable ends. The shape of cylinders enables the camshaft to be brought close to crankshaft and the gearing proportionately reduced in size, thus diminishing the peripheral speed. The low tension ignition is placed in the centre of the cylinders, which secures that the spark occurs in the centre of the charge and gives a more rapid and effective explosion. The low tension system permits of very easy adjustment in timing of the spark. The advancing or retarding device is very simple, and not likely to be affected by considerable use. The movement is effected by means of a nut with left and right hand thread, which, when partly rotated, lengthens or shortens the rod carrying the spring pawl that actuates the trips; in this manner the electric circuit is made or broken earlier or later. The same nut, by means of a simple clamping device, can be used to permanently adjust the spark for any position. The plug carrying the ignition tappet in centre of cylinder can be easily removed, and its removal in no way affects the adjustment of the sparking. The same conditions apply also to the bracket on top of cylinder which carries the trip catch; in fact, the whole of the ignition mechanism can be removed without needing readjustment when replaced. All the moving parts on ignition are padded to reduce noise. The construction of crank case permits the removal of bottom cover, giving a clear view of the whole of the mechanism, including gearing and governors. The lubrication is on the splash system. Regarded as a whole the Bentall engine is a good specimen of British workmanship.

**A Novel Petrol Motor.**

Messrs. A. LEGE AND CO. exhibited an unusually novel and interesting type of petrol engine, a full description of which will be given in an early issue. There was also shown at the same stand the Smitt patent change-speed gear, in which the pinions are always in mesh. It is designed to give three forward speeds and a reverse with direct drive on top speed, the various pairs of pinions being made to transmit the power by means of a sliding shaft having eight projections or feathers formed on it, which can be brought into engagement with corresponding recesses in the bosses of the loose pinions.

**Motor Oils.**

Messrs. GRINDLEY AND CO., LTD., to the value of whose oils for automobiles we made reference last November, were present with a collection of their motor oils as used on many of the London motor-omnibuses. White solidified oils, graphite grease, anti-rust, and other specialities were also on exhibition, as well as the Pioneer brand of oils for motor cylinders and bearings.

**Lamps.**

Messrs. L. RIPAULT AND COMPANY had a good show of Oleo plugs and terminals, a novel form of collapsible lamp for handy service also attracting visitors to their stand. Several imitations of these plugs having been put upon the market, the makers have decided to add to the mark Oleo a sketch of a negro's head—and by this distinctive sign the plug will be known.

**The High Tension Co.**

On their stand the HIGH TENSION COMPANY showed a six-cylinder 20-h.p. marine petrol engine as well as other sets of four, three, two and one cylinders of 12, 9, 7 and 4 h.p. respectively. There was also shown a well-designed six-cylinder chassis. A new coil for the latter was also on view, a practically perfect insulation being given by the winding being in sections.

**The G. B. Specialities.**

The letters "G. B." signifying "Gordon Bennett," have been adopted as trade marks by the COUNTY CHEMICAL COMPANY, LIMITED, which showed its specialities in the Gallery. These included several good lines in oils and greases, including a motor grease with a high melting point; a motor-oil of non-congealable constitution; carbide for use in motor lamps, and recommended on account of its economical qualities; a chain lubricant for reducing friction; a car polish for imparting a lustrous polish to the varnished parts of automobiles; and an accumulator repair outfit containing everything necessary for the repair of celluloid accumulators. In addition to these specialities, the company also exhibited their G. B. vulcanisers, which have been already described in the *M.C.J.*, and the merits of which are being generally recognised by motorists.

**A Buttonless Coat.**

Messrs. HAWKES AND CO. had a distinct novelty in motor clothing—viz., a coat without buttons. This is known as the "Swinhoe," and is absolutely impervious to wind and rain. It is kept in position with one strap, which is secured on to the ordinary jacket. The collar is also a special feature, closing at the back, and entirely securing the wearer against the vagaries of the weather. When secured on the wearer the coat has the appearance of an ordinary garment of good design, while the ample skirt allows for the comfort of the motorist when sitting. Doubtless many visitors will preserve the set of illustrations with which Messrs. Hawkes and Co. made clear the ingenious ideas embodied in this garment.

**A Nut-Lock.**

SPERLING'S NUT-LOCK, LTD., attracted attention to the useful speciality indicated in their title and illustrated in the accompanying views. The washer (Fig. 121) is placed on the bolt and the spring plate put on and screwed down into the position shown in Fig. 122, pins in the washer being pressed into the workplate by the pressure of the nut. It is claimed that the use of these nut-locks saves at least 50 per cent. on the usual method. The loss of nuts and bolts is also avoided. The main point is that as wear takes place on the car or machinery, the nut can be tightened up in the ordinary way and is firmly locked where

Figs. 121 and 122.—Details of Sperling's Lock-Nut.

left, thus retaining the adjustment, avoiding rattle and wear of parts adding also to the sweet running and life of machinery. Motor-car and wagon builders recognise the invention as securing safety in wear and exactitude in adjustment.

The ACCIDENT INSURANCE COMPANY, LIMITED, had a stand from which to issue prospectuses relating to their motor-car insurance policies, which have many points of interest.

Mr. ALFRED DUNHILL made a large display of a single article, this being a patent shield pipe of stylish appearance, and possessing merits likely to be appreciated by motorists to whom the pipe does not lose its fascination even when on the car. This particular form of smoking medium has a shield which prevents the inconvenience and danger associated with flying sparks or ash to the smoker or his companions when motoring. Its features are simple, but none the less commendable on that account. To many it will prove a close friend.

**Prested Specialities.**

Among the specialities shown by the PRESTED MINER'S LAMP COMPANY, LTD., was a sparking plug with interchangeable parts, and no cement to work loose. The plug requires no packing and with its use short-circuiting is prevented. There was also on view a multi-cylinder coil in which all the coils are quickly detachable. A new switch, tail lamps, charging boards, etc., completed an interesting exhibit.

**Motor-Car Houses.**

Not everyone is in the happy position of having a specially-built motor house; such would be well advised in inspecting the motor-houses designed and constructed by Mr. A. Rossi, who makes a feature of the erection of such houses where they may be required temporarily or permanently. They are built in sections, which are bolted together and easily removable from one place to another as occasion demands. The floor is well raised above the ground, and the general design has been well prepared with a view to the requirements of motorists who do not happen to have a permanent structure.

**Carriage Work.**

Amid a good display of carriage work on the stand of the VICTORIA CARRIAGE COMPANY was a limousine body fitted to a 24-28-h.p. Leon Bollee car with a removable top. This firm are one of the pioneers of this form of adaptable body for motor-cars, and, as it affords either a closed or open carriage, its advantages are obvious. In both cases it is not apparent that the body can be so adapted, so finished is its appearance.

**Nickell's Terminal Nut.**

A new combined terminal end and electrical nut has been introduced by Mr. F. F. NICKELLS, whose tell-tale rear lamp has done something to ease motorists of a minor worry. The main points of the terminal end and nut exhibited are a brass stirrup provided with three metal strips. Near the ends of the three latter holes are bored so that when the ends of the stirrup are brought together all three holes are in line and they can be slipped over the threaded portion of the terminal. A spring near the top of the stirrup tends to force the extremities of the strips apart, with the result that the terminal nut is held firmly in position, the device constituting a useful accessory for motor-cyclists.

**Name Plates.**

Although tardy in arriving at the show, the STANDARD METAL ENGRAVING COMPANY made an effective display the last few days, their specimens of name plates for automobiles of great and small degree being remarkably well done and illustrating the favour with which their work is regarded by many of the leading makers of cars, both at home and abroad. They are made in a flexible metal and can be turned out in any design, the company having facilities for work of a very complete kind.

**Fire Extinguishing Appliances.**

Messrs. F. B. HILL AND COMPANY, LTD., were in the gallery with a selection of their fire extinguishing appliances, fire buckets, hand grenades, etc. Hitherto these have been chiefly used in connection with buildings, but now they are available for use if required on the road. A small form of extincuteur is made which can be carried on a motor-car, and is therefore available should any necessity arise. It is made in a handy form of two gallons capacity, and is strong, light, and sold at a reasonable figure, weighing only 29 lb. It is guaranteed to instantly extinguish burning oil, tar, and other highly inflammable materials, and will throw a chemical fluid a distance of 30 to 40 feet.

**Lifts.**

THE hydraulic motor-car lifts made by Messrs. R. WAYGOOD AND CO., LTD., have become familiar in garages and showrooms; the display made at the exhibition should further popularise these excellent productions in the automobile industry. There was a model of an automatic push button electric lift and also examples of other productions of the firm. Their electric motor-car lift is worked with push buttons and fitted with safety appliances, while their hydraulic motor-car lift is also quiet, safe and reliable. It is suitable for any position and is made to suit any weight, height, or size, or to work from any pressure.

**Wheels.**

Of particular interest to those concerned with the development of the heavy vehicle was the exhibit of Messrs. STAGG AND ROBSON, LTD., who had on their stand a double-decked omnibus body of pleasing design and good finish. A selection of patent rim wheels suitable for such vehicles, and built to the order of the London Omnibus Company, attracted much notice. The exhibits were arranged in various stages of manufacture, so that an adequate notion of their construction could be given to visitors. The firm's patent rim principle of manufacture is already well known, and one of such specialities but with loose strakes formed a central feature of the display. Should the strakes require renewal the facility of application will be found a great advantage. The patent omnibus pocket wheel is also adaptable for light motor-cars. The rim being entirely of steel or malleable iron, there are no fellows to shrink. Any of the spokes can be replaced at any time without disturbing the rest of the wheel.

**The Adams Motor Jacks.**

The useful lever jack for removing motor-cars from one spot to another introduced by Messrs. H. ADAMS AND CO. seems to meet with increased favour at each show. Having previously been fully described

in our columns, a further word of commendation is all that the present occasion seems to demand. The new portable elevator, however, calls for further mention. This elevator is constructed to receive any size or weight of motor-car, which can be drawn on to the elevator by the means of two wire ropes running over two geared drums. The wheels of the car, running in two steel channels, are secured when in position by three strong leather straps, as well as the ratchets on the drums, therefore in quite a safe position for repairs or examination of undercarriage, etc. The elevator is also fitted with a large extension screw, running through the centre, thus enabling the user to extend the framework of the elevator to suit the width of any type of car. The elevator is mounted on iron wheels in the centre of the framework, as well as two strong castor wheels on the end of channel frame, thus enabling the user to transfer a car to any part of the workshop or garage, and permits the car to be turned round as though on a turn-table. The advantages of the apparatus are easily apparent.

**Imperial Tyres.**

THE IMPERIAL TYRE AND RUBBER COMPANY, LTD., required two stands on which to display their goods, these including Imperial tyres of every description with plain treads, grooved rubber treads, and studded non-skidding devices. There was also a full range of tyre repairs in which direction the firm have acquired considerable distinction these last few years. One good exhibit was the Imperial detachable non-skidding tyre protector, which is said to secure a desirable combination of strength, simplicity, and efficiency. This device is self-adjusting, the inflation of the tyre setting the non-skid in its proper position, and adjusting it to the exact size and shape of the type. A perfect grip is secured and there are no metal attachments to damage the surface. This speciality of the Imperial Tyre and Rubber Company, Ltd., can be fitted to any section of tyre.

**Launch Engines.**

Of special concern to those who are following the progress of the automobile movement on the water was the exhibit of the MAIDEN HEAD MOTOR AND ENGINEERING COMPANY, which consisted of single and twin-cylinder launch engines, sirens, water-cooled silencers, reversing propellers, and fittings for motor-boats. The special point of the company's specialities in engines consists in the fact that the engine, carburettor, pump, thrust block, and flywheel guard are built up on a substantial cast-iron angle frame, ensuring the maximum of portability consistently with strength and perfect alignment. These engines are known as the Endean, and are made in 3, 4, and 6 h.p. single-cylinder, and 6, 10, and 12-h.p. twin-cylinder sizes.

**Smok-ett.**

Messrs. HOARE AND SONS were doing much to popularise "Smok-ett," the registered name of their new rain coats for motoring. They had a good range of such specialities on view, the Aquatecta slip-over being an admirable device which has already won a place in the motorist's wardrobe. A full range of the firm's specialities in liveries for chauffeurs as well as motoring costumes for ladies made up an effective section of a very representative display.

**New Motor Screen.**

The special exhibit of the SAFETY MOTOR SCREEN COMPANY, LTD., was well calculated to arrest attention, seeing that it went far to overcome the objections sometimes raised against such devices. The invention is a combination of glass and celluloid, a sheet of celluloid being cemented between two sheets of glass. The compound safety screen is as clear as glass and cannot be distinguished from good plate glass. In the event of the compound safety screen being broken the pieces of glass adhere to the celluloid and cannot become detached. So strong is the material that a brick thrown at it will rebound off it, whilst it is absolutely fireproof. From all we can hear the screen is likely to be frequently seen on the road during the coming season.

**Detachable Bodies.**

Having so recently as November last fully illustrated and explained the idea underlying the Windham sliding detachable motor body placed on the market by the company in which that title is incorporated, there is no need for lengthy description on the present occasion. The cars fitted with the bodies proved well fitted to demonstrate the ingenuity of the idea by means of which one chassis can be readily adapted to various purposes.

**The Crossley Motor.**

The Crossley 22-28-h.p. four-cylinder motor was shown in the gallery by Messrs. J. S. CRITCHLEY, LTD., who are the sole factors for these motors. The cylinders have 4½ in. bore by 5½ in. stroke, notable features consisting in the specially long bearing and mechanically-operated valves. The display of various parts of these motors was a useful addition to an interesting exhibition.

**Fire Extincteurs.**

The collection of "Favourite" chemical fire extincteurs in various sizes from one gallon to five gallons made by Messrs. SINCLAIR AND COMPANY was of interest to many visitors, these being handy and conveniently designed for use in garages, motor works, etc. The assortment of fire appliances was practically exhaustive of everything required in an automobile establishment for the conquest of incipient fires. A speciality was a self-acting chemical fire engine capable of successfully extinguishing burning petrol. It is claimed that one gallon of the contents of this apparatus will be of greater efficiency than twenty gallons of plain water.

### The Polkey Lamp.

A large stand was occupied with lamps made by Messrs. GEORGE POLKEY, LTD., whose productions have the distinction of British origin. The firm devote their skill and facilities for the construction of a good style of lamp to the paraffin and combined paraffin and acetylene types, several designs of both classes of lamps being on view and attracting much attention. The firm's "convertible" headlight is becoming a favourite type with many motorists, while their large headlights have a solidity of construction as well as brilliance of illumination that is combined in a really notable lamp. This firm also showed the Sampson acetylene lamps, giving up to 2,000 candle power.

### Accessible Batteries.

A large selection of electrical devices, such as ammeters, voltmeters, ignition coils, hand lamps, ignition distributors, charging apparatus, and the like, served to introduce the ACCESSIBLE BATTERY AND ENGINEERING COMPANY to the notice of the motoring public. A novelty on the stand was an accumulator which can be taken to pieces when it is desired to clean or replace the plates. The cover is fixed by screws and can be readily removed and fastened down, so that they are entirely proof against spilling.

Reference has already been made to the splendid debut made by Messrs. SAYERS AND CO., whose carriage work was of good design and fine finish, the body fitted to a Unic chassis being a notable exhibit. Among the minor departments of the display were the Vuitton trunks that can be supplied to match the colouring of the car itself and the Sayerico tyre brackets, by the use of which the carrying of the spare tyre is made an easy matter. This is attached to the car, forming a neat attachment and assisting the general appearance of the vehicle.

Messrs. H. G. NICHOLL AND CO. made a good display of ladies' and gentlemen's motoring raiment, including rainproof frieze motor-coats lined with leather, wool, or fur. Their "Quicksilver" rainproof overall motor coats have special points so far as elegance and quality are concerned, and special mention may be made of the wrap coats in a new Nicoll cloth of pure wool in which "warmth without weight" is said to be secured.

Messrs. H. M. HOBSON, LIMITED, showed the Jenatzy tyres, the excellent quality and wearing capacity of which is claimed to be one of their great merits. The construction of the tyres is based upon the practical experience of Jenatzy. A novel tyre at the stand was one intended for motor-bus service, canvas and metal alternating around the rim and providing an apparently durable and non-skidding form of tyre.

The gas engines in the Hall included one of Messrs. KYNOCH's engines and producer plant with a direct coupled dynamo, the electricity generated being used for lighting the stand, and also the "National" horizontal type of gas engine and suction gas plant made by the National Gas Engine Company.

Messrs. WEINBRENNER AND CO. were somewhat late in taking up their stand, but once in position their metal engravings for use on motor vehicles, etc., attracted considerable notice. They are well finished and clearly lettered, affording makers of cars the opportunity of labelling the same in neat style not detracting from the general appearance of the vehicles.

A display of launch engines was made by Mr. F. C. BLAKE, who has devoted much study and experiment to this department of automobilism. One of the types shown was of 25-35-h.p., with mechanical valves arranged on opposite sides; others were of 6-h.p. two-cylinder and 16-h.p. four-cylinder respectively with automatic valves. On the stand there was a four-cylinder high-tension distributor and a good selection of Baseley's brand of Engelbert's oils—pure hydrocarbon mineral oils of a high grade of quality.

The Securitas combined pneumatic and solid tyre was shown by the UNITED KINGDOM MOTOR TYRE MANUFACTURING COMPANY.

The MIDDLETON PNEUMATIC HUB SYNDICATE, LTD., drew attention to their special device for securing the easy running of automobiles, an ingenious idea already fully described in our columns and recognised as a practical device by many motorists of note.

SHARPE'S UNIVERSAL PATENT COMPANY, LTD., made a feature of their silencers, now made applicable for all classes of automobile work—on land or water. The "Universal Victoria" air-cooled silencer for motor-cycles has now two expansion chambers in one casting; otherwise the system of cooling and treating the exhaust gases is precisely the same as has long proved acceptable in these devices. The makers of these well-known silencers are making their works of general interest to motorists, and now undertake all classes of repairs to motor parts as well as a "universal" agency for the convenience of car owners at a distance.

Messrs. J. C. LYELL AND COMPANY, LTD., showed the Crepet gear, which has the advantage of being always in mesh owing to the provision of a sliding keyway. The "Universal" non-skid detachable tyre protector was another exhibit of interest. This can be removed from or adjusted to the tread of the tyre and will fit every diameter of tyre and every circumference within a variation of one-eighth of an inch. It consists of a band of chrome leather carrying the outer plates of case-hardened steel and is fixed to the rim by means of steel hooks. The spare sections, which are about thirteen inches in length, can be made to serve as gaiters, thereby obviating the necessity of carrying a repair outfit on a journey. As an economical as well as efficient protector this device merited special notice. The "Lemale" self-starter, sparking plugs, lamps, tool kits, etc., made up a comprehensive display.

The "PHOS" COMPANY had a show of their patent convertible motor-car lamps for use with either special carbide cartridges or ordinary loose carbide, as well as of acetylene gas burners of every description for automobile use. This company is specialising in such work, and their exhibit revealed a close acquaintance with the requirements of motorists.

Messrs. J. C. FULLER AND SON had a large representation of their electrical specialties, including ignition apparatus, batteries, omnibus lighting batteries, head lights, tail lamps, etc. The Fuller motor capsule electric reserve was on the stand, this being a form of dry ignition battery which can be kept in stock without depreciation for a considerable time. When required for use the cell has merely to be punctured; it is then immediately available for working the coil. These cells, which should add much to the comfort of motorists on tour, are made in three sizes, for motor-cycles, tri-cars, and touring cars. We are assured that the battery will remain effective for any length of time. The Syntonic coil was also shown in an improved form, and altogether the display was a very notable one.

Mr. J. A. RYLEY had a large exhibit of specialties for motorists, including the "Perfect" switch, the "Vita" sparking plugs, Eclair coils and the Ryley non-skid, the latter of which has been recently illustrated in our columns. The Eclair coil can be obtained fitted with the Mutax fixed or detachable tremblers, which are remarkably fast and reliable.

THE COWEY ENGINEERING COMPANY, LTD., made a good display of their patent speed recording indicators, in which scientific accuracy is combined with excellent workmanship.

Messrs. GEIPEL AND LANGE made a special feature of the Vulcan speed indicators, which are electrically operated instruments consisting of a magneto dynamo driven upon the front wheel by means of aluminium pulleys and rubber band. The current generated by the dynamo is proportional to the speed of the wheel from which it is driven. Electricity is conveyed by flexible wire to a hot-wire voltmeter, which can be situated upon the dashboard, or other convenient position. The indicator is made with 2 in. or 4 in. dials respectively, and the range may be 45, 60 or 90 miles per hour. A distance recorder of novel construction being fitted outside the front wheel to the hub-cap, to which it is permanently attached, was also shown in the Vulcan odometer. The drive of the odometer is perfectly central, and does not depend upon star wheels or strikers. The fixing to the hub-cap can be carried out readily by any mechanic. The dial of the odometer shows miles and 1-10th miles reading up to 9999.9 miles and then repeating. Below this is a set of five dials which can be set by hand, enabling the distance traversed at any time to be ascertained by subtraction. Vulcan auto tremblers were also shown, consisting of a high speed trembler arranged to be placed in series with any existing coil and giving the advantage of a high speed trembler instead of any slow or defective trembler which may be fitted to the existing coil. The new type of Vulcan auto tremblers are furnished with condensers which involve the fitting of two wires only in the place of four as formerly.

The system of the insurance of motor vehicles at LLOYD'S was explained in the Arcade by Col. D. A. Kinloch, from whom full particulars could be obtained of the policies against accidents of all kinds, third party claims, fire risks, including explosion and self-ignition, theft, and burglary.

Another insurance company represented at the show was the CAR AND GENERAL INSURANCE CORPORATION, LTD., which specialises on motor-car, motor-cycle, motor-lorry and similar insurances, while also effecting insurances in connection with accidental hazards of all kinds.

Many good designs in the well-known "Omne Tempus" rainproof cloth were to be seen on the stand occupied by Messrs. SAMUEL BROS., LIMITED, who have given special attention to the requirements of motorists—both ladies and gentlemen. They gave an interesting demonstration of the rain-resisting and porous qualities of their cloths, which have been adopted in the improved "Romeoter" coat. This is also made in Irish frieze, Scotch tweeds, and leather. Boots, gauntlets, aprons, caps, etc., added to the variety of a useful display.

Several excellent specialties were shown by the GRAPHOLINE MANUFACTURING COMPANY, LTD., their manufactures including clothing in furs, frieze, and leather. The "one minute" series of levers for removing tyres were on this stand, as well as the Bruck solidified oil and Grapholine for chains.

THE SEDDON TYRE COMPANY showed the Reddaway-Seldon motor tyres of both the beaded edge and tubeless patterns. These have been previously described in our columns; we may now add, however, that the tubeless tyres can easily be fitted to existing wheels by removing the rims and attaching the flanges to the felloes.

Among the novelties on the stand of the INVENTORS' AND INVESTORS' CORPORATION, LTD., was the "Instra" warmer, a device for placing within the muff or in the pocket for warming the hands. It is also fitted with a safety attachment for hanging outside the coat. To ladies motoring in cold and wintry weather it will prove a boon, and all who travel will recognise the value of the warmer. On this stand Brown's "Rolledge" motor-car polish was being exhibited, this being an excellent preparation recently referred to in our columns.

Messrs. JOSEPH KAYE AND SONS, LTD., showed their oil cans in copper, brass and steel, their "forced feed" or "pump" lubricating oil cans, improved oil economiser and other specialties which they have familiarised among motorists at these Agricultural Hall shows.

THE Desclee non-skidding tyre with its renewable metal treads and easy capacity for repair was exhibited by Messrs. G. DESCLEE and Co.

[ Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, W.C.]

### SPARKING PLUG POSITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Herewith I send you a sketch in section of one of my motor-car cylinders, by which you will see that the sparking plug is fitted in the top of the dome. This places the sparking point of the plug some distance away from the compression chamber and causes misfiring sometimes, especially when the sparking points are a little foul. Is this plan a good design, as I see most of the new engines have the sparking plug

fitted near the inlet valve, and the compression chamber very much smaller in comparison to the one shown? At every compression stroke the recess up to the sparking plug has to be filled and also exhausted from there after the explosion, but when the engine is running fast it often misfires. Would I gain more power if I filled the space up and brought the sparking point into or near the top of the compression chamber? I could do this by taking the present nut out of the recess and tapping the recess with a new thread through and fitting a new plug from the inside of compression chamber. I could also reduce the cubic capacity of the compression chamber if it would be a further gain. Another plan would be to fill up the recess and fit the sparking plug in the recess between the automatic inlet and exhaust valves, but this would mean drilling a hole through the water space of the valve recess, which probably may leak unless carefully done when tapping and fitting the nut for sparking plug. I shall be deeply grateful if you can advise me what is best to be done in this matter, as I am sure I do not get the full power out of my engine. The compression when turning by hand is only about 45 lbs. on the test gauge even after fitting new rings to the pistons. The engine does very fair work, but I think it should do better and be more economical in petrol, which is now very heavy. Can you inform me were I can get sparking plugs with long sparking points, say 1½-2 in. or so?—Yours truly,

SNAVE.

[The sparking plug as shown in our correspondent's sketch is without doubt too high in the cylinder head. The best position for the plug is

near the inlet valve, but this, in "Snaves" case, would be difficult. We would advise fitting a hollow plug in the cylinder head, as per drawing appended, and using a box spanner for the sparking plug. This would also raise the compression somewhat: but the low compression may be due to fitting new piston rings, these not generally being gas tight until

after a little running. If the sparking plug is placed further into the cylinder head no doubt the difficulty will be overcome. We understand that a sparking plug with extra long points is supplied by Messrs. Osborn and Lord, 6, Great Marlborough Street, London, W.]

### THE COST OF EXAMINATIONS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Being a reader of the *M.C.J.*, I am pleased to see your note commenting on part of the speech given by the Hon. Arthur Stanley, M.P., to the members of the Motor Union at their annual meeting held at Cordingley's Show. While I agree with your suggestion that something should be done to reduce the club's charges for examination, I fail to see your argument that the time is not yet ripe for the licensing authorities to take the matter in hand. In the event of the licensing authorities taking the examination question up, what will be the worth of the certificates of the Automobile Club of the present time? When the time comes for the Government to take over this examining problem, car owners, manufacturers, and, in fact, all persons employing a man to drive their car, will catch the certificate fever again and insist on the man having a Government certificate; the Club certificate will then be no use whatever to the driver, even of no more value than those issued by the so-called "Motor Schools."

It would be an interesting point for all motor drivers to know when and where this examination and certificate business will end. A man just entering the trade in most instances seeks his first vague knowledge at one of the numerous motor schools, for which he pays anything from £5 upwards, and sallies forth at the end of about a fortnight or so a full-fledged mechanic-driver with a certificate to that effect; he then finds the advertisement of the Automobile Club certificate staring him in the face, and comes to the conclusion that he will not be in the running unless he has that certificate also; it is now likely that by the Government taking the thing up he will have another chance of procuring another sheet of paper with "We beg to certify," or something of the sort, with an imposing looking seal in the corner. It is quite evident that before long a motor driver will be able to obtain certificates quite as easily as summonses for exceeding the limit, and, if the man be a mechanic, he will soon come to the conclusion that by the time he has finished dipping his hand in his pocket he would be far better off back in the shops earning a certain 10d. per hour or so.

Quoting the report of the Motor Union's meeting, it is the contention of the Hon. Arthur Stanley, M.P., "that once a certificate of proficiency was granted by the Government it would be difficult for them to take it away, whereas the Club and Union could say to a man whose conduct has proved objectionable, 'You may be a skilful driver, but you are not the sort of man who is a credit to automobilism, and we shall have you no longer on our register, as this is the only way we can put down indiscreet driving.'" Does the hon. gentleman think for a minute that a body of men are going to place themselves under the thumb of any body or concern other than a Government body without having a word to say on their own behalf or in their own defence?—Yours truly,

ARTHUR R. IVENS.

[Our correspondent apparently does not differentiate between the value of the certificates issued by the A.C.G.B.I. and those of the private motor schools. The latter have no status, whereas the former have the seal of an authority which all recognise as competent to deal with the matter from an independent point of view. Until the Government takes up the question—which will assuredly not happen in the near future—it is well that there should be some acknowledged body of known repute granting certificates after adequate tests.]

### THE DIXI CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to "Ex-cyclist's" letter in the *M.C.J.*, I have a 12-15-h.p. four-cylinder "Dixi" car, fitted with a canopy top, glass front, etc., purchased in January, 1905. With regard to the horse-power, this, I believe, has been purposely understated, as my car will climb any of the south coast hills on the top or second speed, and I know of many cars of greater reputed horse-power which are unable to climb them except on the lowest gear. The cost of upkeep is extremely moderate, and if proper attention is given, the engine, etc., lubricated and cleaned, the clutch occasionally looked to, and the carburettor adjusted, there is no trouble. With a full load of five persons the car will average twenty-five miles per hour.

I have at present coil and accumulator ignition, 810 by 90 tyres, and the water circulating pump at the side driven by the flywheel, but I notice that the 1906 models have high tension magneto ignition, 815 by 105 equal wheels, and the pump brought on top of the engine side arms, which I think are improvements.—Yours truly,

LESLIE WALTON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Ex-cyclist" in your issue of the 7th inst., I have a 14-17-h.p. four-cylinder 1905 Dixi car, and think it a most delightful vehicle for a lady to drive. I bought it in August and at once started for a tour through England and the Lake district. I had no difficulty whatever. From Scotch corner to Penrith over the hills it ran with hardly any changing of gear being required. It was a severe test, as there were five persons in the car and all their luggage on behind. There is no doubt the car can average twenty-five miles an hour easily on a

hilly road. With regard to economical running, I have just returned from a week's tour over the Chiltern, Cotswold and Mendip Hills, and the average consumption for long runs was about twenty miles per gallon of petrol. Durandal non-skids are fitted to the driving wheels, which undoubtedly save punctures and lengthen the life of the tyres, but, the car being a fairly light one, the upkeep is extremely moderate. There has only been one puncture since I had the car, and that was in the yard at the end of the journey.—Yours truly,

S. E. CAMPBELL VON LAURENTZ.

### SIX-CYLINDER CARS AND THE PUBLIC.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The six-cylinder controversy has reached a very interesting point, and is well worth discussing. A large number of people who represent the buying public have become very enthusiastic about six-cylinders, some, indeed, who have never tried them, but we must not lose sight of the fact that a "ring" is being made round the six-cylinder car, and it is in certain quarters being boomed for all it is worth. If we look into the question carefully it is easy to see why this is the case: the cost of production of the six-cylinder is not a great deal greater than that of a four-cylinder; it certainly does cost more, but the extra cost is out of all proportion to the price asked for it. Six-cylinders provide excellent talking points and they have many advantages—a few real ones, a great many imaginary. Without going

### WARNING MOTORISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The police in my district have lately been very active against motorists. The other day I warned the drivers of some cars that were passing as to the presence of the police in the district, and they were, of course, very careful afterwards. I have been told that warning motorists in this way is a dangerous proceeding. Can you tell me through the *Journal* if I am likely to get into trouble for helping my fellow motorists to avoid trouble?—Yours truly,

J. J.

[Our correspondent is referred to our Comments on this matter in the last two issues. Meanwhile, the decision of the magistrates in the Norbury case is being awaited with interest, not to say anxiety.]

### LOW TENSION IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As far as my experience goes, I can endorse all that "Tally-ho" says re the above, in the *M.C.J.* of the 7th inst. I have been running a 6-h.p. car fitted with a low tension magneto for three years, which has given me no trouble whatever, and which is now working as well or better than when new.—Yours truly,

SOUTH T.

The Motor Hose and Service Wagon used by the Fire Brigade at Nancy, France.

The Chassis was supplied by Messrs. De Dietrich and Co., the equipment being furnished by Messrs. Morin-Gugumus, a French firm of fire-engine builders in conjunction with M. Drouville, the De Dietrich Agent in Nancy.

into the theory and practice of the six-cylinder, it may be said that a six-cylinder engine is in some respects superior to the four-cylinder, but it takes an expert to discriminate between a six-cylinder and a good four-cylinder, and consequently the advantages are not worth the extra two cylinders, with their attendant trouble and upkeep, and they certainly are not worth the extra price demanded.—Yours truly,

C. A. R.

### MOTOR WAGON v. HORSE HAULAGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having run a Foden steam wagon for two years and three months, the results have been so satisfactory that we have decided to order another. During the first seven months we kept a fairly accurate account of the saving over horse haulage, and came to the conclusion that the car had saved its full original cost. During the whole time we have had it we do not think the car has stood idle more than two weeks in a year for repairs, and it has travelled at least 164 miles a week, with an average load of 7 tons, at a cost of £5 per week, as against £30 16s. by horses. In other words, the 77 tons per week carried fourteen miles, costing £5 by motor, costs us by horse 8s. per ton, and often more, a total of £30 16s. Neither do we think the cost of repairs exceeds the cost for repairs to vans and harness required to do similar work.—Yours truly,

BOWRON BROS.

MUDGUARDS FOR TRI-CARS.—In reply to "Newport," who enquired for the makers of mudguards for tri-cars and quads, we learn that these can be obtained from the A. G. Mulliner Motor Body Company, Ltd., Bootle.

### MOTOR CYCLING CLUB.

THE Motor Cycling Club is holding a hill-climbing competition for motor-cycles on the 5th prox. Competitors must present their machines at the "Old Salisbury Arms," High Barnet, where the riders and machines will be weighed, and the machines sealed between 3 and 4 o'clock. No machine can be weighed after 4 o'clock. The actual hill upon which the competition will take place will not be made known until after the sealing has taken place.

A run to Edinburgh is also being arranged by the club.

### NEW COMPANY REGISTERED.

NEW LEADER CARS.—Capital £75,000, to acquire the business carried on by the New Leader Motors, Ltd., at Nottingham and elsewhere. First directors Messrs. F. Goodenough, A. R. Grimdsdale, D. H. Grimdsdale, and T. B. Watkinson, £500. Aspley Motor Works, near Nottingham.

## THE CARE OF CLUTCHES.

—♦—

It is impossible to emphasize too strongly the fact that the breakage of parts, the wear and tear of a motor-car as a whole, and its consequent general depreciation, are due in a much larger measure to the sudden shocks to which the vital parts are subjected than to the natural wear resulting from the constant transmission of power from the engine to the tyres. The shocks due to sudden application of the brakes severely tax the frame construction, but the shocks of improper clutching affect also the power mechanism and are, therefore, of even more serious consequence.

Defects or disarrangements in clutches reveal themselves in two different ways, either by gripping or seizing of the clutch, or by what may be called "spinning." Clutch defects may be classed accordingly, as the two phenomena are due to entirely different causes and affect the transmission gear differently. When the clutch "grips," it is impossible to engage it gradually; the power is therefore applied suddenly, and a blow delivered to all parts along the line of transmission. In the majority of cases, poorly-designed controlling mechanism is responsible for this condition of affairs. It should be possible to permit the clutch to engage very gradually, so that it slips at first, and grips tighter as the car accelerates. To do this, it is necessary that there be a liberal amount of movement of the pedal, so that a considerable amount of time, comparatively speaking, is occupied in making the engagement, and at the same time a sufficient leverage secured to make the physical effort required small and therefore more steadily applied. There should be no looseness in the joints, nor any "give" or springing, either in the levers or at the fulcrums, for as the amount of movement between the engaging surfaces is necessarily small, it is essential that the means of obtaining it be absolutely positive.

With a perfect operating mechanism it is possible to engage a clutch easily and without gripping, no matter what the tension on the spring may be, within, of course, certain reasonable limits. However, controlling devices are not all perfect, and it may, therefore, happen that excessive spring tension causes a clutch to grip, while a tension just sufficient to meet the normal demands of driving could be easily controlled and would permit gradual engagement of the frictional surfaces. In this connection it may be said that the proper tension on the clutch spring should be made the subject of careful study. Too great a tension may not only lead to the trouble indicated above, but will also cause excessive wear on the thrust bearings and on all parts of the controlling mechanism. The clutch should act as a safety device, to an extent; it should, of course, be capable of transmitting sufficient torque to drive the car up the steepest hill, which the power of the engine will enable it to climb, yet it should slip when a heavier shock is delivered to it, and thereby prevent this shock from reaching the breakable parts of the transmission. Generally speaking, a sufficient spring tension is, considers a writer in the "Horseless Age," that which will permit the clutch to slip very slightly when the car is climbing a grade which taxes the engine to its limit when the highest speed is in use.

Gripping may also be caused by an improper condition of the engaging surfaces. If they are both metal surfaces, the lack of sufficient oil between them may prevent the slipping necessary to effect an easy start. It would also tend to aggravate the gripping by roughing the surfaces. If leather and metal are employed, the cause of the trouble usually is that the leather has become dry and rough through lack of care. Water and petrol should not be allowed to reach it, as they help to dry out the oil held in its pores. Petrol will accomplish this very quickly, while water may have just as bad an effect in the end although it does not act so rapidly. The heat generated as one surface slips over the other also tends to dry out the oil, and if a car has been operated for some time with a slipping clutch, a careful inspection of the surface of the leather should be made to ascertain whether the heating has dried it up to any extent. If this is not done, the clutch may grip when the spring is tightened.

There are a number of different recipes for clutch leather dressing which are recommended by motorists of experience, but castor oil is most generally used, sometimes mixed with equal parts of glycerine. In either case it should be applied in limited quantities. Machine oil should never be used, as it is not so readily taken up by the leather, and will allow slipping under a higher spring pressure than is necessary if the surfaces are in perfect condition. In applying the dressing, it is better to use a small brush, as if it is poured on it is not likely that it will distribute evenly, and as a result some portions of the leather will receive too much and others not enough. The driving effort should be distributed evenly around the periphery of the clutch, which can only be the case if the engaging surfaces are uniform at all points.

"Spinning," as we have called it, is the continued revolution of the driven member after it has been disengaged. It results in a series of sharp, hammer-like blows to the gears (if of the sliding type) as they are brought into engagement, which tends to chip and burr the teeth, and, what is a less serious matter, to create considerable noise. Spinning may be caused by faulty design, defects in construction, or by improper adjustment. In some cone clutches the rim of the driven member is very heavy and of considerable inertia, and when disengaged continues to revolve much longer than is desirable. In this case the part of the operating mechanism which bears directly against it should be so designed that it acts as a brake and retards the revolving part when the

latter is disconnected. Another cause of "spinning" is failure to cut the driving power off entirely, either through lack of sufficient movement between the surfaces to permit them to clear each other, lack of proper lubrication, too tight a bearing or bending of the clutch shaft, which causes binding between the two members. It is well to note carefully the action of the driven member when suddenly withdrawn from the driving member while the engine is running at a fair rate of speed and no gears are in mesh. If it is in perfect condition, it will stop almost instantly. If it does not stop, a careful investigation should be made to learn the reason. Upon the free action of the clutch, more than upon any other thing, depends the successful operation of a good sliding gear transmission.

Slipping of the clutch may result from either of two common causes. The first is insufficient spring tension, and the second greasy surfaces. The remedy for the first is obvious. The second is only possible with leather clutches, and the remedy lies in getting rid of the superfluous oil. To do this it is best to use Fuller's earth, French chalk, or talc. It can be blown into the space between the two clutch members by means of a glass tube, and will absorb the oil rapidly. Petrol or resin should never be used, as the former dries up the leather, and the latter imbeds itself into the surface and may ruin it. Before concluding that a clutch spring needs tightening or that some of the oil should be removed from the leather, it is well to ascertain whether the slipping is not due to the fact that some part of the transmission is binding, as this might be the real cause of the trouble and the slipping of the clutch merely one of the results.

## MOTOR-CAR MISHAPS.

A BATCH of five London motor-cyclists came to grief on the Oxford Road, near Uxbridge, at midnight the other evening whilst on a return journey to town. Three of the men sustained such terrible injuries that they were detained at the Uxbridge Cottage Hospital, where they are under treatment.

THE tyre of a car used for the distribution of newspapers in the western districts of Norfolk came off while the vehicle was proceeding and became entangled in the steering gear with disastrous results. The car was completely turned and wrecked, while two of the three occupants were seriously injured.

In turning out of Milsom Street, Bath, the other day two motor-cars collided, fortunately without hurt to the occupants. One of the vehicles, however, was considerably damaged. The owners of the cars were Mr. J. J. Hibbert, Frome Street, Trowbridge, and Mr. W. Walker, 26, Pembroke Gardens, London.

WHEN Mr. Wigan was motoring with his son near the esplanade at Portlucaw, on Sunday, the steering gear of the car caused trouble, and the vehicle dashed over the sea wall at a point where it is twenty feet high. Mr. Wigan's son was thrown out, but escaped uninjured.

A LARGE motor-car, while running through Clifton, near Manchester, caught fire and was quickly enveloped in smoke. The three passengers, including Mr. Chadwick, of Bolton, were injured in jumping from the car. With the assistance of villagers the flames were extinguished.

AN inquest was held at Walton-on-Thames on the body of Mrs. Eliza Trimby, aged 60, of Walton, who lost her life through being thrown from a trailer attached to a bicycle at Cobham on Good Friday. The evidence showed that at a cross-roads, the rider of the bicycle turned sharply to avoid a motor-car approaching at right angles, and the trailer capsized. Mrs. Trimby was thrown out right in front of the car, the hind wheel of which passed over her head, killing her instantly. Lord Westbury, the owner and driver of the car, said there would have been no accident if the trailer had not overturned. His car was four or five yards from it, and was not going more than eight miles an hour. Lord Westbury added that in his opinion trailers were the most dangerous things on the roads. A verdict of "Accidental death" was returned, the jury expressing the opinion that the accident could not have been avoided.

A FARMER named Rayner was driving out of North Walsham on Tuesday afternoon, when a motor-car approaching from Sheringham dashed into him. Rayner was thrown out and was caught in the motor and seriously injured. His horse had to be shot.

ERNEST Cotterill, of the Mount Stanhill, near Reigate, head game-keeper to Mr. Langford, was knocked down and run over by a motor-car while proceeding on his round at Norwood Hill on Monday night, and his left leg broken in two places just above the ankle. Cotterill crawled into a ditch, where he remained some time in the hope of receiving help. It is reported that the motorists proceeded on their way without rendering assistance—a point upon which inquiry should be made.

## POLICE TRAPS.

REIGATE.—In the neighbourhood of Reigate traps have been and are being laid. Motorists approaching within reach of the town are advised to exercise caution.

DURING the holidays the police were watching motorists at several points on the Brighton road, notably between Kingswood and Banstead. THERE is a measured furlong at Mickleham (Surrey).

A POLICE trap is in operation a mile east of Haddington (N.B.) to the town.

A POLICE trap is in active operation between Sawbridgeworth and Bishops Stortford, on the main London-Cambridge road.

## CLUBS AND ASSOCIATIONS.

### MANCHESTER.

SUNSHINE and spring air favoured the Manchester Automobile Club on their second run of the season to Dovedale. The coffee-room of the Izaak Walton Hotel was filled when afternoon tea was partaken of by the crowd of visitors who had taken advantage of the beautiful day to join the gathering, and the yard of the inn presented a very animated appearance with the twenty-seven fine cars that were stored there, each of which had made the run of forty-five to fifty-five miles from Manchester and neighbourhood without a hitch. The visitors when the cars left had an interesting spectacle in watching each departing car wind its way up the very steep hilly road which leads from the hotel to Thorpe Cloud station, a long stretch of which is clearly visible from the front of the hotel.

### SOCIETY OF AUTOMOBILE MECHANIC-DRIVERS.

A WELL-ATTENDED general meeting of this society was held on April 4th at their headquarters, 51, Brick Street, Piccadilly, W. The chair was taken by Mr. Groves, the treasurer. The first portion of the evening's business was opened by Mr. Clarke, auditor, who supplied the members with a satisfactory account of the financial status of the society.

The matter of the certificates issued by the Automobile Club of Great Britain and Ireland was brought forward and commented upon by several members present, all of whom were unanimous in the view that the charges were exorbitant, that the examinations were not a proper test of a mechanic driver's capabilities, and, if there were to be examinations, they ought to be under Government control or County Councils, who ought to examine somewhat on the lines of Scotland Yard in issuing their Metropolitan carriage licences.

It was decided that the Benefit Fund be considered at the next committee meeting.

A proposition was then put to the meeting and carried unanimously that a monthly subscription of 2s. be levied, and to commence from the first Monday in May, also that all existing members should notify the secretary of their whereabouts by post immediately on seeing this report.

The elections of officers and committee for the ensuing year then took place, and are as follows:—President, Mr. Arthur Wood; vice-president, Mr. R. Budd; hon. treasurer, Mr. H. Groves; hon. secretary, Mr. A. Ivens; committee, Messrs. J. Walters, H. Walters, Hall, Randall, Millwood, Nicholls, Kirkwood, Taylor, J. Burgess, W. Burgess, Johnson, F. Randall, Lamb and Freeman.

### WOLVERHAMPTON.

THE opening run of the season of the Wolverhampton Automobile Club took place on Saturday week. A very large attendance assembled on the Dunstall Park Racecourse, and afterwards proceeded to Newport, where tea was provided. Among the cars present were those of Messrs. Charles Elwell, H. Bayliss, F. Bishop, F. Bayliss, Woodruff, F. Corker, J. Dyke, Angus Shaw, T. T. Mills, Deanesly, T. Cureton (President), E. Genna, F. Eastmead, T. Gatis, J. W. Stirk, F. W. H. Trusselle, C. H. Shacklock, J. O. Evans, Edwin Bayliss, Scott, Spackman, W. A. Rochelle, and Pratt. Of the cars present twelve were Sunbeams, while the Star, Wolseley, Enfield, Clement, Rex, Panhard, Regal, Talbot and Alldays were also represented.

### NORTH-EASTERN AUTOMOBILE ASSOCIATION.

THE North-Eastern Automobile Association has arranged for a hill-climbing competition, which will be held under the closed competition rules of the A.C.G.B.I., and is to take place on June 16th. The hill selected is known as Ragpath Side, about 2½ miles from Lancaster, to the west of Durham. The steepest portion of the gradient consists of a length of 60 yards of 1 in 4½, and as the total length of the hill is half a mile, it is expected that some interesting results will be obtained. A special feature of the hill is the separate return route for cars that have ascended the hill, which will greatly facilitate the safe control of the competition. The whole of the hill is visible from start to finish, and as there is very little traffic on the road, it is exceptionally suitable for the purpose of the competition. Under the above mentioned rules, the competition will be open to cars either driven or owned by members of the Association.

### YORKSHIRE.

UNDETERRED by the partial failure of their speed trials on the sands at Filey last year, the Yorkshire Automobile Club has tentatively resolved to adopt a sand track again for a series of speed trials—not at Whitsuntide, as last year, when the holiday crowd spoiled the course, but during the second week in July. A committee of inspection, including the vice-president, Mr. Penrose Green, the chairman, Mr. Hepper, and the secretary, Mr. C. P. Wilson, are to examine the sands between

Redcar and Saltburn shortly, with a view to selecting a suitable mile and a half track. The stretch of sands between these two North Yorkshire resorts is superb for fully five miles, firm, even and broad, and it will not be difficult to select a capital course. So excellent is the stretch under consideration that a local firm has attempted to get permission to run a motor-car service between Redcar and Saltburn along the sands during the summer months. It is intended to make this year's speed trials specially noteworthy, and the arrangements will be on a much larger scale than last year and entirely controlled from head-quarters. The Yorkshire Club also hopes to arrange a hill-climbing competition on a private road during the summer.

A lecture was given at the club's headquarters, the Great Northern, Leeds, on Wednesday of last week, by Mr. Claude Johnson, on "Incidents, amusing and serious, in connection with the earlier days of motorism." At the conclusion Mr. Johnson was made an hon. member of the club.

On the 28th inst. the first club run of the season will take place to Harrogate. Members will meet at the Hotel Majestic at 4 o'clock, where they will be entertained to afternoon tea by the chairman of the club (Mr. E. H. Hepper) and Mrs. Hepper. For May 12th a run is arranged to meet the Cleveland branch at Boroughbridge.

The speed trials for this year will not be held on June 30th, as previously announced, on account of the date clashing with other important fixtures. A meeting has been called for Wednesday next, when the club and its branches will confer as to a suitable date and place.

### SOUTH HERTS.

THE opening meet of the South Herts Automobile Club was held on the 7th inst., at headquarters, the Falcon Hotel, Waltham Cross. The weather was delightful, and thirty-one members attended the meet, others joining in the run to Stevenage, where tea was partaken of at the White Lion. The return journey was started about six o'clock. Among

The Opening Meet of the South Herts Automobile Club.

those present were Messrs. S. R. Noble, W. G. Birt, H. E. Honnor, W. Gilbert, W. J. Dawbarn, J. D. Wheldon, W. L. Gray, W. Feare, F. Sykes, S. Jehan, P. Warren, G. H. Fell, W. G. Haward, T. P. Trounce, H. C. Walsh, C. Fell, F. W. Foott, R. Rochford, C. Helstrom, A. McFarlane, C. Trotter, W. E. Hamilton, W. R. Clarke, Strauss, and H. W. Spaight (hon. sec.).

### BRITISH MOTOR-BOAT.

THE opening meeting, at Kingston-on-Thames, on the 5th prox., shows signs of being even a greater success than the one held last year. This meeting will be the official opening of a club station at Kingston, where members will find a club room on the river front at Nuthalls.

FIFTEEN new members have been enrolled in the North East Lancashire Automobile Club, and representatives from Burnley, Barrowford and Colne have been co-opted on the committee.

THE opening meet of the Hertfordshire County Automobile Club took place at Hatfield, members having tea at the Red Lion.

THERE are now over 500 members of the Automobile Association.

THE Kent A.C. is meeting to-day (Saturday) at the Sir Jeffrey Amhurst Hotel, Ightham.

### MOTOR-CYCLE RECORD.

ON Easter Monday, C. R. Collier and G. A. Barnes had a one hour motor-cycle match at Canning Town. The former beat all English records from one to twenty-seven miles when his belt snapped. Other mishaps ensued, but, with the help of a second machine, he rode 50½ miles in the hour. His first 20 miles occupied 21 min 23 1-5 sec., thus beating the old record by 46 3-5 sec.

## SCOTTISH RELIABILITY TRIAL.

SUPPLEMENTING the list of entries in the Scottish Reliability Trial published on page 135 of our issue of the 7th inst., the following additional entries have since been received :—

Name.	Car.
T. Masui, London ...	14-22-h.p. Germain.
Buchanan Shiell, Perth ...	20-30-h.p. Maudslay.
R. L. Jefferson, Coventry ...	8-h.p. Rover.
J. K. Starley, Coventry ...	6-h.p. Rover.
C. S. Rolls and Co. ...	20-h.p. Rolls Royce.
C. S. Rolls and Co. ...	30-h.p. Rolls Royce.
The Swift Motor Company, Ltd., Coventry ...	9-10-h.p. Swift.
F. Vernon Wentworth, Saxmundham ...	30-h.p. Coventry Daimler.
The Kennedy Motor Company, Ltd., Glasgow ...	20-32-h.p. Darracq Phaeton.
The Kennedy Motor Company, Ltd., Glasgow ...	10-h.p. Darracq Phaeton.
The Caledonian Motor Car and Cycle Company, Ltd., Aberdeen ...	18-24-h.p. Peugeot Phaeton.
Minerva Motors, Ltd., London ...	32-h.p. Minerva.
Friswell, Ltd., London ...	30-40-h.p. Peugeot.
T. C. Pullinger, Beeston, Notts.	30-40-h.p. six-cylinder Beeston Humber.
Legros and Knowles, Ltd., London	25-30-h.p. Iris.

## EXAMINATION QUESTIONS.

BELOW we give the questions which were set at the recent examination in New York to select motor-drivers for certain municipal departments where motor-vehicles have been introduced :—

1. What is the difference in construction between the air-cooled and the water-cooled motor, and what attachments or extra parts are necessary for the operation of either type?

2. Describe as clearly as possible exactly what takes place in the cylinder of a four-cycle motor, during one complete cycle, including the necessary operations of valves, ignition on the car and use of (a) sparking plug, etc.

3. Describe the construction, location and use of (a) coil, (b) commutator, (c) sparking plug.

4. Describe in the same way the construction, location and use of (a) circulating pump, (b) radiator, (c) silencer, (d) what effect does cutting out the silencer have on the engine?

5. What are the most important parts of the engine to be lubricated? State fully what points are to be looked to in regard to kind and amount of oil used and care of lubricating devices.

6. State all points to be looked to in taking supply of petrol; (b) what special care is necessary with the water-circulating system in cold weather.

7. (a) What care should be taken in changing gears, starting and reversing; (b) how is the speed of engine regulated while running, and why does this regulation cause a change of speed?

8. What brakes are there on an automobile? Describe how each one acts, and what is its special use.

9. State in detail everything you would do or see to in preparing an automobile in your care to take out on the road and in getting under way.

10 and 11. Write a short account in the form of a report to the owner describing some accident to the engine or machinery of the car in your charge, and how you repaired the same.

12. What are the city regulations in regard to speed and lamps, covering automobiles?

13. Draw rough sketches showing the proper course of a vehicle in turning from one street into another, (a) to the right, (b) to the left; also what other general rules should be observed by the driver of a vehicle.

## PUBLIC MOTOR SERVICES.

A MOTOR-BUS service has been commenced between Chagford and Moretonhampstead.

HERNE Bay and Canterbury railway station are now connected by a motor-bus service.

MOTOR char-a-bancs are being introduced at Scarborough by the North-Eastern Railway Company, and will carry visitors to Forge Valley and other beautiful drives for which Scarborough is famous.

A MOTOR-BUS has lately been journeying in Carmarthenshire, Pembrokehire and Cardiganshire, with a view to the institution of a public service in West Wales.

THE authorities in many places are watching the condition of certain streets used by motor-omnibus companies as lay-byes. At Putney the nuisance has become so marked as to be the subject of discussion at the meeting of the Wandsworth Borough Council, which has resolved to bring the matter before the Commissioner of Police.

A SERVICE of motor-buses is now being advocated between Edmonton and the City.

THE Provincial Motor Bus and Traction Company are entering into an agreement with the London and District Motor Bus Company for the

purpose of running motor-buses in London, and have arranged with Messrs. Armstrong, Whitworth and Co. to take the whole of their output of chassis for some time to come.

DURING the holidays the fares of the motor-buses running between Bristol and Clifton were doubled, with the result that those returning to the city from the Suspension Bridge were generally empty, while the trams which ran at ordinary rates from the other end of the Downs were crowded. Both trams and motor-buses belong to the same proprietary.

At a meeting representative of the traders and public bodies of Gloucester, it has been decided to establish a motor-bus service between that city and Malvern. The two railway companies running into Gloucester are said to have expressed themselves in sympathy with the scheme.

## ROAD REPORTS.

DERBYSHIRE.—Complaints have been received respecting the bad state of some of the Derbyshire roads, and several influential members of the Sheffield Automobile Club have taken the matter in hand and are bringing it before the proper authority.

CLEVEDON.—This rising resort of Somersetshire has been much frequented of late by motorists from the neighbouring counties, and those going from Bristol via Long Ashton, Wroxall and Tickenham have had to proceed cautiously owing to the long tracks of unrolled stone that have lain about. The route via Portishead, Weston-in-Gordano and Clapton has also been popular, but the roads are narrow as well as picturesque, and the way is not wholly comfortable.

DUNSTABLE.—Motorists touring through this district at Easter found the road surface in splendid condition.

PERTHSHIRE.—At the last meeting of the Perth District Committee of the County Council, the road surveyor reported that he was endeavouring to do rolling in with the least quantity of binding possible, but that the damage by motor-cars had been very pronounced on the glen roads.

BAGSHOT.—On the petition of the inhabitants of Bagshot, the Chertsey Rural District Council is appealing to the Surrey County Council for assistance against the rising dust. The road surveyor has been directed to make a special report on the subject.

## CASE DISMISSED.

MR. HALL WATT, who is a Justice of the Peace for the North Riding of Yorkshire, was summoned by the Grantham police for driving through Grantham in a manner which was dangerous to the public. The police had timed him by telephoning between Grantham and Stanford, although he was summoned for committing the alleged offence in Grantham. When the police attempted to give evidence of the speed at which he travelled between the two towns, Mr. Huntly Jenkins, instructed by Mr. Staplee Firth, who appeared for the defence, protested against the evidence being brought in as it was irrelevant, and after considerable argument the magistrates upheld his objection. They had not only summoned Mr. Watt but his chauffeur, who was driving in a second car behind him. Both summonses were dismissed.

## CASES AGAINST MOTORISTS.

At the Bow County Court an action was brought by Mrs. Ison against Mr. Michael Moyle, a cycle and motor manufacturer, to recover damages for personal injuries sustained by her on January 1st, 1906. The action was brought to recover the sum of £50, and the plaintiff's case was that between 11 and 11.30 p.m. the defendant's son, Mr. Percy Moyle, was riding a tri-car along East India Dock-road, Poplar, at a speed of twenty miles an hour and within a yard of the kerb on the wrong side of the road, and that as she stepped off the kerb to cross over the road she was knocked down, dragged a considerable distance, and the car ran over her face. According to the evidence of the defendant's witness, the plaintiff was crossing the road, and the motor-car was proceeding at eight or ten miles an hour in the centre of the road, when a cyclist a little distance in front was thrown over by a dog, and this so frightened the plaintiff that she stepped suddenly back and knocked against her companion and fell to the ground, and the car was stopped so suddenly that the tyre burst and fell over on its side three or four yards before it came to the woman. After a long hearing the jury gave a verdict for the defendant, with costs.

Place.	Summoned for	Result.
Beaconsfield ...	Exceeding legal limit	£5, etc.
Epsom ...	Six cases of exceeding legal limit	£3 to £5 each.
Wolverhampton ...	Dangerous speed	£1, etc.
Chertsey ...	Exceeding legal limit	£5, etc.
Edinburgh ...	No rear identification plate illuminated	£1, etc.
Eastbourne ...	Dangerous speed	£5, etc.
Dorking ...	Exceeding legal limit	£5, etc.
Kingston ...	Several cases of exceeding the legal limit	£3, etc.—average fine.
Enfield ...	Exceeding legal limit	20s., etc.

# THE Motor-Car Journal.

VOL. VIII.]

[No. 373.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

**G**IPSY life, with its freedom from the restraint of conventionality and the prying curiosity of neighbours, is regarded by many people as the ideal plan of existence. Men like Mr. H. T. Eve, M.P., and Dr. Gordon Stables look upon the caravan as necessary for the enjoyment of a holiday. Now comes the

suggestion that the motor-bus may be utilised for the purpose of seeking health in the rural districts. The tourists may disport themselves on the main deck during the daytime, descending to the interior of the vehicle by night. For the latter purpose the bus might be fitted up as a bedroom—a work not wholly impossible when we remember Miss Kate Cutler's improvised dressing-room of a few weeks ago. There is no question of the delights of such a means of enjoying a holiday, and doubtless the idea will find practical development ere long.

### Road Improvement.

THE annual report of the Roads Improvement Association will be formally presented to the membership at the annual meeting to be held on Friday, the 27th. It indicates a year of great activity. Jointly with the Automobile Mutual Protection Association, it is now organising experiments with several different kinds of dustless road material in order to test the comparative effectiveness, durability, and cost, and it is prepared to contribute £1,000 towards the cost of these experiments. In the opinion of the Association experiments of this kind should be conducted by the State, which should advise the local authorities from time to time as to the best means of making and repairing their roads. Until the State, however, undertakes this work, the Association, to the best of its ability and the extent of its resources, is acting as the intelligence department in all matters connected with highway administration in this country. Good work has been done in moving the authorities to action in connection with the condition of the roads in the Royal Parks. The Association is of a representative character, and eight bodies with an aggregate membership of 120,000 elect representatives to its council and contribute to its funds.

### Errors of Judgment.

THE dictum of the Recorder of Guildford in allowing an appeal by a motorist against a conviction by the borough justices should be appreciated by all concerned in the administration and the perversion of justice in the southern counties. As reported on another page, the driver of a motor-car, exercising considerable care in travelling along the highway, had the misfortune to cause a Bath chair and its occupant to be overthrown. In fining the chauffeur the magistrates said he had been guilty of an error of judgment in trying to run between other vehicles when there was not sufficient room. And yet he was fined for driving in a manner dangerous to the public—a technical definition that is not always in accord with the alleged

offence. Mr. George Cave, K.C., the learned Recorder, before whom the appeal was heard, rightly said that if a driver exercised all the care he could, and then, as in this particular case, committed an error of judgment, he should not be convicted of driving dangerously unless, of course, specific evidence on that point could be tendered. It was well that the appeal was brought; and the result should be appreciated by the Guildford borough justices.

### Motor-Car Imports and Exports.

THE great vitality of the automobile movement is clearly reflected in the enormous importation of foreign motor-cars into this country at present taking place. Each month this year, so far as it has gone, has shown a great increase over the similar period of 1905, and the March returns now available establish a new record by achieving the largest total so far attained. During the month no less than 600 cars were imported, including many intended for exhibition at the Cordingley Show, their value being given as £230,887. Parts were responsible for a further £184,763, giving a combined total of £415,650, as against £314,554 in March, 1905. For the first quarter of the year the aggregate imports have attained a sum of no less than £1,125,062, an increase of over a quarter of a million sterling. As regards the exportation of British motor-cars and components, a steady upward tendency is noticeable. The shipments last month comprised 89 vehicles, valued at £31,814, to which parts to the extent of £22,940 have to be added. The combined total is thus £54,754, which contrasts with only £39,331 in the preceding month, and £22,611 in March a year ago.

### Motoring in Royal Parks.

ON Tuesday next the new regulation of the Commissioner of Works with regard to the admission of electric carriages into Hyde Park will be applied, and only those that have been licensed and bear badges will be admitted between the hours of four p.m. and seven p.m. The new Order will continue in force till the end of July, and applications for the necessary permissions must be made to H.M. Office of Works, Storey's Gate, Westminster, S.W.

### A Scottish Case.

WE congratulate the Edinburgh motorist against whom allegations were made of exceeding the legal speed limit in Princes Street, Edinburgh, on being able to convince the sheriff as to the inoffensive character of his driving? The evidence called for the defence was of a very conclusive nature, rendered all the more so by the experiments made by Professor Stanfield, who, as will be seen from the report on another page, was called as a witness. In order to test the speed of the car, he had measured out a quarter mile track on one of the suburban roads of Edinburgh, and took the mean of several runs with and against the wind, which was very strong at the time. He was thus able to show that the speed of the car could not be as high as stated by the

police. The police witnesses were not experienced in the use of stop watches, and considered the ascertaining of the speed of a car as a very simple matter—mere child's play—in fact they did not appear to be able to read to fractions of a second. The method adopted by the police was to station a man at each end of the measured length. As the car passed the first man he started his watch, and the second man did the same as the car passed him at the other end. The two men then met, simultaneously stopped their watches, and subtracted times. The times were 3 min. 42 sec. and 3 min. 3 sec. respectively, representing a time of 39 sec. over the measured distance. As can be readily seen, this method requires the most accurate timing and good watches to give reliable results. At the same time there is no doubt that it is a common occurrence for motor-cars to travel Princes Street at too great a speed. This is to be deprecated, as it produces a bad feeling amongst the general public against the motorist, and moreover, is quite unnecessary.

Motoring in Australia—A Wolseley Car on the Road, near Sydney.

#### The Use of the Traders' Mark.

AN interesting point of motor-car law has been heard at the Clerkenwell Police Court, when Mr. W. J. Masser, the well-known proprietor of the Lancaster Motor Garage, was charged by the police (1) that he did unlawfully aid and abet the commission by one Thomas Cherry of a summary offence in unlawfully using a motor-car on a public highway without the said car being registered; (2) being assigned a general identification mark under the provisions of the Motor Car Act, 1903, by the London County Council, did unlawfully fail to keep a record of the name and address of the person driving a motor-car used on a highway. The police stated that the second defendant was driving a motor-car which was towing another car. They maintained that by doing this the car was not being used in accordance with Section 2 Sub-Section 4 Proviso (b) in that the car was not being used after completion on trial, nor was it being used on trial by an intending purchaser. The police further complained that the car which was being towed had affixed to the back of it the general identification mark, which in reality, they alleged, ought to have been affixed only to the car which was being driven. For the defence, Messrs. Kenneth Brown and Co. called evidence to the effect that Mr. King was the person who actually took out the car with the general identification number upon it; that he was testing the

vehicle, which was incomplete, and called at the exhibition then in progress at the Agricultural Hall and suggested towing back a new car, which was then about to be placed upon a trolley, in order to give a test to the chassis he was driving. He then instructed Cherry, the driver, to drive the chassis back which Mr. King had taken out. Under the circumstances, therefore, it was contended by the defence that this was a trial after completion and that the Act of Parliament did not say that no other vehicle could be towed. Further, the defence contended that it was sufficient compliance with the Act of Parliament and the Regulations by the name of Mr. King being entered upon the book on the occasion when the car was taken out, and that there was no rule stating that if the driver changed on the road his name should be entered in the register. Furthermore, that it would be almost an impossibility to do this, especially if the car was being tried by an intending purchaser who commenced driving while the car was on the road. With regard to one of the numbers being placed on the car that was being towed, it was stated that this was exactly what the Regulations required to be done. The magistrate, after hearing the evidence, stated he was prepared to dismiss both summonses.

#### Warning Motorists.

THE Croydon Bench on Wednesday resumed the hearing of the summons against Mr. W. F. Little, of Norbury, Croydon, for obstruction. The circumstances have been already reported in the *M.C.J.* On the 4th, defendant, being aware of motor-car traps in the main road, by holding up his hands and in one case calling out "police trap," warned approaching motorists, who slackened their speed and so rendered inoperative the arrangements of the police to time motorists over measured lengths. The defendant, who said he might have warned twenty motorists, denied having connection with any motorists' association, and stated that he not only acted out of pure good nature, but that he had as much right as anyone else to prevent the law being broken. Mr. Muskett contended that defendant's action amounted to the obstruction of the police while in the execution of their duty. The Bench considered the alleged offence did not come within the Act, and dismissed the case, but, on the application of Mr. Muskett, the police agreed to state a case. This decision, it will be noted, is in accord with the opinion previously expressed in these columns.

#### Caution in the Car.

THE serious accident which has befallen Mr. Howell Idris, M.P., suggests to motorists the necessity of exercising care as to their actions when travelling at a fairly rapid rate of speed. The M.P. was motoring through St. Asaph on his way to Dolgelly. When just outside the city he rose to put on his overcoat, but, unhappily, overbalanced, with the result that he fell from the car and sustained severe injuries to his head. Mr. Idris was conveyed to the infirmary, and although the first grave reports have since been modified, his condition will require rest and quiet for weeks to come. To change garments while in automobiles that are speeding rapidly is certainly a risky proceeding—especially if the passenger stands up in the body of the vehicle; and the moral of this accident should not be lost by other motorists.

#### The London Traffic Committee.

THE Select Committee of the House of Commons on Metropolitan Traffic, presided over by Mr. Henry Norman, is being overwhelmed with evidence, particularly with regard to forms of automobile traffic. As, however, it is desirable that the report shall be produced at the earliest possible moment, the Committee are economising their time, and they have already divided the evidence under the two chief headings of horse-drawn and mechanical traffic. As to the first, the difficulty of identifying ordinary horse-drawn vehicle drivers is

one which has engaged the attention of the Committee; and as regards the second, in which the drivers are already identifiable, the problems arising from the nuisance of smoke, smell, dust and danger to the public are being considered. In view of the importance of the recommendations which the Committee are expected to make as to the conduct of traffic in the metropolis, the report, which may be expected a few weeks after Whitsuntide, will be of considerable interest.

#### At San Francisco.

SAD indeed has been the lot of San Francisco during the last few days, and never were stranger automobile parties than those that in the early morning light sped away—as fast as they could until stopped by the fissures in the streets—to positions of safety. All kinds of vehicles were requisitioned, while motor-cars proved of the greatest value in rescue work. The accompanying illustration of the Golden Gate Park, from a photograph taken under happier conditions than those that have lately prevailed, is of interest, for there a great refuge camp has been established where hundreds of

have taken to motoring, developments may take place in the near future which would have startled the inhabitants of a pre-automobile world.

#### The Automobile Engineers' Institute.

ON Friday last week a special meeting of members of the Automobile and Cycle Engineers' Institute was held at Birmingham, to consider the transference of the headquarters of the Institute from the Midlands to London. The President (Mr. A. E. Tucker) occupied the chair, but the members present were not sufficient to form a quorum. An informal discussion, however, took place. The President, in giving a *résumé* of what had been done, explained that Mr. Douglas Leechman, in October last, suggested that he (Mr. Tucker) should deliver his presidential address in London, but this was impracticable. Mr. Leechman circularised the London members on the advisability of forming a London centre, with the result that three very successful meetings had been held at the United Service Institution, Whitehall. The council were satisfied that the proper *locus* of the Institute was London, and accordingly

A Motor Meet in Golden Gate Park, San Francisco.

homeless people have been sheltered. In the organisation of relief work automobiles played a prominent part, supplementing the railway in taking supplies and rendering valuable assistance in their distribution. Motor-cars were also used to carry the dynamite which was used to blow up the buildings in the path of the fire. Happily the worst is now over, but we would tender our sympathy with our kinsmen across the Atlantic in these days of sadness and loss.

#### The Church Garage.

OUR recent Comment on churches that have been converted into motor garages in this country gives added interest to the announcement from America that a Presbyterian Church in Cincinnati has just erected a motor garage for the use of its members. Here we are familiar with the long lines of cycles outside churches and chapels in country and seaside resorts during the summer months, but no church has yet been bold enough—nor has the necessity arisen—to erect a house wherein those of the congregation who motor to church may house their cars during the service. Now that bishops, however,

proposed to transfer the headquarters to the metropolis. Mr. W. Rees Jeffreys had been asked, and had consented, to undertake the duties of secretary. The character of the Institute would be altered so as to include automobile engineers only, and the name would be altered to "The Institution of Automobile Engineers." It was decided to call another meeting, and, in case no quorum was formed then, to delegate the transaction of the business to the council.

#### A Doctor's View.

THE effect of motoring upon the nervous system is touched upon by Dr. Fisher, medical officer of the Garstang (Lancs.) Union, in an interesting report. The medical gentleman remarks that "Driving a motor-car in a rational way, and not in much traffic, will no doubt be a healthy occupation, but I shall not be surprised if time shows that the nervous system will suffer by the excessive and prolonged use of automobiles. Quite apart from the risks of inhaling contaminated dust, the driver must be at attention. His nervous system is on full tension, and this, combined with the rapid motion, is

bound to have a physiological effect in time on the nerve centres." Dr. Fisher also dwells on the evil effect caused by the motor-car on the country side. In dry weather volumes of dust, containing animal excreta, are sent up, doing damage to meadow and pasture land, and permeating roadside dwellings, causing inconvenience and danger to the occupants. Rural authorities should, he says, macadamise and cleanse the roads so as to minimise the evil as much as possible.

#### Sunday Observance.

At the Spring Assembly of the Baptist Union in London this week there has been some stern speaking in Puritanical vein with regard to Sunday observance, and a resolution was adopted deploring the popularity of Sunday motoring. A Brighton minister complained of the number of motor-cars passing through villages and destroying the quietude of the Sabbath. His views found favour with all the delegates, whose interest in motorism was further whetted by the announcement that the Revs. F. B. Meyer and J. H. Shakespeare are about to start on a motor-car tour, preaching about ten times a day in the open air. We are glad that the motor-car found favour thus far.

#### Club Handbooks.

CLUB handbooks, with programmes for the coming season, are coming into our office with a rush. Such publications are welcomed as indicating a healthy activity right through the automobile movement. The way in which many are compiled suggests care, study, and experience in their preparation, the arrangement being well calculated to assist the members in many ways. That of the Southern Motor Club—to name a noteworthy example—is embellished with portraits of officers and views of the club-room in the Bromfelde Road, Clapham. The fixtures are forty in number, between April and October, including speed judging competitions, launch parties, garden fetes, and club outings of a kind which should encourage the social instincts of members. Chapters on emergencies, lists of local repairers, and much other information is contained in a book which should be a pattern to other organisations.

#### Level Crossings.

FORTUNATELY British travellers have little practical knowledge of the kind of level crossing that makes road touring a varied delight in some parts of France. Just now, however, those who motor in the Midlands are able to easily become victims of railway enterprise, the construction of the new railway works between Alcester and Stratford-on-Avon main roads having secured a crop of level crossings on roads that are freely used by motorists. These are so crude as to constitute a real danger to travellers, while the condition of the roads in their vicinity is almost as bad an evil as the lines that intersect the roadway. Of course it will be urged, in reply, that the nuisance is only a temporary one; but surely the local authorities should have some right to step in and determine the degree of irritation that may be caused to those who use the roads.

#### Car Bodies.

MOTOR-CARS have moved rapidly from the days when they were associated with a rancorous smell, and were driven to the accompaniment of a grating, grinding sound. They can now be seen in the park rivalling the older horse-drawn vehicle in beauty of design and ease of running. The combination of the coachbuilder with the engineer has effected a decided improvement, and, as one of the leading motor-car agents, whose business is chiefly in Society circles, observes, "it is possible, with the combined skill of the builder of the mechanism and the carriage-body, to make practically any type of carriage capable of travelling any distance, at any speed, to satisfy any requirement." There are some people who can afford the cost of cars for both town and country services, but as automobilism

becomes more general the demand for covered-in broughams with detachable tops is likely to develop. Thus the motorist can have a covered-in vehicle for town or evening service or an open car for touring and country visits.

#### A Reminder.

IN previous years the London County Council has reminded London motor-car agents and dealers when the time has come for the renewal of their traders' identification marks. This year no notification has been given, and many traders have been caught napping. Having regard to all the circumstances of the matter, it would not be a great concession if the Council followed its plan of previous years instead of harassing traders in this unnecessary fashion. It would not cost much to intimate the time of expiring; to omit to do so, and then to issue summonses, almost approaches the vindictive.

#### Accidents in India.

SOMEWHAT of a new principle in legal procedure is about to be introduced into Bombay, where a Government decree recently promulgated directs that reports concerning accidents caused by motor vehicles shall be submitted to the Judicial Department by the Commissioner of Police and by the district magistrates. Apparently they will then be able to instruct the Public Prosecutor whether prosecution is to follow or not. The necessity for this departure from the ordinary procedure is scarcely apparent; but unfortunately some of the natives do not seem to take the care in crossing the streets that is common among Europeans.

MR. F. W. TEBBETT has a motor garage well located on the main road at Newcastle-on-Tyne.

OWING to the increased demand for Gregoire cars, Messrs. Osborn and Lord have removed from The Broadway, Hammer-smith, to new offices and showrooms at 6, Great Marlborough Street, Regent Street, W.

AN inauguration luncheon given by the directors of the Austin Motor Company, Limited, took place on Thursday, at their works at Northfield, Birmingham, and was presided over by Mr. H. Austin. The visitors were afterwards piloted round the works, and the new cars in course of erection were examined.

THE annual general meeting of Messrs. Dennis, Bros., Ltd., took place at the registered offices in Guildford on the 20th inst., when a dividend of 12½ per cent. was paid to the shareholders and the amount of £4,500 placed to reserve. The shareholders complimented the managing directors on the successful year's trading, and especially on the great progress made in commercial and public service vehicles. The new factory at Woodbridge Hill will give the company every prospect of a continuance of prosperity.

WISLEY HUT, Surrey, was, as usual, visited by a large number of motorists on Sunday last, the pleasant little spot having apparently lost none of its popularity. The road between Esher and Cobham is in certain parts somewhat too freely covered with small loose stones, but near the last-named place a good deal of road-tarring work is in hand, with a view of abating the dust. Owing to the wet state of the tram-lines near the waterworks at Surbiton, a Corre car experienced a nasty skid which resulted in a broken road wheel. Fortunately none of the passengers were injured.

MR. ALBERT HOUSE, who has had a long connection with the motor trade, being one of the pioneers of the movement in Yorkshire, has acquired some large premises, covering over half an acre, in Oak Lane, Bradford, until lately used as a tramway shed and stables. He is forming a company to run the same as a depot for the sale of new and second-hand motor-cars and accessories. Part of the building will be converted into a large garage, while plant is to be installed to enable all classes of repairs to be carried out. In addition it is proposed to hold periodical auction sales of motor vehicles. We may add that the Bradford Carriage Company, Ltd., are still carrying on business in part of the premises.

# How to Drive a Spyker Car.

By F. F. WELLINGTON.

**T**O ensure a long life for a motor-car, it is necessary that every attention should be paid to the following instructions, and, to help the users of the Spyker dustless cars, I will commence from the beginning, assuming the car is standing in the garage or stables. First, make sure that the petrol tank is filled, and the radiator is also filled to the top with water. Take off the bonnet, and carefully oil every moving part with a few drops of oil, and fill the lubricators that are placed there for the purpose, also the drip feed lubricator on the dashboard, which should drop, when the engine is running, at the rate of five to seven drops per minute. Be sure the cap for filling this is screwed down tightly for keeping in the pressure, otherwise the apparatus will not work. If at any time the car is over lubricated, it is an easy matter to open the valve on the lubricator to prevent it working, but it should not be left

whereas in pulling up one's face and body leave the object of destruction or damage that might occur.

As to the driving, it is very essential that when drawing the clutch a few seconds should elapse before the speed lever is moved. This will obviate any noise or chipping the face of the speed wheels. On the first opportunity test both brakes. It is very important that when it is necessary to check the speed of the car that the foot brake should not be used on any account. This should always be kept as an emergency brake, and not as a universal brake. The hand brake is the correct brake to use if the throttle does not check the speed of the car sufficiently. Never on any account drive the car and make use of the foot brake, because this would have to check the car through the small bevel pinion, and, therefore, the strain to the latter is great, and cause undue wear and tear and strain, that ought

Mr. F. F. Wellington at the Wheel of a Spyker Car.

open too long. Also make sure that the crank case has sufficient oil to lubricate the bearings. If accumulator ignition, it is necessary also to see that the accumulator is fully charged. A spare one should always be carried and carefully examined. Finally, make sure that all tools belonging to the car, pump, jack, and repair outfit, spare inner tubes (if carried) are not left in the garage, but are taken on the car.

Now as to the starting of the engine: first look to the throttle, and see that this is in the proper position for starting, also that the ignition is retarded (or put back), so that there may be no shock when turning the handle; also examine the gear levers, and see that they are in the proper neutral notch, then just flood the carburettor by touching the needle on the top of the reservoir attached thereto, and put on the switch. Always make sure to "pull up" the starting handle—not "push down." It is very necessary that one should not push it down, because if the starting handle should slip it might cause damage to one's face through coming in contact with the radiator or lamps,

not to take place, besides back lash, and is often the outcome of the pinion riding the key, and causing a great noise and jar. In climbing hills and pulling the gear back, it is imperative that the car should be as near as possible to the speed in which you wish to engage when changing down from top or direct to second speed. Do not do this too quickly, because it will, no doubt, lead to the missing of the gear wheel and pulling right through it. It may also lead you to believe that you have not got the proper teeth in mesh, and cause you to bring the lever further back, and thus lose the way of the car, and have to resort to the low speed. As regards the control of the engine it is very necessary that this should never race, nor should it be allowed to rotate too fast for the work it has to do. When de-clutching it is always an advantage to bring the throttle down; at the same time, do not forget the ignition lever should be brought down also, if advanced. When leaving the car standing it is always advisable to switch off, or turn the key in the switch, and if the throttle is opened a little and the switch is turned

quickly the motor will generally restart again when mounting the driving seat.

Take, now, the cause of road stoppages, it is simply a matter of A B C to discover the reason for this. We will take A. Look first of all to the ignition, see that the accumulators are not run down, or that any wires are loose on the terminals; also trace the wires to the sparking plugs and see that they are securely fixed and that no sparking plugs are broken, or the porcelain damaged. Examine the commutator and see if the earth wire is properly connected. By turning the handle of the engine, and putting the latter on the dead centre, the trembler will vibrate, and this will give an idea whether it is ignition trouble, or not. If A is found to be correct, next look to B, the petrol, and see if the tank is filled. Examine the carburettor and see if petrol flows to the spraying jet. This sometimes is a source of great trouble, because the petrol, as delivered now to the public, is occasionally dirty, and if no filter is used it will in time cause grit to accumulate at the bottom of the needle, or the connection thereto. If this is found to be correct, it is wise to examine the float inside the reservoir chamber of the carburettor. It is not an infrequent thing to find these are punctured and partly filled with petrol. If this is so, and a new float is not carried, it is necessary to puncture this float in a second place and blow all the petrol out of the float and re-solder.

Passing to C, it is sometimes noticed that before the car stops back fires or popping take place in the carburettor. This is a sure indication of either lack of petrol, or water in the latter. It is easy to find this by disconnecting the bottom of the carburettor and allowing a small quantity of petrol to run through. This will disperse the water for the time being if only a small quantity is found. This often occurs when a car has been stopped after a certain period. There is now only one thing, D, that can prevent the engine running, and that is a broken inlet valve or exhaust valve, or, as sometimes happens with a new car, expansion takes place on the valve spindles, which prevents them moving freely, and thus causing them to stick up, or fix themselves in an open position. It is easy to trace this by turning the engine round and making sure the compression of each cylinder is equal and perfect.

At least once a week the back axle should be oiled with grease and thick oil mixed, and the car jacked up, and each wheel twisted round and examined for end play, and lifted up and down, so as to make sure that all ball bearings are taut, and no balls are smashed. Take the lid off the gear-box, see this is filled with grease, examine the reservoirs at the side of the gear-box, in which thin lubricating oil should be poured. This will last over a week if the wicks that feed the bearings are in their place. On some of the cars ball bearings are used in the gear-box. In this case there are no side reservoirs. Also look to the front steering, see that the leathers covering same are filled with grease, also jack up the front of the car, and see that the steering is not stiff; otherwise it must be lubricated and freed.

It is not an infrequent occurrence that the accumulators are charged in different places by electricians who have very little knowledge of the charging of the latter, and they will connect up the wires, as they think, to the positive pole, whereas if they had tested their wires with a pole paper, or with leads, they would find often the poles of the wires are changed, and thus many an accumulator is supposed to be charged, which is really not the case, but the positive is made negative, and the negative positive. It is essential, therefore, that what is known as pole paper should be kept, with a view of making a test of the terminals before connecting up, especially if one charges accumulators in his house. Do not forget to examine all lamps, and see that these are properly trimmed ready for emergencies, in case one is on the road after dark. Do not expose the inner tubes to the weather or oil. This will destroy them. Inner covers should be carefully wrapped in waterproof. On no account neglect to keep the car properly washed and clean. Finally, do not fill your petrol tanks after dark with a light within five feet of the opening.

## WESTERN NOTES.

NOW that the touring season is fully in swing motorists will be filling their note-books with addresses of garages, recommended hotels, and other memoranda likely to be of service. Fortunately, there is little difficulty nowadays in securing supplies of petrol, and all the large towns have their repair agents; but in out-of-the-way places difficulties are sometimes experienced with regard to repairs, and we shall be glad to provide an opportunity for motorists to compare notes through our columns with regard to the establishments that are able to render useful service to those on tour.

IN a western county recently evidence was afforded of the universality of the automobile. Last season the G.W. Railway ran a service of motor-buses from Cheddar Station to the famous cliffs and caves. Those vehicles have now been sent further west, and Messrs. Burnell Brothers should have no opposition to the motor char-a-banc with which they are speeding over the distance. The narrow squat bonnet and the tube ignition reveal the age of the vehicle, but it runs well, and has no difficulty in maintaining a steady fourteen miles an hour on the splendid roads to Wells, Axbridge, and round about.

BRISTOL is becoming a busy motoring centre, and although tourists naturally prefer the breezy Downs of Clifton and Durdham to the lower regions of the ancient city, motorists will probably find their way to Victoria Street when repairs have to be done. There both the Bristol Motor Company, Ltd., and the Bristol Wagon and Carriage Works Company, Ltd., have repair shops, many travellers through the town making use of the latter company's facilities for the recharging of accumulators.

It is noteworthy that both at Bristol and at Bath motor-bus services are being run by the companies owning the tramways, their value as feeders of the latter having been fully established. On the authority of Sir Vincent Caillard, the chairman of the Bath Electric Tramways, Ltd., we are able to say that so satisfactory were the first six motor-buses put into service on outlying routes that a similar number have since been ordered for an extension of the area covered by such vehicles.

MOST delightfully situated on the Somersetshire coast is the little town of Clevedon, where Messrs. Stephens and Sons are running a motor-car service regularly to Portishead and occasionally to Weston-super-Mare. Mr. Stephens is a man of originality, having made the cars in his own workshops, from whence also came the carriage work as well.

THERE will be a chance for motorists who enjoyed the Light Car Trials in Herefordshire to renew acquaintance with the charming district on the 24th prox., when the Herefordshire Club will hold a hill climb on Frome's Hill, that famous elevation where several cars failed. From Mr. Wilfrid Groom, the energetic secretary of the club, we learn that the entries include cars of the following types:—Adams-Hewitt, Ariel, Duryea, Sunbeam, Napier, Rolls-Royce, Daimler, Rover, Iris, Metalurgique, Humber, Vauxhall, and Clement-Talbot, so that an interesting event should result. Further particulars of the climb appeared in our issue of the 7th inst. The city of Hereford is a convenient centre from which to explore the beauties of the Wye Valley. The county itself is full of variety, its hamlets having many quaint timbered houses and picturesque nooks. An interesting guide to the district has just been issued by the City Council.

MESSRS. MANN AND OVERTONS, LTD., have just issued a very complete catalogue of the 1906 Richard-Brasier cars. Not only does it give full particulars of the various models, but the principal details are illustrated by means of clear drawings. Some useful hints regarding the maintenance of the vehicles in good running order are also included in the list.

## CONTINENTAL NOTES.

### The Coppa d'Oro Touring Competition.

Forty-four entries have been received for the Coppa d'Oro, which is to be held by the Automobile Club of Milan from the 15th to the 25th May. Italy will be represented by three Fiats, five Isotta-Fraschinis, five Diatto-Clements, a Bianchi, three Italias, two Florentias, three Zusts, three Marchands, and a S.A.L. For England a Daimler and three Napiers will compete; for Germany, three Benz and a Mercedes; for France, three De Dions, an Aries, a Krieger, a La Buire, and a Peugeot; and for Switzerland, three Martinis. Owing to the absence of entries the voiturette and light car sections have been suppressed, the event being now entirely confined to heavy touring vehicles.

### A French Industrial Vehicle Competition.

In conjunction with the International Exhibition of Textile Industries which is to be held in Tourcoing in June next, the Automobile Club du Nord is organising a six days' reliability

The competing vehicles will be on exhibition at Tourcoing from June 13th to 17th inclusive. Full particulars of the competition can be obtained from the secretary of the Automobile Club du Nord, 4, Rue de la Gare, Roubaix, who will receive entries up to May 15th.

### Hill-climbing at Lyons.

On Sunday last a hill-climbing competition was held on the Les Cheres-Limonest road, near Lyons, over a distance of 3.35 kilometres. Altogether there were forty-three competitors, divided into eleven classes, which included one for racers over 100-h.p. It was in this section, of course, that the best time of the day was made, Colomb, on a Mors, climbing the hill in 2 min. 28.15 sec.; Vitalis, on a Rochet-Schneider, being second in 2 min. 41 sec.

### The Elastic Wheel Competition.

Interest in French motoring circles during the past week has been centred in the "elastic wheel" competition organised

The Elastic Wheel Competition.—Rigolly at the wheel of the 35-h.p. Gobron-Brillie Car shod with Halle Spring Wheels.

rial of industrial motor vehicles. The competitors will be divided into the following classes and sections:—Class 1, public service vehicles; Section 1, cars carrying from twelve to twenty-four persons; Section 2, ditto, over twenty-four passengers; Section 3, road trains; Section 4, double-deck buses seating at least thirty persons. Class 2, motor vehicles for the transport of goods; Section 1, motor-cycles for loads up to 1 cwt.; 2, cars of a capacity of from 200 to 500 kilogs.; 3, ditto, from 500 to 1,000 kilog.; 4, ditto, from 1,000 to 2,000 kilog.; 5, ditto, from 2,000 to 3,500 kilog.; 6, ditto, over 3,500 kilog.; and 7, road trains. The daily runs are as follows:—

Date.	Journey.	Distance Kilo- metres.	Max. time allowed, hours.
June 6 ...	Paris-Versailles-Pontoise ...	49	7
„ 7 ...	Pontoise-Beauvais ...	50	7
„ 8 ...	Beauvais-Amiens ...	60	8
„ 9 ...	Amiens-Arras ...	68	9
„ 10 ...	Arras-Douai-Lille-Tourcoing ...	72	10
„ 11 ...	Tourcoing-Tournai-Roubaix-Tourcoing	68	9
„ 12 ...	Tourcoing-Quesnoy-Lille-Tourcoing ...	65	9

by the "Auto." Of the thirteen entries, ten put in an appearance at the weighing in at Messrs. Darracq's works on the 17th inst. as follows:—

Class.	Name of Device.	Fitted to
Class 1.		
1	Yberty-Merigoux Tyre ...	16-h.p. Decauville.
2	Ducable Tyre ...	14-h.p. De Dion.
3	Le Securitas Tyre... ..	16-20-h.p. Luc Court.
Class 2.		
4	Halle Spring Wheel ...	35-h.p. Gobron.
5	Soleil Spring Hub ...	20-30-h.p. Renault.
6	Cadignan Spring Wheel...	16-h.p. Boyer.
Class 3.		
7	Halle Spring Wheel ...	24-40-h.p. Rapid.
8	Edmond-Levi Wheel ...	24-30 De Dietrich.
9	Garchey Wheel ...	24-h.p. De Dion.
Class 4.		
10	Monnin-Damidot Spring Wheel.	20-h.p. Darracq.

The first part of the trial was a run on the 18th inst. from Paris to Dijon, a distance of just over 200 miles, the start being made in a downpour of rain. By 9 p.m. six of the cars had safely reached Dijon, viz., Nos. 2, 4, 5, 7, 8 and 9. Cars No. 1 (Yberty-Merigoux), No. 6 (Cadignan) and No. 10 (Monnin-

Damidot) had, it was announced, abandoned, and no news was to hand regarding No. 3 (Securitas). The second day's run, on the 19th inst., was from Dijon to Valence, 183 miles. The 35-h.p. Gobron, with Halle spring wheels, driven by Rigolly, was again the first to arrive, he being followed by the 24-h.p. De Dion (Garchey wheels), the 24-30-h.p. De Dietrich (Edmond-Levi wheels), and the 20-30-h.p. Renault (Soleil wheels), four out of the six starters finishing the day's run. The third day's run, on the 20th inst., was from Valence to Marseilles, 137½ miles. Five competitors started and all successfully completed the journey, the first car to reach Marseilles being the 24-h.p. De Dion with Garchey wheels. Saturday morning saw the four remaining cars on their way to Nice, a further 144 miles, the number having been reduced by one, due to Rigolly, who was driving the 35-h.p. Gobron fitted with Halle spring wheels, abandoning. On the run to Marseilles he had experienced various delays owing to ignition troubles and a leaky radiator, and not being able to obtain spare parts

these columns, two Wolseleys, three Daimlers, and two Humber will represent England in this important international event.

#### Miscellaneous Items.

Two Darracq cars have been entered for the Vanderbilt Cup race.—A service of Clement-Bayard motor-buses is about to be started between Compiègne and Pierrefonds.—The Hamburg Automobile Club is organising a reliability trial from Hamburg to Segeburg and back for May 6th.—Four Panhard cars have just been entered for the Circuit des Ardennes.—The Motor Yachting Committee of the A.C.F. is considering a proposal of the French Minister of Marine to organise a competition of marine paraffin motors.—A valveless inner tube for pneumatic tyres which has been introduced by the Gallus Company is at present attracting much attention in French motoring circles.—The Automobile Club of Guipuzcoa has just been formed at San Sebastian, Spain, with Count de Torre-

The Circuit European.—Washing Day in the Town of Lodi, Italy.

in time he decided not to proceed further. The remaining competitors—the 24-h.p. De Dion with Garchey wheels, the 24-30-h.p. De Dietrich (Edmond-Levi wheels), the 20-30-h.p. Renault (Soleil wheels), and the 14-h.p. De Dion (Ducasble tyres), safely reached Nice in the order named. Sunday was spent quietly at Nice, the cars being placed on exhibition and attracting much attention. On Monday a start was made for Marseilles, a distance of 144 miles. The journey was safely accomplished by all the four remaining competitors. The De Dietrich (Edmond-Levi wheels) arrived first, followed by the 20-30-h.p. Renault (Soleil). The 14-h.p. De Dion (Ducasble tyres), and the 24-h.p. De Dion (Garchey wheels) arrived late owing to mechanical troubles.

#### The Circuit European.

The entries for this great touring competition, known as the Circuit European, so far number forty-nine, the latest additions including a Pilain, several De Dions, a Krieger, a Benz, a Metallurgique, a second Wolseley, and a Pierce, the last-named being an American vehicle. As already mentioned in

Muzquiz as first president.—The Sporting Committee of the A.C.F. has forbidden practice on the Sarthe Circuit on racing cars as from the 1st prox., owing to the heavy wear of the roads caused by the cars.

#### Motor-Buses in Algeria.

La Société Urbaine des Trams-Omnibus de Delcourt à St. Eugene is stated to have decided to put twenty 20-seated motor-buses in service at an early date. A company is also reported to be in course of formation to establish a motor-car service between Algiers and Maison-Carrie, a distance of 12-kilometres.

#### The Malglaive Cup.

M. P. de Malglaive has just offered a cup to the Algerian Automobile Club for an annual motor-car race, to take the form of a kilometre handicap open to vehicles of all horse powers. To secure the cup outright the event must be won by the same competitor two years in succession.

## A. Novel Petrol Motor.

A BRIEF reference to the novel motor exhibited by Messrs. A. Lége and Co., and which formed one of the attractions of the recent Show, especially from an engineering point of view, has already been made in the *M.C.J.* We are now able to give sectional and general views of the engine and to supplement the same with a brief description. As will be seen from Figs. 2 and 3, the engine comprises six horizontal cylinders A arranged symmetrically round a circular frame, entirely enclosed by a casing formed in halves, the top portion being readily removed by unscrewing holding-down nuts. The horizontal sectional drawing reproduced in Fig. 3 represents what would be seen were the engine cut cleanly in half, and therefore shows two out of the six pistons and the distribution gear. The flywheel is fixed to the short shaft H outside the casing. Inside the latter the shaft carries a crank offset g, which by a ball and socket connection carries a short shaft D, which, supported by a central ball socket C, terminates in a second crank offset E attached to a continuation shaft extending for the remaining length of and through the engine. The latter acts as a camshaft for actuating the exhaust valves and ignition gear. The shaft D with the triple ball joints already referred to carries a radial frame B having six arms, and the main body of the engine has a revolver-chamber-like portion in which are formed the six cylinders A. The pistons for these cylinders are

"wobbling" movement, which, in turn, compels the two crank offset bearings to revolve, and the "cranking" effect thus produced causes the main shaft H, with its flywheel, to revolve, and power is given out by the engine. To prevent the radial frame B from revolving with the crank offsets, it carries a supplemental arm, which works backwards and forwards—

in unison with the dishing or oscillating movement of the frame—in a slot formed in the main casing of the engine. The explosions take place in alternate cylinders, so that three cylinders act during each revolution of the main shaft. We have already referred to the connection of the main shaft with the cam shaft. It carries a two-to-one reducing gear, also cams which operate rollers, opening the exhaust valves K. The burnt gases escape to the atmosphere by a circular pipe connecting with each valve, arranged on the front end of the engine. The inlet valves J open atmospherically, and the mixture finds its way from the carburettor through a branched circular piping into the inlets. The cooling water for the cylinder jackets and the lubricating oil are circulated by a pump which performs the two

functions. It is driven by a chain from a sprocket on the end of the camshaft. The spindle of its chain-wheel has a skew-gear which turns an eccentric working an oil plunger pump. The chain-wheel spindle also carries a rotary pump. The upper half of the engine carries a box which has fingers dipping into

Fig. 1.—General view of the Lége Six Cylinder Engine with part of casing removed.

Fig. 2.—Cross sectional view of Lége Motor, showing arrangement of cylinders.

attached by arms terminating at both sides in ball ends, which engage with sockets formed on each of the six radial arms and the pistons respectively. When the engine, which is of the four-cycle type, is started by the ordinary handle, the spherical joints by which the radial arms carrying the piston rods are held at all points allow the frame B to take a continuous "dishing" or

Fig. 3.—Sectional elevation of Lége Motor.

the row of oil-feeds which lead to various parts of the engine, beneath. The engine develops between 15 to 18-h.p., the bore and stroke of the cylinders being 70 by 80 mm. Among the advantages claimed for it are absence of vibration (owing to the rotary method of propulsion), smoothness in running, saving in weight and smaller size of engine for a given horse-power.

## SOME CURRENT TOPICS.

### Developments in Petrol Engine Design.

The other day we had the privilege of inspecting the working drawings of a novel design of petrol engine which is being fitted to a new motor-bus chassis at present in course of construction. The principal feature of the motor is that either petrol or paraffin may be used and that no carburettor is employed to furnish the mixture. In some respects the arrangement is somewhat on the lines of that adopted in the Diesel engine. The ordinary four-cycle system is adopted, but on the suction stroke only air is drawn into the cylinders, this being compressed in the usual way. It is not until completion of the compression stroke that the fuel, in a predetermined quantity, is sprayed into the combustion chamber when it is fired by a plug in which a continuous spark is maintained. Another departure in

Maud Manville, Mr. A. Birtwistle (Blackburn), Mr. R. Stotesbury (Bristol), Mr. D. Hughes Morgan (Talgarth, Breconshire), Mr. C. Hardy (Nottingham), and Messrs. F. Rendle, P. Dawson, A. D. Grigg, W. H. Ash (of London), all of whom, we understand, will drive British Daimler cars, Mr. C. Jarrott, who will pilot a Crossley, and Mr. Robertson Grant, of Edinburgh, whose mount will be an Argyll.

### The Odotachymetre Competition.

So far eleven entries, including two from the Cowey Engineering Company, have been received for the "Odotachymetre" or speed-indicator-odometer competition which the Automobile Club de France is organising. The trials will commence in the testing laboratory of the A.C.F. on May 3rd, and during the ensuing week the instruments will be carefully tested by the jury. A 100 kilometre trial on the Montgeron-Ozoir-La Ferriere road will be held on the 9th May, time being allowed to the competitors to fit their apparatus to cars, which must be of not less than 15-h.p. The points to be taken into account by the jury are—(1) The accuracy of indication; (2) the ease of in-

A Party of Chinese Officials visited Paris last week and inspected several Motor-car Factories, including those of the Hotchkiss and Delaunay-Belleville Company. Our Illustration shows the Party arriving by Motor-cars at the Palace of Versailles.

the engine referred to is the provision of two exhaust valves to each cylinder in place of the usual single valve. Both are situated in the cylinder heads and operated by the same tappets; they are, however, arranged in such a way that one is opened slightly in advance of the other. There are several other special points in the new bus chassis, notably as regards the change-speed gear and the control, to which we hope to refer more fully in a subsequent issue.

### The Herkomer Touring Trophy Contest.

That the 1906 contest for the Herkomer Touring Trophy will prove a worthy successor to the 1905 event is evident from the fact that so far no less than 146 entries have been received. The majority of the entries emanate from Germany, they numbering 110, and including Prince Henry of Prussia, who is expected to drive his own Benz car in the contest. Austria and Hungary are represented by fifteen competitors, France and Belgium by three each, Italy by two (Lancia and Nazzari, who will drive Fiats), and America by one, a Pierce car. As showing the interest which is being taken in the event in England, it may be mentioned that no less than twelve British competitors have entered. They include Lord Montagu of Beaulieu, Mrs

stallation; (3) the regularity of operation and solidity of construction; and (4) the price and weight of the apparatus.

### An Automobile Congress.

The third annual international automobile Congress is to be held in Milan, from the 24th to the 29th May next, the objects being to review the present position of automobile construction and traffic, and to study the economical and technical problems which surround its further development. The proceedings of the Congress will be divided into three divisions:—(1) Technical details of cars and roads; (2) public service operation and heavy commercial vehicles; and (3) legislative and customs matters. In Class I M. Jeantaud and Signor Turrinelli will report on electrical vehicles, M. Serpollet will deal with steam cars, the Chevalier Giovanni Enrico with petrol engines, Signor Balocco with transmission systems, M. G. Kellner with motor carriage bodies, M. L. Ferrus with spring wheels, and Dr. Pirelli with tyres. In connection with the Congress a number of excursions are being organised, including one to Lakes Maggiore and Como. The Congress is open to all motorists on payment of a subscription of 25 francs, on or before May 15th, to Dr. Gildo Guastalla, 14, Via Monte Napoleone, Milan.

A MOTOR mail service has been instituted by the postal authorities between York and Leeds.

THE Salehurst (Sussex) Parish Council is making a formal complaint to the Local Government Board of the nuisance caused by the clouds of dust raised by motor-cars on public roads.

WE illustrate herewith a neat and ingenious luggage carrier intended to be fitted to the rear part of motor-cars, which is being put on the market by Messrs. Thomas Whittingham and Wilkin, of Long Acre, London, W.C. The arrangement is one which should prove of interest to those motorists who do much

Fig. 1.

Fig. 2.

touring on their cars, as when not in use it folds up entirely out of sight. Referring to the plan views above, Fig. 1 shows the carrier fully extended for use, and in Fig. 2 it is seen in a half-closed position. It comprises two cross pieces, connected together by two rods hinged at the centre. The hinged rod on one side is provided, at right angles, with two hollow stays, into which telescope corresponding stays fixed to the opposite rod. The whole carrier is supported by two channel iron members, one at each side, parallel with the frame of the car and sliding in guides fixed to the latter. When opened out, by simply pulling the rear crosspiece, the device forms a table on which trunks and other luggage can be strapped, and when closed it occupies only a very small space and is practically unnoticeable; it can be readily fitted to all cars having side-entrance bodies.

IN giving evidence in a case against a motorist at Shoreham, a policeman has stated that during two hours he was timing cars on a recent day he had to stop only two out of twenty-two drivers.

AMONG the owners of cars who have recently qualified for the A.C.G.B.I. driving certificates are the Earl of Norbury, Sir Horace Plunkett, Sir Bache Cunard, Major C. H. Wellesley, and Capt. A. W. Tufnell.

THE Benz cars are rapidly becoming popular among German Royalty. Prince Maximilian of Baden has just ordered a 40-h.p. vehicle, while Prince Henry of Prussia, who has had a Benz car for some years, has now ordered a 50-h.p. coupé from the makers.

As an instance of what can be done with an up-to-date car, a drive which was accomplished the other day by Mr. Kennedy, of Clement-Talbot, Ltd., on a 20-h.p. Talbot is worth noting, the vehicle being driven from London to Manchester in 5½ hours.

A MOTOR-OMNIBUS belonging to the London Motor Omnibus Company, which was proceeding along Albert Road, Regent's Park, burst into flames on Sunday afternoon as the result of the overflow of petrol. The passengers hastily alighted, and the firemen overcame the outbreak.

AT Green Street Green, a little village between Farnborough and Sevenoaks, Mr. T. Butler, of the Raven Cycle and Motor Works, is catering for the wants of motorists passing that way. He has an inspection pit, and has lately put in a vulcaniser, so that he can quickly carry through any tyre repairs that may be required.

## HERE AND THERE.

LORD KIMBERLEY has just ordered a 25-36-h.p. Richard-Brasier landaulet from Messrs. Mann and Overtons, Ltd.

THE superintendent of the Carmarthenshire Constabulary was probably the first police officer to become a motorist, having acquired a motor-car five years ago.

MESSRS. WARWICK WRIGHT AND HUNTLEY WALKER, LTD., have a stock of 1906 Darracs and Minervas at 483, Oxford Street, W.

IN refutation of the statement so frequently heard that manufacturing and commercial enterprise are declining in this country, it is pleasing to relate that the Portuguese Government, requiring steam motor-wagons and ambulances, placed the order in England, although it was competed for by many Continental firms. The remarkable celerity with which the work was carried out (thirty-nine days) reflects much credit on the contractors, the vehicles in question being originally intended for use in a punitive expedition organised by the Portuguese for their possessions in West Africa. The mechanical transport equipment supplied by Messrs. J. I. Thornycroft and Co., Ltd., consisted of four 5-ton steam wagons with eight 3-ton trailers, and a 30-cwt. steam van specially fitted up for the use of staff officers. The 5-ton wagons have lorry platform bodies, and are of the well-known Thornycroft Colonial type, with vertical central-fired water-tube boilers adapted to burn wood, if desired, and 45-h.p. compound engine. The wagons are of specially strong construction to enable them to be used satisfactorily in rough country, and the transmission gear is all enclosed. Two of the wagons have interchangeable ambulance bodies. The latter can carry twelve men, there being eight stretcher beds in each ambulance. The special light steam van shown in the accompanying illustration is comfortably fitted up for use by

day or night. The wheels are shod with solid rubber tyres, and the wagon is capable of a speed of about fifteen miles an hour on the level. The boiler is of the Thornycroft vertical water-cooled type and the engine is a compound, developing about 25-h.p. The transmission is by Renold chain to a differential on the back axle. All the wagons have satisfactorily passed very severe tests in Lisbon, and are giving the Portuguese authorities great satisfaction.

MESSRS. GOULD BROS. have enlarged their garage in Southernhay, Exeter.

MESSRS. TREVOR AND SONS, of Eastbourne, will shortly add a London depot to their business activities.

MESSRS. ANDERSON, GRANT AND CO., St. Vincent Street, Glasgow, have been appointed district agents for the Cadillac cars by the Anglo-American Motor-Car Co.

THE Imperial Tyre and Rubber Company, Limited, have produced a new pattern of their non-skidding tyres, formed by effective arrow-headed pattern corrugations in the rubber. They can either supply these fitted complete to new tyres of their own make, or can fit them to customers' own tyres at a price only slightly above the ordinary re-treading price. They are doing steadily increasing business in new tyres, which are manufactured entirely at their Clerkenwell Works, and which have already had the test of two seasons' running. The Imperial Company are quoting special prices to motorists who wish to give these covers a trial, as well as guaranteeing satisfaction.

advantages of six-cylinder cars in general and of the Standard 24-30-h.p. and 50-h.p. models in particular. A full description of these vehicles is given, together with illustrations, while some instructive diagrams of the torque of two, three, four and six cylinder motors are included. The catalogue is well worth the perusal of those motorists interested in the multiple-cylinder engine movement.

MESSRS. W. A. RYAN AND CO., LTD., of New Zealand, inform us that their new motor-boat "Togo," fitted with an Ailsa Craig 24-h.p. motor, has won the Auckland Anniversary Regatta.

THE "Ideal" cooling fan exhibited at the recent Cordingley Show by Mr. G. Aldington is to be fitted to the motor sledge which M. Hervieu will use in his expedition to the Polar regions.

To enable users of Clincher motor tyres to obtain replacements without delay, agents have been appointed throughout the kingdom, and the North British Rubber Company has issued a Vade Mecum containing a map showing the towns where such depots have been established, and giving some useful routes.

FROM the Clement-Bayard Company, of Levallois-Perret, France, we have received a copy of the Manual of Clement-Bayard cars they have just issued. The book extends to 144 pages and is remarkably complete, the full descriptions of the various models being supplemented by illustrations of all the principal parts of the vehicles.

THE Austin Motor Company, of Northfield, near Birmingham, has opened a special repair department under the superintendence of Mr. A. J. W. Millership. A capital booklet dealing with the system of checking repairs in vogue has been prepared for local circulation, which should do much to extend the business of the concern in that direction.

A NEW tyre, in which a series of short canvas rubber tubes are bolted under a rim, is being brought out by Mr. O. Cook, of Greenwich, who believes he has secured an invention which will ensure resiliency while avoiding the troubles frequently associated with pneumatics. This new tyre is fitted on an ordinary rim, and will doubtless attract much attention from its novel appearance.

MR. J. C. BURTON has opened premises in Granby Place, Leicester, for the repair of motor tyres.

THE Sirdar Rubber Company, Ltd., have received a large order for motor-bus tyres from Belgium.

MR. T. WILLIAMSON is doing a large amount of motor repair work in the town of Dundalk, Ireland.

REGISTERED without articles of association, the capital of the National Automobile Society has been declared as £1,000.

THE Liverpool Corporation have ordered, through the Sefton Motor Garage, Liverpool, a 7-h.p. Star car for use by the engineers' department.

THE revenue of the city of Manchester has been augmented by £1,700 received from motorists for the registration of cars and the licensing of drivers.

ON Wednesday morning two Vanguard motor-buses were proceeding along Tottenham Court Road, London, practically side by side, when one skidded and crashed into the other. Two passengers were removed to the hospital, but their detention was not considered necessary.

AT the meeting of the Aeronautical Society of Great Britain on the 27th inst., at the Society of Arts, John Street, Adelphi, W.C., Captain Scott, R.N., the commander of the recent British Antarctic Expedition, will address the society on the use of the balloon in the expedition.

THE Acme Rubber and Tyre Company have opened a new motor tyre repair works at 343, St. Vincent Street, Glasgow, which is splendidly equipped for the prompt and efficient building up of old tyres. The company's facilities are not only up-to-date and extensive, but they have already achieved distinction in this class of work. A notable feature of the business is a guarantee of the work they do, and an assurance of its expeditious return to the owner, no matter the distance from Glasgow. The company is introducing a case-hardened light steel-studded tread of undoubted merit, and will be pleased to advise motorists on tyre matters generally.

THE sale of second-hand motor-cars at a place like the Motor House, in Euston Road, London, at the present time has just a touch of pathos in its way. Cars that have made names and the performances of which have been blazoned through the Press are sold almost in obscurity. Thus the other day we saw a Mors brougham which had been the property of the Maharaja of Cooch Behar, with silver fittings, silver-plated radiator and the usual magnificence attendant on an Eastern potentate. In another corner was Mr. W. S. Gilbert's 16-24-h.p. Napier, and yet again one of Capt. Bewicke's De Dietrichs and a rare old veteran in the shape of a 70-h.p. Panhard racer converted into a touring car and owned by the Duke of Manchester.

THE Ara process is finding much favour in the repair of motor tyres, although only recently introduced by the Ara

Material Patents and Manufacturing Corporation. The method followed is that of cutting rubber into small pieces and placing them into a plunger press, as shown in the accompanying sketch. After being dipped into a fluid called Araline, these pieces of rubber are forced out on the place to be repaired. The specimens which

have been submitted fully bear out the Ara claim to accomplish moulded and "vulcanised throughout" repairs of an absolute and permanent character. The time taken is five minutes for an ordinary piece of work, and the neat little "Ara vulcanising installation" can be used by any amateur.

## CHARGING ACCUMULATORS.

IN our Correspondence columns this week "Anxious" raises a query with regard to the charging of ignition accumulators from an electric light storage battery. As the question is one of general interest, we have prepared the accompanying diagram to show the necessary connections. Small accumulators can be charged from electric light storage batteries at any time, whether the engine is running or not, provided that the large accumulators are charged, and not completely run down, which is seldom the case. In all large sets of accumulators of this kind there are three or four cells at the end of the line, which are called the spare cells, and it is best to charge from these, as they have the least work to do. To charge a 4-volt accumulator we require 5 volts, and as we cannot get exactly this amount from any set of accumulators, we must have either 4 or 6 volts, from the fact that each cell gives 2 volts. It is, therefore, necessary to connect up to three cells and use a small resistance wire to cut down the extra volt which is not required, otherwise we would get too much current. In connecting up a wire it must be connected from the positive terminal of the 4-volt accumulator to the positive terminal usually marked red, which will be at one end of the set, and the negative terminal joined to the negative of the large cells, after inserting the resistance. As the large cells are connected together, care should be taken not to confuse the actual positive or negative lugs of the same, as a red and black lug is connected in each case, except at the ends of the set. If the last lug at the end of the set, where the spare cells are, should happen to be the negative pole of the battery, the negative of the 4-volt accumulator should be connected to this end, and the positive to the positive lug at the end of the third cell.

A suitable arrangement for charging in this way can be fitted up as follows:—On a base board fit four terminals, with a small ammeter between two of them and a resistance between the others. Join the 4-volt accumulator to the two marked positive and negative, and wires from the three cells of the large accumulators to the others, as in the accompanying diagram, and note the current passing through the ammeter. The amount of resistance necessary to pass the current for charging can be tried at first, and then permanently fixed on the base

board. This method of charging accumulators costs practically nothing, and is very reliable and steady. If the engine is running when charging, the circuit may require more resistance, as the voltage of the three large cells will be higher; to allow for this a variable resistance with a small switch may be utilised. The apparatus can be made for about twenty shillings by any good electrician, or at less cost if made up roughly.

THE H. F. vulcanising appliances have been adopted by the Post Office in connection with their motor vehicle department.

## A NEW COMBINED WORM AND BALL DRIVE.

WE illustrate herewith a new silent ball-worm drive for motor-cars which has been devised by Mr. A. T. Collier, of St. Albans, and of which a model is at present on view at the depot of Messrs. H. and W. Greer, Clerkenwell Road, London, E.C. As will be seen, the usual worm wheel is replaced by a disc, in the outer edge of which steel balls are inserted. The

worm is cut on a concave solid piece which encircles about one-fifth of the wheel it drives. The thread is equally spaced about this concave surface, and not about the axis of the worm, the design causing three balls to mesh simultaneously and divide the driving strain between them. Exactly half the ball fits in a cup in the wheel, and the other half in the worm thread. The balls are held by a cage, which forms part of the standard, to prevent them falling out until the worm takes care of them. Owing to the large lubricating surface in the cup, compared to the contact lines between the balls and the worm, the balls turn in the cups and roll along the worm thread. The result is a rolling action, which reduces the friction on the wearing part of the worm. Owing to three large balls meshing simultaneously, a much smaller and lighter gear than now used in fixed teeth gears will, it is claimed, transmit the same horse-power. The gear is cheap to make, the worm being cut by a simple automatic revolving turret, and the cups by a half round cutter. As illustrating the small amount of friction developed by the gear, we may mention that the model can be driven backwards, i.e., the wheel will drive the worm although the thread is only 8 degrees out of the perpendicular to the axis. The dimensions of the parts in the model are: balls,  $\frac{3}{4}$  in. diameter; worm, 3 in. long on its axis; wheel,  $5\frac{1}{2}$  in. diameter; number of balls, 17, and ratio 1 to 17.

MESSRS. ROBERT MORTON AND SONS, LTD., of Wishaw, are opening large showrooms and garage at 42-50, Bridge Street, Glasgow.

MESSRS. MOSS AND WOODD have removed their works and offices from Banister Road, Kensal Rise, W., to Oaklands Road, Cricklewood, N.W.

MESSRS. COCKS, LTD., send a catalogue of the automobile accessories, tools and machinery stocked at 20, Holywell Row, Great Eastern Street, E.C., whither they have lately removed from Marylebone. Their operations are comprehensive, from the supply of motors to the repair of goggles.

CLIMAX MOTORS, LTD., have issued a catalogue for the 1906 season, in which illustrations and descriptions of many standardised details of their cars are given under the heading of Climax characteristics. Specifications are also given of the company's 14-h.p., 16-h.p., and 20-h.p. cars, together with plans of the chassis that will prove of general interest.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, W.C.]

### PETROL AND ELECTRICAL MOTOR-BUSES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the particulars of the new electrical motor-'bus in the last issue of the *M.C.J.*, many attempts have been made during the past ten years to produce this form of public vehicle, but without commercial success. Our American friends were among the first to succumb to the fascination of electricity, and the first, therefore, to realise its insufficiency in self-contained power vehicles. As a manufacturer I have quite an open mind on the subject of what is to be the motor-omnibus of the future. That vehicle will be the outcome, not of some sudden marvellous invention, but will be slowly evolved out of

limit of their life. Given a reasonably sensible design, the life of an omnibus depends upon two things; first, the speed at which it is permitted to travel, and secondly, the efficiency of the repairing staff. If high speeds over rough, uneven road surfaces are frequently repeated, the deterioration in the whole vehicle is excessive, and if there is added to this insufficient attention by the repairing staff to the "beginnings" of wear, then the life of vehicles working under these conditions must be short. If, on the other hand, so long as our road and street surfaces are in the imperfect condition usually met with, a reasonable maximum speed, say twelve miles an hour, the present legal limit, is insisted upon and the work of repairs and renewals in the depot is carried out by experienced engineers with as much care as is exercised by the manufacturing staff in the building of new cars in the builders' workshops, the life of a petrol motor-omnibus is good for ten years. As practical evidence of my belief in this figure, my company undertakes, at a reasonable rate per mile, to maintain the Scott-Stirling omnibuses in efficient running condition for ten years. The London Power Omnibus Company, Ltd., for instance, who are using Scott-Stirling vehicles, have a contract with us on those lines, and I believe that their service is being maintained at a lower rate per mile than any other company at the present time working in London. Their total

VIEWS ON THE COURSE ON WHICH THE HERKOMER TOURING TROPHY CONTEST WILL BE HELD.

[Allgemeine Automobil Zeitung, Berlin.]

every-day working experience. People must not be misled by a few enthusiasts into the belief that the electrical 'bus is any more than another experiment a little in advance, probably, of its numerous predecessors, and the public, in putting money into such a business, must be prepared for failure, or at any rate regard the business as entirely speculative at present. Not until the vehicle has been running for twelve months at the least can any opinion be formed as to its suitability for the heavy work of omnibus traffic or can anything be ascertained as to its economy in operation and its life.

In speaking of the life of motor-omnibuses I have been interested to observe the widely differing views of people of more or less experience. A year and a half or two years has been put as the life of a petrol omnibus by those unfriendly to it, while others have put it down at five to seven years. I quite agree that some of the 'buses which have been hurriedly built by inexperienced manufacturers and put upon the streets must have a very short life, but there are others whose designs are the fruits of years of experience in this special department of the motor industry, and built in British workshops, which will outlast even the seven years which has been put down by some as the

running costs, including the entire depot work, renewals and maintenance, does not, I believe, exceed 8½d. per omnibus mile. This is a figure which I do not think the electric omnibus is likely to improve upon, with the serious deterioration in the electric batteries due to road vibration alone.

On the question of noises for which the petrol omnibus is blamed, any excessive noise is entirely due to insufficient attention in the repairing depot, and while the noisiest 'buses on the streets to-day create no greater nuisance in this respect than the average electric tramcars, there is no reason why the petrol motor-omnibus cannot be maintained running with great quietness if the companies concerned will see that proper attention is given to the systematic repair and renewal of their mechanisms.—Yours truly,

JOHN STIRLING.

### MOTOR-CARS AND DUST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—By all means let county councils find out by concerted experiment what are the least dusty roads that can be economically made.

But it would be absurd for the ratepayers generally to be put to an expense of perhaps ten, perhaps fifty or more, millions, for the convenience of the most selfish class of the community, namely, the motorists.

What is needed first is severe punishment, and after the second or third offence without option of a fine, for motorists who raise dust beyond that caused by, say, an ordinary coach and four. Surely the nuisance now created is already an offence, and it is greatly to be hoped that a test case will be taken shortly. Even if it should be held by the High Court not to be punishable, I think it is already an offence to raise dust enough to make it difficult to see the car's number. The whole pleasure of the country is being spoilt by the disgusting selfishness of the motor-cads. It is the duty of anyone professing to be a gentleman so to use the public roads as not to annoy beyond endurance all those who wish to use them or live near them.

Motorists are bound, at any rate morally, to notice whether they are raising dust; and, if they are, to go slower, even if slower than a four-wheeled cab. I trust that the Motor Commission will recommend that all cars be tested for their dust-raising propensities, and those that offend be limited to, say, twelve miles per hour, and carry some distinguishing mark.

But the selfishness of the motorists is not so great as the shortsightedness of their folly. I write as a motorist who wishes to be able to keep the present reasonable liberties, and to be able to enjoy motoring along even a main road. But the motor-cad, by his dust, spoils the pleasure of all other motorists as recklessly as that of mere pedestrians or cyclists. And, seeing that further legislation is inevitable, it is sheer madness for motor-cads to further exasperate public opinion.—Yours truly,

H. R. REYNOLDS.

#### TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It seems only reasonable to expect the chief creators of the dust nuisance to be also its chief removers.

It is quite illogical to legislate in regard to the lesser smoke nuisance and ignore the greater dust nuisance.

Either the roads should be dustless, which is an impossible condition under the existing systems of macadamizing, or the resulting dust should be removed in the dry state. Added water only produces filthy mud, which induces side-slips.

It is obvious that it would be a great advantage to cleanse the roads through some dry process, and in view of the remarkable results attained by the "Vacuum Cleaner," and the currents of air produced by rotating fans, it is conceivable that germ-laden dust could be drawn by suction into a receptacle instead of being scattered in clouds and deposited elsewhere to the danger and inconvenience of the public.

If, in place of useless water-carts, corporations would introduce a dry system for cleansing the streets, a considerable amount of money would be saved annually to the ratepayers, and the collected dust, instead of being treated as a waste product, might be found a valuable fertilizer for heavy soil.

The country roads should be dealt with by the motorists themselves on the same principle. The more rapidly they travelled the greater would be the volume of dust raised, but the more quickly would it be drawn away into the collecting chamber.

The "early worm" motorists would practically clear the roads of dust, to the advantage of those who followed later in the day.—Yours truly,

CECIL CARUS-WILSON.

#### AN OBJECTIONABLE DEVICE.

##### TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Now that the motoring season is once again in full swing, the newspapers are teeming with letters regarding the ever-increasing dust nuisance. That the complaints are not altogether without reason can be proved by a journey on any of the main arteries out of London, and, indeed, on any country road. As an old cyclist, I must say that I feel extremely sorry for the thousands of riders whose pleasures of the road must now be at a low ebb owing to the blinding dust.

There is one point in connection with the trouble, and one which, although I believe it is responsible for a good deal of unnecessary dust-raising, I do not remember having seen mentioned before. I refer to the exhaust cut-outs which are fitted to many powerful cars, and which are largely made use of on open country roads. During the last few weeks several cars have passed me with the cut-out in operation, and the exhaust thus freely emitted disturbs the dust to a surprising and most obnoxious degree.

As silencers have been improved within the last few years so that they act without undue back pressure, and as powerful motors have come into use which possess a very large surplus of power, the advantage which may formerly have existed in the use of the cut-out in relieving the choking action of a badly-designed exhaust-box and adding slightly to the power of the engine has ceased to be of sufficient importance to warrant the use of this highly objectionable and prejudicial expedient. In my opinion no owner of a modern high-powered car such as is now frequently seen on the road has the slightest legitimate excuse for the use of the silencer cut-out, so far as enabling him to gain power is concerned.

Apart from its dust-raising proclivities the exhaust cut-out is a

wanton offence against the public nerves, and its employment should be abolished if not made illegal.—Yours truly,

TWENTY-MILES-A-N-HOUR.

#### MAGNETO IGNITION SYSTEMS.

##### TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a considerable amount of ignorance seems to exist concerning the true reason why some systems give apparently more power than others, I would point out that the real cause lies in the fact that some systems take more power to drive them than others. Now, in order to obtain a higher voltage or pressure we must, of course, cut more lines of force, and to do this we must take more power from the engine. Of course when a charge is fired it makes no difference whatever in the actual horse power which system is used, providing, of course, the spark is of equal intensity, and the driving power the same for each. It is surprising the amount of power that is absorbed by some systems of dynamical ignition. Personally I still believe the battery system to be the most reliable. When a magneto breaks down it is usually hopeless; moreover it is altogether too delicate a piece of machinery to expect the average driver or garage "expert" to understand. I have seen a magneto rendered useless by a heavy tool falling on the magnets, destroying the magnetic field. A short time ago I was greatly amused to see one of these self-styled "experts" actually place a voltmeter—which he had been using on a battery—between the magnets of a magneto at rest. In conclusion, I would advise those of your readers who have magnetos on their cars never to allow an "expert" to meddle with them.—Yours truly,

E. P. PROUD.

The Iden four-cylinder Car belonging to Mrs. James Browne, Teddington. The vehicle was originally a two-seater, the rear seats and side doors having been added by Mr. J. H. Maltby, of Sandgate, Kent.

#### SIX-CYLINDER CARS AND THE PUBLIC.

##### TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter under this heading in the last issue of the *M.C.J.*, if "C. A. R." had ever ridden in a six-cylinder car I think he would admit that an "expert" was scarcely necessary to distinguish it from a four-cylinder. Again, what four-cylinder engine is as flexible as a six? If as "C. A. R." says, "the advantages are not worth the extra two-cylinders," how is it that at the present time there is such an immense demand for six-cylinder cars? Generally speaking, we find that those who are so ready to run down the six-cylinder engine are interested in the sale of some foreign car the makers of which are not yet in a position to put in a six-cylinder engine.—Yours truly,

H. MUNCKTON.

#### ASCERTAINING OWNERSHIP.

##### TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was recently out cycling, when a car collided with my machine, which was badly damaged. In addition, I was badly injured. I have the number of the car and am anxious to communicate with the owner. I should feel much obliged if you could inform me how to set to work to ascertain his name and address.—Your truly,

R. W.

[In their circular of November 20th, 1903, the Local Government Board said "a copy of the entries relating to any specified car is to be supplied to any other person on payment of one shilling, if he show that he has a reasonable cause for requiring a copy of the entries. The Board has limited in this way the right of individuals to obtain information respecting entries in the register, as they consider that while no unnecessary obstacle should be placed in the way of a person who requires

to identify a car for the purpose of taking proceedings, the entries in the register ought not to be made public for the gratification of curiosity or for any other insufficient reason.]

### A TRICK.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I would like to warn members of the motor-car fraternity of an exceedingly clever trick, of which, but for what may be perhaps termed prudent foresight, we were nearly the victims. On Thursday last a well-dressed man of most plausible speech entered our motor depot in Manchester, and pitched this tale:—He was the son of a squire in attendance upon a certain lord, and he, the son, was to meet the father the next day in Birmingham. Unfortunately he was supposed to have a car, but he had sold it, and gambled away the money. Now would we lend him a car for four days for £50. He could not pay anything then, but his father was going to give him some money in Birmingham, and he would then hand the money to our driver. My Manchester depot telephoned me up, and I said "No," unless you can get something out of him to defray our expenses to Birmingham and back. My Manchester depot got £3 out of the visitor, and a note agreeing to hand the money to our driver on his arrival at Birmingham. I instructed the driver very carefully not to let the car go out of his possession. He then started for Birmingham, picked our friend up at Manchester, and arrived at Birmingham that evening in splendid time. Unfortunately the squire had not arrived, and so our driver

From a Caricature in

The Marquis de Dion.

[Le Chauffeur.

did not have the pleasure of receiving the money that evening. At 11 o'clock next morning he was met by the hirer, and informed that he could not be found anywhere, and so he had sent the money on direct to our depot at Manchester, and handed him the receipt for the registered envelope. The driver telephoned me. I told him not to leave the place, and we awaited the arrival of the envelope at Manchester. In the meantime the hirer brought down another gentleman, and tried to sell the car to him. The latter, however, had a chat with our man, discovered that it was on hire, and told our man to take great care of the car, or else he might lose sight of it.

On the arrival of the registered envelope we found it contained a letter informing that £47 had been enclosed, which with the £3 paid as deposit made £50, but there was no money in it at all. I at once wired my man to telephone me, and he then informed me that the bird had flown.

I consider this most ingenious, as it seems a pretty easy thing for him to have sold the car for a low sum, representing the car to have been his, and the chauffeur his own driver, and then allowed the purchaser to find out his mistake after the astute seller had bidden the town farewell.

—Yours truly,

ARCHIBALD FORD.

### CHARGING ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you could give me some information as to charging accumulators. How ought I to proceed to charge 4-volt

accumulators from an electric light storage battery of 110 cells of a total of 286 volts? Can they be charged from the battery at other times than when the battery is being charged, as I have been told they take about eight hours to charge, and I believe the engine in this case is never running more than seven hours at one time, even in the shortest days? I should be very glad of any hints with regard to this matter.—Yours truly,

ANXIOUS.

[A reply to the query raised by our correspondent will be found elsewhere in the present issue.]

### WATER IN THE CARBURETTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Could you or any of the readers of the *M.C.J.* give me a hint for remedying water in the float chambers? The latter requires emptying out every day or second day after a thirty or forty mile run. After consuming, say, 8 gallons of petrol I find a teaspoonful in the float.

The car is a 24-30-h.p. Rochet-Schneider, and we have another identical with it, both being 1905 cars, and there is no trouble whatever with the second one.—Yours truly,

JOHN TOOLE.

[Our correspondent's trouble is doubtless due to water in the petrol tank, as it is almost impossible for it to get into the float chamber. We would advise that the petrol tank be thoroughly cleaned out, and see if any better results are obtained. Petrol should in all instances be filtered when filling the tank, as any small quantity of water will then rest on the filter and not pass through with the petrol. No doubt every precaution is taken by the firms supplying motor-spirit to avoid the nuisance caused by water in petrol, but it is no wonder that the trouble prevails, as we have personally seen within the past few weeks drivers of motor-omnibuses filling their radiators from petrol tins. On one occasion even the lubricator was being supplied with oil carried in a petrol can.]

### MORE ENGINE QUERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a twin-cylinder car with automatic inlet valves, and the car runs beautifully, and engine is all right but for a loud sucking noise, which I am told is the result of engine having suction valves. The carburettor has an automatic air valve, and the main air intake is a pipe about an inch diameter, running round to exhaust pipe, where it opens out tundish fashion. Is it possible to do anything to do away with this noise without affecting the power, etc., of the engine. The last two-cylinder car I had had also automatic valves, but this noise was not noticeable; this car had inlet and exhaust valves on one side, and the main air intake was close to the exhaust, and had a bell-shaped mouth with fine mesh netting cover. The new car has valves on opposite sides, and has a long way to fetch the air.—Yours truly,

OPENSHAW.

[The noise can be remedied by fitting a miniature silencer on the end of the air pipe. It consists simply of an enlarged chamber with one end perforated with sufficient small holes to more than equal the area of the air pipe, or a larger air pipe might in this instance effect a remedy. The automatic inlet valve has nothing to do with the noise.]

### SLIDING CHANGE-SPEED GEARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Much has been written recently with regard to the "gear grinding" attendant upon sliding change-speed gears. Although the system has been considered by many engineers as nothing short of barbarous, it is a curious reflection upon the fallibility of those too strongly reliant upon theory that this form should have survived the almost complete process of transformation that motor-cars have otherwise undergone during the past few years. Individual clutches, planetary gears, sliding keys and numerous other methods of coupling adjacent pinions without the necessity of sliding them into engagement have all been resorted to with indifferent success. It must be admitted, of course, that unless properly made the sliding gears can be quickly put into a bad condition, especially when handled by an incompetent driver. The extremely heavy wear to which the pinions are subjected on their engaging edges has, however, resulted in exhaustive study and experiment with a view to the production of material calculated to withstand this clashing and grinding, and as a result battered gear teeth are not now so frequently met with as in former days, and there is, moreover, far less shock and jar attendant upon the operation of speed changing. As I have already mentioned, many have been the attempts to supersede the sliding pinion of change-speed gear, but the latter still holds the premier position, and it would appear at the present time as if its supremacy will endure until the gearless car, after which so many are striving, has fully established itself as a practical vehicle.—Yours truly,

A. J. WILLIAMSON.

A RENAULT axle cap has been found at Farnborough and has been left with Mr. W. Plumbridge, Welclose, Farnborough, Kent.

## CLUBS AND ASSOCIATIONS.

## HERTFORDSHIRE.

A SUCCESSFUL motor-cycle open hill-climb was carried out by the Hertfordshire County Automobile Club on Saturday afternoon. Maple Hill, the scene of the meet, is a short stiff rise between Boxmoor and Chesham. Twenty-nine entries were received and twenty-three competitors satisfactorily completed the course. The following officials of the club superintended the arrangements, and everything passed off in good shape. Messrs. E. Kenealy, W. Whittall, and Dr. Gruggen, clerks of the course; Messrs. F. Straight and Dr. K. Hall, timekeepers; Messrs. C. McWhirter, E. Webster and J. T. Gardiner, marshals; Mr. N. B. Kenealy, judge; and Mr. T. Williams, hon. secretary. Subject to confirmation of the sports committee, the following is the result of the climb.

CLASS A.—Motors having a cylinder capacity of not more than 76 by 76 mm.

Machine.	H.P.	Bore and Stroke.	Entrant.	Min. sec.
Eland-Minerva ...	2½	76 by 76	W. Genn ...	34½

## KENSINGTON.

REPRESENTATION has been made to the Motor Union that it is desirable that a district club should be formed for automobilists in Kensington under the title of the Kensington Automobile Club, and at an informal meeting of a few local automobilists a provisional committee was constituted, consisting of Dr. W. Spencer Cox, Dr. L. C. Dobson, Messrs. W. H. Thompson, W. M. Forster, L. A. Bidwell, E. F. Philbrick, and J. Horace Reeves (secretary, *pro tem.*).

One result of their deliberations was seen on Thursday, the 26th inst., when a general meeting of Kensington automobilists took place at the Palace Hotel, Kensington, for the purpose of formally founding a club, adopting rules, and electing an influential and representative committee.

## IRISH MOTOR CYCLE UNION.

THE opening meeting under the auspices of the Dublin centre of the Motor Cycle Union of Ireland took place on Saturday. The programme was made up of three events and the contest was held at Portmarnock. The drifting sand and high wind made the course loose and rough in parts and told against fast times. H. Quinn won the novice race and was the first past the post in the ten miles handicap, but was disqualified for pedalling beyond the mark at the turning point on completion of the first mile, and the race was awarded to C. G. Lewis, who finished second, and who also accounted for the Members' Mile. Mr. J. G. Drury judged, Mr. Colman O'Connell timed, Mr. C. B. Franklin, in the absence of Mr. T. W. Murphy, started, and the arrangements, in

the hands of Messrs. Walter Keating, jun., hon. treasurer, and J. Shiel hon. sec., were up to the usual standard.

## ONE MILE NOVICE HANDICAP.—FINAL HEAT.

H. Quinn, 3-h.p. Triumph, 50 sec., 11 min. 45 sec.	...	1
F. Gill, 2-h.p. Minerva, 45 sec., 1 min. 48½ sec.	...	2

Won by fifteen yards.

ONE MILE HANDICAP, open to members of the Union. Machines unlimited as to h.p.

## FINAL HEAT.

C. G. Lewis ...	2 min. 2½ sec.	...	1
S. Black ...	2 min. 3½ sec.	...	2
A. J. Kettle ...	2 min. 3½ sec.	...	3

Won by five yards; a good third.

## TEN MILES HANDICAP.

Handicap framed from C. B. Franklin, 2½-h.p. F.N., as on scratch.

C. G. H. Lewis, 2½-h.p. F.N., 1 min. 30 sec., 19 min. 40 sec.	...	1
R. Howison, 2½-h.p. F.N., 3 min. 30 sec., 23 min.	...	2
S. Black, 2½-h.p. Buchet, 4 min.	...	0
W. Jacques, 3½-h.p. Alcyon, 2 min.	...	0
C. Kavanagh, 2½-h.p. Morehampton, 2 min. 30 sec.	...	0

H. Quinn, 3-h.p. Triumph, 5 min., disqualified for pedalling beyond the mark.

The Hertfordshire Club's Hill Climb. Hodgkinson ready to start on his J.A.P.

## MOTOR CYCLING.

THE Motor Cycling Club is organising a competition for the Albert Brown Trophy. It will be for cars only, and will be run over a circular course of seventy-five miles, which will have to be covered twice. Those cars will be eligible to compete of which the following parts are of British manufacture, viz., engine and transmission, frame, body and road wheels excluding the tyres. An average speed of not less than eighteen miles an hour will have to be maintained throughout the trial, and entries from members of the Motor Cycling Club will be received up to the 10th prox. by Mr. J. Van Hooydonk, Spring Villa, North Finchley, London, N.

## SOUTHERN.

THE Southern Club had a run to Horsham (Anchor Hotel) on Sunday last, where about twenty members arrived by different routes, the following being present:—Mr. and Mrs. H. Gutteridge (5-h.p. Peugeot); Messrs. H. Billing, 10-12-h.p. Humber, with hon. sec., W. L. Lorkin, on board; W. Nicholson, 7½-h.p. Humberette; H. P. White, 3½-h.p. Humber; A. Clifford Earp (6-h.p. Singer), B. Grottick (6-h.p. Stevens), T. Goodley (Phoenix Trim), W. Pratt (3-h.p. Fafnir). After lunch a start was made for home, calling at the Burford Bridge Hotel for tea. Everybody present was commenting upon the many police traps about, through which, however, all members came safely. The Club run on Sunday will be to East Grinstead (Railway Hotel).

## KENT.

THE first meet of the season took place on Saturday, the 21st, at Crown Point, Ightham, where an excellent tea was provided in the gardens adjoining the Sir Jeffrey Amhurst Hotel, a large marquee

being erected for the purpose. Among those present were the Chairman, Dr. Firth, and Mrs. Firth, Mr. Owen, Mr. and Mrs. Nash, on their new 20-30-h.p. Darracq car, exhibited at the recent Cordingley show. Mr. Bailey, Dr. Evers, Mr. Crook, Mr. Hall, on one of the new Italian cars, the Isotta-Fraschini; Mr. and Mrs. Gardner on a 40-h.p. Siddeley, Dr. and Mrs. McFarland, Mr. and Mrs. Batchelor, Mr. and Mrs. Norman, and the hon. sec. and Mrs. Kenyon.

The list of fixtures of the Kent Automobile Club includes runs to Folkestone, Sevenoaks, South Darenth, and St. Margaret's Bay, as well as invitation meetings at Dartford, Detting and Bromwich, the latter being by invitation of Sir David Salomons, Bart.

### NORTH LONDON AUTOMOBILE CLUB.

THE North London Automobile Club's second run of the season will take place on the 5th prox. to the George Hotel, Harpenden, where the first of the series of club competitions arranged for these outings will be held. Members should assemble at the headquarters, Fox Hotel, Palmer's Green, at 3 p.m. sharp.

### NOTTINGHAMSHIRE.

THE committee of the Nottinghamshire Automobile Club, owing to complaints received from members, have taken into serious consideration the nuisance caused by dust, and have passed a resolution to the effect that no club runs shall henceforth be organised by this club except in respect of private invitations.

Some car trials will be held on the Welbeck track on the 5th prox., by permission of the Duke of Portland.

### BLACKHEATH.

THE opening run of the season of the Blackheath A.C. will take place to-day (Saturday) to "The Beacon," Westerham Hill, Kent, where tea will be provided at five o'clock.

### LIVERPOOL.

THE rules and list of members of the Liverpool Automobile Club have just been issued. Messrs. Malcolm Blair and Vivian A. Simon are the hon. secretaries, and their headquarters are at the Exchange Station Hotel, Liverpool.

### AERO.

THE Aero Club balloon Vivienne III. ascended from the Crystal Palace on Saturday afternoon in charge of Professor Huntington. One of the occupants of the car was Dr. Zea de Forest, of New York, well known for his system of wireless telegraphy. The descent was made in Essex.

AN automobile club is being formed in British Columbia with two classes of members, viz., owners of cars and persons interested in automobilism.

SIR LINDSAY WOOD, Bart., of Allean, has joined the Western Section of the Scottish A.C.

THE North-East Lancashire A.C. are having their opening run of the season to-day (Saturday) to Blackpool.

### THE DUST PROBLEM.

MR. MERVYN O'GORMAN has summarised the result of recent observations with regard to the dust problem as follows:—

1. Sharp corners and excessive road cambers lead to slip, and, therefore, to dust.
2. More dust is raised by cars from a rough road than from an equally dusty road if it be smooth for an equal speed of travelling.
3. Watering the road moderately diminishes the dust. (It is noteworthy that many of the grumblers living by the roadside have not realised even this!)
4. Tarmac is one of the best anti-dust road surfaces. Tar-macadam, the spreading of crude oil on roads, the spreading of oil emulsions in water on the road, are important palliatives.
5. Wood, asphalt, cobbles, and setts are not dusty save after use by horse traffic.
6. Cars with smooth, boat-shaped under surfaces are less dusty than others.
7. Cars with flaring mudguards fitted with leather flaps near the road level are more dusty.
8. Cars on high wheels well clear of the ground are less dusty.
9. Cars with large tool boxes at the back reaching low down between the back wheels are dusty.
10. Large car bodies are in some cases dustier than small ones.
11. Blowing off the exhaust near the ground is dusty.
12. Cars fitted with engines having an insufficient fly-wheel or an ununiform turning effort from any cause are more dusty.
13. Cars whose chassis are mounted on very easy springs having a large up-and-down travel will suck up the dust with each rise and fall of the body on rough roads.
14. Front wheels—or rolling wheels—raise less dust than back wheels or driven wheels.
15. Smooth pneumatic tyres are dusty.

16. Solid or pneumatic rubber tyres are more dusty at higher speeds and with high-powered engines.

17. Non-skid devices, such as small steel studs, etc., not only do not increase the dust, but actually diminish it.

Amongst the instructive negative conclusions from experiments made by the Automobile Club are:—

18. That a car fitted with two long vertical dust screens placed near the ground between the road wheels and the chassis, and extending the full length of the car edgewise to the direction of travelling (i.e., arranged to prevent the dust-laden air thrown up by the road wheels from mixing with the air draught which passes underneath the car), showed no improvement from these attachments.

19. Horizontal screens fixed so as to closely embrace the driving wheel tyres, and adjustable to various heights from the ground, were tried, in the hope that they might throw back on to the road the dust-laden air raised by the wheels, and so prevent it from becoming entangled in the air eddies at the back of the car. No good result was obtained.

### ROAD REPORTS.

WARWICKSHIRE.—The County Council is about to undertake some experiments in road-making, the results of which will be of general interest. About 800 yards of the road from Stonebridge House and Packington Park—on the highway from Birmingham and Coventry—has been selected and is to be divided into sections, each of which will be made up with the following materials:—Mount Sorrel granite, Hartshill stone, Clee Hill stone, Tarmac and Leicestershire granite.

LEWES.—Attention has been drawn to the persistency with which the highways of Lewes are swamped with water during "a suspicion of dry weather."

HEREFORD.—Many motorists have remarked upon the comparative absence of dust on the roads of the county. They are almost entirely coated with Clee Hill basalt, a fact to which this freedom is locally ascribed. A length of tar macadam will probably be laid in the city of Hereford this year.

COBHAM.—Many stretches of road in the vicinity of Cobham are being laid with tar.

NOTTINGHAM.—This year 13,000 tons of tarmac are to be employed on the roads of Nottinghamshire. On the sections already laid with tarmac for three winters it is found there is practically no dust.

GAINSBOROUGH.—A length of nearly a mile of ordinary highway has been covered with Hooley's and Parry's tar macadam by the Gainsborough Rural District Council by way of experiment and to test the relative values of the two kinds of tarmac, one being made with slag and the other with blue lias limestone at a cost of about £1,013 per mile.

ESHER.—At the last meeting of the Esher and Dittons Urban District Council, it was reported that £2,612 had been expended on that portion of the Portsmouth road in the Council's district, comprising a length of about four miles. According to the surveyor the largeness of the amount was due in some measure to the increased motor-car traffic.

BRIGHTON.—A trial is to be made with tarred macadam in Sackville Road for a distance of 300 ft. The Surveyor has been granted permission to make extended trials of Akonia on the Front and on such other roads as he may think desirable.

NORTHWICH.—Successful experiments have been made near Northwich with a view to remedying the dust nuisance caused by motor-cars and other vehicles. Varying lengths of roads have been treated, with satisfactory results, for, although a continual stream of automobiles, cycles, and vehicular traffic had traversed the highways, practically no dust has been raised.

LEITH.—The Town Council of Leith has decided to carry out an improvement scheme on the road between the port and Portobello, which has long been in a very unsatisfactory state.

RENFREW.—The Renfrew County Council has adopted a suggestion by its road surveyor to the effect that it should bear the expense of the metal and of the spreading and rolling of five or six patches of about ten to fifteen lineal yards on the Cloch road as an experiment in the mitigation of the dust nuisance. Mr. Lang, quarrymaster, Gourrock, has offered to bear the expense of supplying the tar and mixing it with the metal in a machine he has patented for the purpose.

### CHANGE OF OWNERSHIP.

ON Monday, before the Blackpool magistrates, Joseph Dixon and Frederick Jackson were summoned for a breach of Article 4 of the Motor Car Registration and Licensing Order, 1903. The Chief Constable explained that the Act provided that if the ownership of a motor-car was changed, notice should be given, and an application made to cancel the registration of the car, or to continue the existing registration under the new ownership. For not doing this, they were liable to a penalty of £10. On August 21st the car was registered by Mr. Dixon, of 400, Lytham Road. On the 14th of the present month he (the Chief) received a message from the county police at Lytham, asking for the name of the owner of "F.R. 21." On inquiry it was found that Mr. Dixon had sold the car to Mr. Jackson some time ago, and the consequence was that the record of ownership was incorrect. The first defendant was fined 20s. and costs, and the second had to pay 10s. and costs.

# NEW COMPANIES REGISTERED.

**ENGLISH MERCEDES MOTOR COMPANY.** Capital, £100. No initial public issue. Registered without articles.

**PENNY MOTOR-BUS COMPANY.** Capital, £100. No initial public issue. Registered without articles.

**RYKNIELD MOTOR COMPANY.** Capital, £30,000. To acquire the business of the Ryknield Engine Company, Ltd., and to carry on the business of motor, locomotive, and wagon builders, &c. The first directors are Messrs. A. J. Clay, W. H. Clay, and F. A. Bolton. Ryknield Works, Burton-on-Trent.

**LONDON MOTOR FINANCE SYNDICATE.** Capital, £1,000. Financiers, concessionnaires, bankers, etc. 2, Coleman Street, E.C.

**LONDON ELECTROBUS COMPANY.** Capital, £100. To adopt an agreement with the International Motor Traffic Syndicate for the acquisition of certain options, contracts, and properties, and to carry on the business of motor-car, omnibus, van, and cab proprietors, jobmasters, and carriers.

**HALL, CAPRIS AND CO.** Capital, £5,000 (£1). To acquire and take over the benefit of two contracts between the Fabbria Automobili Isotta Fraschini, of Milan, and A. Capris, of London, relating to the representation of the first-named, for products of its manufacture for the United Kingdom, to adopt an agreement with A. Capris, H. E. Hall,

# MOTORIST ASSISTS POLICE:

WHEN summoned at Kingston for motoring at an illegal speed, Mr. Robert Kirke, jun., of Woodthorpe, Walton-on-Thames, was said to have travelled at the rate of 31½ miles an hour. Superintendent Marks mentioned that when the defendant was stopped the police received news of a motor-car accident in the vicinity, by which a Walton lady, who had been thrown out of bicycle trailer, was killed. The defendant placed his motor-car at the disposal of the police going to the scene, and rendered great assistance. The chairman said the bench would take into account the service that had been rendered, and would dismiss the summons on payment of the costs, 8s. 6d.

# PUBLIC MOTOR SERVICES.

A SERVICE of motor-buses is to be established in the Accrington district. The order for the vehicles has been placed with the Critchley-Norris Motor Company.

TENBY now possesses a motor-bus, which should have a prosperous season.

A SERVICE of motor-buses has been commenced between Hampstead Heath and Victoria (London) Station.

THE motor-bus service at Hastings is maintaining its usefulness.

Several of the 18-22-h.p. Beaufort brakes for the service between Poona and Mahabaleshwar, referred to in our issue of the 3rd March last, have now been received by the Western India Motor Co. The above illustration depicts the first vehicle starting on its initial trip.

and H. O. Hall, and to carry on the business of manufacturers of motors, cars, and other vehicles, etc. No initial public issue. Permanent directors, Messrs. H. E. Hall, H. O. Hall, and A. Capris. 60, Great Marlborough Street, W.

**MOTOR-CAR COPPERSMITHING AND APPLIANCES COMPANY.** Capital, £2,000. To take over the business of motor-car manufacturers, copper-smiths (in conjunction therewith), and makers of motor accessories lately carried on at 172-176, King's Cross Road, London. The first directors are Messrs. T. W. Smyth (chairman), L. Leroi, J. W. Bainbridge, and M. Domenech. 172-176, King's Cross Road, London.

# CYCLIST AND MOTOR-CAR.

AS the American Ambassador and Mrs. Whitelaw Reid, with an attendant, were motoring through Luton on their way from West Park to London, on Monday, their car was run into by a cyclist. The latter, a boy of fifteen, had a miraculous escape. The bicycle was wrecked, but the rider was not run over, though, his machine becoming wedged in the wheels of the motor-car, he was forced along the road. The motor-car was proceeding at a slow rate of speed, and the chauffeur was able to pull up within a couple of yards. Mr. Whitelaw Reid at once got out, and, together with those who had witnessed the accident, went to the boy's assistance. His condition causes no anxiety.

# MOTOR-CAR MISHAPS.

A MOTOR-CAR from London has run into some level crossing gates at Retford, smashing the gates and buckling its own framework.

MR. REGINALD KEMP, Deputy Coroner for West Middlesex, has held two inquests relating to fatal holiday motor accidents. The first was at Brentford on the body of John Norton, four years of age. The boy was crossing from behind a tram car in High Street, Brentford, on Easter Sunday when he ran into a motor-car being driven at eight miles an hour by John Glover. He died from a fractured skull the following day. In returning a verdict of accidental death the jury exonerated the driver from all blame. The second inquest, held at Hounslow, was on the body of Alice Surridge, five, who was knocked down by a motor-car owned and driven by Mr. Alfred Butts. Mr. Butts stated that he was driving at about ten miles an hour. The jury returned a verdict of accidental death, but censured Mr. Butts for going too fast, and added a rider to the effect that the speed of motor-cars along the Bath road generally was much too high.

# APPEAL ALLOWED.

AT Guildford on Saturday, before the Recorder (Mr. George Cave, K.C.), William Philpott, chauffeur to Mr. Cowley Lambert formerly

M.P. for Islington, appealed against a conviction by the borough justices. Whilst driving a car in London Road, Guildford, Philpott passed between a greengrocer's van and a Bath chair, with the result that the chair was overturned and a lady thrown out. The car was moving very slowly at the time. The justices inflicted a small fine, expressing the view that the chauffeur made an error of judgment in trying to run between the other vehicles when there was not sufficient room. The Recorder said if a driver, as in this case, exercising all the care he could, committed an error of judgment, he did not think that alone was sufficient to convict him of driving in a manner which was dangerous to the public. He therefore allowed the appeal.

### THE SCOTTISH RELIABILITY TRIAL.

THE entries received since the publication of the last list are as follows:—

The Enfield Autocar Company, Ltd., Redditch	20-30-h.p. Enfield.
The Euston Motor Company, London	18-24-h.p. Courier.
The London Motor Garage Company, Ltd., London	28-h.p. Double Phaeton "Pipe."
J. W. Stocks, London	15-h.p. De Dion.
D. McKay Drummond, Dumfries	20-24-h.p. North British.
Mrs. C. S. F. Loder, Ealing	20-30-h.p. Pilain.
The Bergins Car and Engine Company, Glasgow	16-h.p. Kelvin.

### A SCOTTISH TRAP.

A PROSECUTION, arising out of the police trap for motorists in Princes Street, has been heard before Sheriff-Substitute Hepburn Miller in Edinburgh Sheriff Summary Court. The accused was James Brown, consulting engineer, 7, Brandon Street, and the charge against him was that on April 1st he drove a motor-car at a greater speed than twenty miles an hour. A quarter of a mile had been measured off by one of the Burgh Engineer's men, and two policemen were stationed at each end of the measured distance, one at each end having a stop watch. Seeing the car approaching, the first policeman thought it was going too fast, and as it passed he set his watch, and afterwards seeing the other policeman further east, they compared watches, and found that the quarter-mile had been traversed in 39 sec., this working out at 23 1-13 miles an hour—three and one-thirteenth above the legal limit of twenty miles.

For the defence, accused said his car had two speeds—15 miles an hour and 20 miles an hour. He slowed down to seven miles an hour when turning from Lothian Road into Princes Street, and at Charlotte Street he was on second speed (15 miles) going about 15½ or 16 miles an hour. He never drove at top speed in Princes Street. Witness had tested his car a day or two ago on the Queensferry Road over a measured quarter of a mile, and the results were: Second speed, a little over 15 miles an hour, and top speed, practically 20. Professor Richard Stanfield, Professor of Engineering, Heriot-Watt College, was called. He said the handling of stop watches was difficult, and a quarter of a mile was not a reasonable distance for a test unless the watches were in the hands of experts. The policemen, he thought, ought to have been in sight of one another, and worked by signals instead of relying on the difference between the times on their watches, as they had done. Witness, after a test of the car, found it did 18½ miles an hour against the wind, and 21½ with the wind following. William Flint, cycle and motor agent, Edinburgh, also gave evidence, saying that a car of the make of the one owned by accused could go about 18 or 19 miles an hour, but they could not go more than 20 miles an hour on Princes Street.

Acting Sheriff-Substitute Hepburn Miller found the charge not proven. He said there was just sufficient margin of possibility of error in the use of the stop watch to enable him to acquit accused. The amount of error would only run to seconds, but in working out the calculation the matter of a few seconds on a quarter mile might reach important proportions when applied to miles per hour.

### POLICE TRAPS.

SEVERAL motorists have lately been trapped at Fishergate, Southwick, making their subsequent appearance at Shoreham Petty Sessions.

THE Talbot red confetti device is obtaining an amount of commendable imitation, as several sets of operators were evidently at work during the holidays. Mr. C. R. Garrard discovered a trap between Slough and Maidenhead, and, curious to see if motorists were readers of the motor press to an extent which would make them understand the danger signal, he drove his car up a lane and sat down to watch the effect of the police trap. In the course of half an hour three drivers came along and each one immediately throttled down on perceiving the warning paper. Highly satisfied, he set out for fresh fields to conquer, and discovered another trap near the thirty-fourth milestone from London on the Wickham-Oxford road, where he found an unfortunate victim in the toils of the police.

AT Washington (Sussex) police energy against motorists has been most marked of late.

LANCASTER.—There is a quarter-mile trap on the level road between Carnforth and Milnthorpe.

### MOTOR-CAR v. DOG.

AT the Croydon County Court, an action has been brought for damages for the loss of a dog which was killed by a motor-car running over it at Croydon. Mr. Chamberlain appeared for the owner of the dog and Mr. Staplee Firth defended for Mr. Percy, the motorist. Mr. Firth said the real question for the Court to decide was whether the defendant had been guilty of any acts of negligence, as it was necessary to prove this in order to recover anything for the loss of the dog. The judge said in the course of his summing up that a motor-car had as much right to be on the highway as a dog had, and there was an obligation on the owner of a dog to see that it was properly trained and under proper control, otherwise he could not hold anybody liable for any damage that might come to it, and he ultimately held that the plaintiff had failed to establish his claim and that there must be a verdict for the defendant with costs.

### CASES AGAINST MOTORISTS.

BEFORE Mr. Paul Taylor, at Marylebone, a chauffeur named J. Wm. Brincklow has been charged with being drunk while in charge of a motor-car at Malden Road, Kentish Town; and also with recklessly driving the car and being concerned in assaulting P.-C. Geo. Sadler, 327 Y, by throwing him out of the car. It appeared that the previous night the prisoner drove his car on to the pavement in Malden Road, and the constable having called to him in vain to stop, jumped on to the car. He was, however, at once pushed out by the prisoner and another man riding with him; but he clung to the car and held on for a distance of about 200 yards, when, owing to the car gaining in speed, he was obliged to let go. The prisoner then drove away in the direction of Hampstead, but apparently he did not know where he was going, for some time afterwards he returned, and the constable met him and again jumped on the car. As he did so the prisoner put his hand on the lever. The constable promptly pushed his hand to knock it off, and in doing so he brought the car to a standstill. The prisoner said he was very sorry for what had happened, and pleaded guilty. Mr. Taylor ordered a remand, and allowed bail in £50.

THE Hon. Stephen Coleridge appeared to answer an adjourned summons, at Marlborough Street Police Court on Tuesday, for having, on March 10th, in Hyde Park, driven his motor-car at a greater speed than ten miles an hour. Mr. Coleridge pleaded not guilty. Sergeant Fillee in his evidence said over a measured distance defendant's car exceeded a speed of nineteen miles an hour. Cross-examined, the witness said that Mr. Coleridge was not driving to endanger or inconvenience anyone. Mr. Stewart, of Hodd-son, said he was in the car and did not think the speed was anything like that stated. Mr. Coleridge stated that he was prepared to plead guilty to over ten miles if the police withdrew their assertion of nineteen miles an hour. Mr. Denman observed the only question was whether the speed of ten miles an hour was exceeded, and that was admitted, but it appeared not to be a danger to anybody. The fine would be 20s. and 2s. costs. Mr. Coleridge asked that his licence should not be endorsed, and mentioned that he had persuaded the Farnham magistrates not to do so. Mr. Denman said that would be under another Act. In this case he had no option but to endorse the licence. The question had been often raised before and had been thoroughly threshed out.

Place.	Summoned for	Result.
Lancaster ...	Five cases of exceeding the speed limit	£5 to £7 10s.
Prestbury ...	Dangerous speed	£5.
Kingston ...	Reckless driving	£10.
" ...	Five cases of exceeding legal limit	Fines ranging from £3 to £10.
Richmond ...	Exceeding limit in Richmond Park	£5, etc.
Pembroke Dock ...	Dangerous driving	£5, etc.
Peterborough ...	Furious driving	£2, etc.
Loughborough ...	Furious driving	40s., etc.
Steyping ...	Dangerous driving	£4.
Marlborough St. ...	Exceeding regulation limit in Hyde Park	20s.
Richmond ...	Exceeding limit in Richmond Park	£3.
Hove ...	Negligent driving of motor-bus	21s., etc.
Eastbourne ...	Dangerous speed on the Grand Parade	£3, etc.
Horsham ...	Two cases of dangerous driving	Both dismissed.
Shoreham ...	Several cases of exceeding speed limit	Fines from £3 to £8.
Eastbourne ...	Dangerous speed	£3, etc.
Brighton ...	Dangerous speed	£5.
Waltham Abbey ...	Exceeding legal limit	£2, etc.
Blackpool ...	Driving a tri-car dangerously	20s., etc.
Eccles ...	Furious driving	£5.
Altrincham ...	Reckless driving of motor-cycle	£2.

## COMMENTS.

**A**MONG the Budget matters of particular interest to motorists was the announcement by Mr. Asquith that he proposed to reintroduce legislation to facilitate the use of alcohol for industrial purposes. This is a matter of considerable importance, and although the agitation which went forward a year or two ago seems to have lost its vigour, the subject merits continued notice and study. True, the conclusions reached by the committee that was appointed were somewhat halting and inconclusive, but all must be anxious to see the field of experiment widened in order to secure results of national value. The announcement made by the Chancellor of the Exchequer on Monday should revive interest in the matter—to the benefit of the nation at large.

### Club Runs.

THE organised club runs which have been held from time to time have undoubtedly proved of great educational value in the development of the automobile industry, but the time has now come when their necessity is no longer apparent. More than that, the number of members of such organisations is now so large that the pre-arranged processions of their motor-cars give the appearance of a great invasion when they come in sight enveloped, as too frequently happens, in clouds of dust. Hence we welcome the decision of the Scottish, Manchester and Nottingham clubs to depart from their custom of organised club runs, the members being contented to make their own way to some appointed rendezvous. So far as the former club is concerned, these places of assembling have been selected with special regard to the convenience of members resident in the various districts north of the Tweed.

### Motor Racing on the Sands.

THE Yorkshire Automobile Club held a meeting, attended by representatives from the Halifax, Huddersfield and Cleveland Branches, last week, to discuss the question of Speed Trials for 1906. For some time the Club has endeavoured to find an inland track suitable for high speed racing, but up to the present time without success. Nothing definite was done at the conference, but the sands between Saltburn and Marske-by-the-Sea, on the Yorkshire coast, were suggested as a possible venue. Messrs. Dickie and Shaw, who attended the meeting on behalf of the Cleveland Branch, gave particulars of these sands. They were stated to be firm and dry, and it was possible to get a course of four miles in length. When the tide is low there is a course width obtainable of about one sixth of a mile. In addition to this the sand dunes on the coast would form an excellent point of vantage for spectators to view the race without unnecessarily crowding on to the sands. However, a deputation was formed of members of the Club and the affiliated branches to visit Saltburn on May 5th, with a view of

ascertaining whether the sands there would be capable or not for high speed motor racing. In the event of the deputation being satisfied as to the suitability of the sands, the necessary authorities would be approached for their sanction to hold such a meeting.

### Dealing with Fire Risks.

WE understand that the London County Council and the other authorities concerned with the government of the Metropolis are now supplying the various stations of the Fire Brigade with supplies of sand for the extinction of petrol fires; it is being suggested in some quarters that stores of sand should be available in busy streets in the same way that gravel is now kept for use on greasy surfaces. Others are advocating that motor-buses should also carry a supply of sand for their own use should occasion arise. Although there is no need to make cause for alarm, all motorists will welcome any steps taken by the Fire Brigade to adapt itself to the changing circumstances of the time.

### The London Fire Brigade.

MEANWHILE it is pleasing to note that the motor fire engine is justifying its adoption wherever it has been installed, and that the experience of Glasgow, Edinburgh, Liverpool, Cardiff, Cape-town and elsewhere should hasten its triumph in the Metropolitan area. At present London has motor fire engines at the Southwark Bridge Road headquarters, at Battersea, and at Wapping. Another has just been ordered, while an innovation has been suggested in a contract made for the conversion of a horse-engine into one propelled by mechanical means. Three motor-escapes are also being made for the brigade, which at present possesses one, stationed at Lee Green. The motor fire engine has several advantages over the horse. It is cheaper in the long run, though the first cost is greater. It will save the space now occupied by stables, and it adds one to the number of men available for attacking fires, the driver being at liberty when the machine is not working, whereas when horses are used the coachman has always to stand by them. The self-propelled vehicles are more capable than horses of high speeds, and although this argument is, perhaps, not so cogent in the narrow, crowded streets of the City, it has force when we consider the suburbs.

### The Promise of May.

ON Tuesday last the entries for the Scottish Reliability Trials closed at ordinary fees, and will finally finish by the 21st inst., so that intending competitors in a most interesting and important event must not long delay their decision. In a few days the entries for the Auto Cycle Club's Land's End to John o' Groat's trial will close. During the month several useful gatherings of motorists will be held, including the first provincial meeting for the year of the Motor Union. This will take place at Birmingham on the 26th inst., two days after the Herefordshire Club's hill-climbing contest on Frome's Hill. The Auto Cycle Club will hold a hill climb at Haslemere on the

19th, and the selection trials for the International Cup race are arranged for the 31st. The Cardiff Club will have a motor-cycle hill climb on the 9th inst., and the annual meeting of the North Wales Automobile Club takes place on Monday next. Competitions are also to be held during the month by the clubs of Essex, West Surrey, North-east Lancashire, Lincolnshire, and North Herts. The Yorkshire Club will join with the Cleveland branch at Boroughbridge, the Manchester Club will stay at Church Stretton for the third week end of the month, and Metropolitan interest on the 19th will centre about the North v. South competition for the Gamage Cup, which will take place on the Bath road.

### Scottish Humour.

SHERIFF M'LEOD might be qualifying for the succession to Mr. Justice Darling, judging by his verdict in a motor-car case which has just come before him in the Sheriff's Court at Haddington. The police trapped their victims with the aid of ordinary commonplace watches—a method which the Sheriff, avoiding legal jargon, declared to be "a bit rough." Still, he considered it sufficient for the joy of conviction. Then came the question of the price to be paid, which was ultimately assessed on what has become known as "the Prince's Street tariff." The particular trap is situated between Haddington and East Lothian, the measured distance being one mile. Evidently the Scottish Automobile Club has plenty of educational work yet to do.

Mr. J. L. Cross, of Clarebank, Bolton, on his 22-28-h.p. Crossley Car. The vehicle is fitted with a handsome side entrance Roi des Belges body with Cape cart hood and folding wind screen on dashboard.

### The Roads in Wales.

THE Carmarthenshire County Council has starved the roads for a considerable period, and deep layers of new metal have been distributed over them and left to be rolled in by the traffic. So far as motorists are concerned, the roads have become so bad that doctors have had to dispose of their cars. One member of the public, not a motorist, has written complaining of the state of things to the Local Government Board, and has offered to bear the entire cost of an inquiry into the condition of the roads, but the reply of the Board has been that they have no power to hold such an inquiry. The Motor Union thereupon arranged that the roads should be inspected by Mr. Howard Humphries, M.Inst.C.E. The whole of the papers and Mr. Humphries' report have been placed before Mr. Danckwerts, K.C., for his opinion. Mr. Danckwerts's opinion has not yet been received, but should he advise that the case against the Carmarthenshire County Council is sufficiently strong for an action, the Motor Union are disposed to commence legal proceedings against the Council, unless an undertaking is given by them to place their roads in a proper condition of repair. Should the

proceedings be commenced, the Union would raise a guarantee fund of £300, and head the list with a subscription of £25. The Roads Improvement Association have already promised £10 to the fund. The Union would raise £150 in London, leaving a balance of £150 to be locally subscribed in South Wales. In any event the Union are determined not to allow the matter to rest until the County Council have remedied the conditions of which such serious complaints have been made by their members.

### The Conveyance of Cars.

RAILWAY companies are beginning to recognise the conveyance of motor-cars as a source of revenue worthy of cultivation. The Midland Railway Company is the first British line to put into traffic a covered truck specially designed for the conveyance of motors over their line. These vans are fitted with side and end doors, the latter being so arranged that the largest cars can be conveniently and easily loaded. The trucks are 31 ft. in length, 8 ft. in width, and are as high as they can be built within the loading gauges. Sliding bars are fitted along the insides of the vans, to which motor-cars or road vehicles of any description can be secured. Strong leather straps are used for securing the wheels and other portions of the cars to the bars in question. The vans are large enough to hold two motor-cars or one car and a large brougham; they are well ventilated, having ventilators on both sides, and special precautions have been taken to prevent dust coming in through the ventilators.

### Trinidad Petroleum.

SIR NEVILLE LUBBOCK presided recently at a meeting held at the West India Committee Rooms, London, to hear an address from Mr. Randolph Rust on the discovery of petroleum in Trinidad. Sir Henry M. Jackson, the Governor of the Colony, in a letter to the chairman, expressed his sense of the importance of the discovery in view of the fact that modern warships are being fitted to burn oil fuel, and here was a supply within easy reach that could be kept exclusively in British hands. Mr. Rust stated his explorations in the tropical forests of Trinidad had led him to discover that there were enormous deposits of oil underlying some 400 square miles of land. The crude oil contained a very large percentage of petrol and a very high percentage of illuminating oil.

### Dust.

THE dust is apparently always with us—except when the rain converts it into mud. Perhaps the most satisfactory feature of the position is the attention which various organisations and societies, as well as local authorities, are giving to the subject with the desirable object of finding a remedy for a state of things which has been universally condemned. We learn that the Association of Cleansing Superintendents is to discuss the matter at its annual congress in June, and other societies of a better known character are also giving it attention. This, combined with the many experiments now proceeding under the auspices of local and county authorities, should result in some tangible depreciation of the effect of the dust nuisance ere long.

### The Motor Union.

Now that motorists are again upon the roads the present month seems a favourable opportunity of referring to the work of the Motor Union, which is doing great service to the movement by defending members when before the courts. Of course it cannot render assistance in every instance; its utility to help at all is limited by its resources. These have lately been depleted by the defence of several important cases, and it behoves every motorist to support the Union, not only by proclaiming his association with the organisation but in a

financial way as well. Motoring having had a legislative respite, this is the fit and proper season to create a strong organisation which shall be fully competent to withstand any attacks that may be made upon the hardly-won privileges of its members.

### The Irish Club House.

THE opening ceremony in connection with the new club premises, motor-house, and garage took place on Monday, and is referred to in our Club News. The building recently acquired by the Club adjoins the old garage and rooms, with an additional advantage of an opening in Dawson Street, and providing sufficient accommodation for the present membership roll and still capable of further extensions when occasion requires. The additional premises taken over by the club at a

place to Gorey, 61 miles, and back. There will be six classes for petrol vehicles and one for steam cars. Only amateur drivers will be allowed to take part in the contest, entries for which close on the 16th inst. at single fees, and on the 30th May at double fees.

### The Driving Examinations.

IN our issue of the 21st ult. we gave some of the questions which were asked in connection with an automobile examination in New York. These may be supplemented by some specimen questions in the A.C.G.B.I. examinations for driving certificates as follows:—1. At what speed may you drive through towns and villages? 2. If you had an accident on the road describe fully what you would do? 3. What is the meaning of the "white ring" sign? 4. What are the L.G.B.

Photo by]

[Chancellor.

cost of £3,000 will, when complete, be one of the finest and most up-to-date motor-houses and garages to be found in the sister isle, owing to its proximity to the Stephen's Green Club and the United Service Club, and on the requisition of members of the Automobile Club, who are also members of one or other of the aforesaid clubs, special entrances have been arranged, by which those frequenting one or other can have free access to the motor-house and garage by private entries.

### An Irish Trial.

PREPARATIONS are well in hand for the reliability trial to be organised by the Irish Automobile Club in June next. Dublin will, naturally, be regarded as the headquarters for the competition. On the first day the run will be to Carlow, 49½ miles, and back to town; Dundalk, 51 miles, will be the objective on the second day; and the last run will take

Regulations as to driving backwards? 5. On temporarily leaving a car, what precautions are you required to take under the L.G.B. Regulations? 6. Name the offences under the Motor Car Act, 1903, for which a driving licence can be endorsed? Surely replying to such queries need not entail a heavy fee?

### Cars Across Footpaths.

DESPITE the efforts made by motorists to propitiate the people of Blackpool with regard to automobiles, there are folks in the town who do not seem to have an abundance of friendliness towards those who practice "the gentle art" of pushing the car. A gentleman, in order to get his vehicle into a garage, pushed it across the footpath, thus demonstrating the truth of Euclid's proposition that the nearest distance between two points is a straight line. But the Chief Constable, Mr. J. C.

Derham, is apparently not of a mathematical bent of mind, and he summoned the calculating motorist for obstruction. The last occasion upon which we saw Mr. Derham was at the time of the Blackpool speed trial, when he ran up and down the track with all the excited enthusiasm of a new convert and appeared to revel in the joy of the motor car. In this case he may have regarded the mere pushing of a car as a slight to the memory of the feats of Earp and Cissac on those memorable days. On no other ground can we explain his attitude in Court after the magistrates had rightly decided that no obstruction had been caused, and very properly dismissed the case. Chief Constables must temper their authority with common sense—even when motor-cars are concerned.

#### Warning Motorists is Legal.

IN our last issue we made brief reference to a case at Croydon, which was decided as we went to press. This, it will be remembered, was concerned with a gentleman who, by warning motorists, of a police trap in his locality, was able to prevent possible offences against the law. For this he was summoned by the police on the ground that such action was an obstruction of their legitimate calling. It is satisfactory that the Bench should have taken a different view of the matter, as otherwise any motorist who gave a friendly warning to another traveller as to police activity would be at the mercy of these limbs of the law. Often have we urged that the proper function of the police is to protect persons and property rather than to play hide-and-seek with those who journey on the highway. So long as they are content to spend their time at the latter sport their would-be victims will be ready to give a friendly hint to others of police activity. This is only natural; and it is satisfactory to know that such a natural feeling is also a legal one.

#### The Length of Traps.

WHILE referring to this matter, the decision of the Chertsey magistrate to dismiss a summons against a motorist, because he regarded the police trap in which he was captured as too short to give a fair indication of speed, may be fitly reviewed. There are certain chief constables who have always been averse to the "furlong trap," on the grounds that such a short distance was hardly fair, as the second or two that the police might be out in their calculations would considerably affect the rate of mileage per hour. But at Chertsey another view has been entertained by the police, and a trap of 176 yards was set for passing motorists by the redoubtable Inspector Jarrett. It is satisfactory that the magistrate should have dismissed the case, and expressed the view that such short traps were unfair. If the speed of motorists is to be ascertained, it should be taken over a distance of a few miles on a give and take road. This is, of course, under the present regulation as to speed limit; but future legislation will doubtless remove this anachronism, and the police methods now in vogue will then be regarded as the petty persecution so often shown to new movements which are calculated to be of public service.

#### Crossing to the Isle of Wight.

MOTORISTS crossing to the Isle of Wight will be interested in the facilities possessed by the London and South Western Railway Company for handling cars at Lympington. The boat journey from this place to Yarmouth, on the island, is the shortest and least expensive; moreover, both at Lympington and at Yarmouth the cars are run down a slipway on to a specially constructed boat, thus avoiding the necessity of swinging them aboard the steamers. The ordinary boat leaves Lympington at 11.30 a.m. and that from the Isle of Wight at 1.30 p.m. Never before have so many cars been seen on the island as this season, while the effect of the motor-buses which have been put in service is seen in the promised reduction of train and coach fares.

#### Motor-Cars and Property.

STRANGE and somewhat contradictory are the views expressed by house and estate agents with regard to the effect of the motor-car on property. Naturally those whose houses abut on the main road are bemoaning the dust on the road that is disturbed by passing cars, while one gentleman declares that motor-buses "are decimating the residential tenants of the upper floors along the road." On the other hand, some interested in suburban property declare that they are encouraging people to go a little further from the main ways of great cities, and so developing new districts, to the advantage of the builder and other people of like occupation. Both cars and buses have contributed to this end, and, after all, it is really a diversion of interest that has taken place.

#### No Special Roadway for Motor-Cars.

MR. B. H. THWAITE, C.E., has been reiterating, in the columns of a daily paper, his view that the remedy for the dust nuisance is the establishment of motor-ways for high speeds and enforced slow speeds on the public highways. Very few motorists will be found to concur with the conclusion that seems to naturally follow such a contention. All agree that the success which has attended the automobile movement during the last decade is small compared with the possibilities of the next few years; therefore to legislate on lines which are calculated to bolster up the existing slower forms of traffic is neither economical nor wise. We must be prepared to look ahead towards the time when mechanical traction will be the rule and horse-drawn vehicles the exception on our highways. There must be no differentiation between the two classes of traffic, for the endorsement of the view advocated by Mr. Thwaite appears to imply that motorists would have to bear some of the cost of roads specially prepared for their benefit. They are entitled to use the public highway, and the authorities must adapt it to the growing and changing circumstances of the time.

FULLY 120 members of the Institution of Engineers and Shipbuilders visited the works of Argylls Motors, Ltd., at Alexandria on Saturday.

MESSRS. H. W. HOBSON, LTD., the British agents for Decauville cars, have removed their offices, works, and garage from 85, King's Road, Chelsea, to 29, Vauxhall Bridge Road, London, S.W.

ON the way to the Midlands last week, *via* the L. and N. W. Railway, we noted that Messrs. Aster, Ltd., are erecting works at Wembley, Middlesex, for the manufacture of Aster engines and components.

AT the Canning Town track, on Monday, G. A. Barnes, riding an 8-h.p. twin-cylinder Aleyon motor-bicycle, covered 54 miles 1,620 yards in the hour. The previous best was 54 miles 523 yards by C. R. Collier.

JUDGING from our experience the other day, it would seem as if more assistance were needed in the Motor-car Department of the London County Council at Spring Gardens. At the time of our visit to renew a driving licence no less than eight persons were waiting to be attended to, and there were three clerks in the office, yet only one of them was on duty at the counter.

The "Fascinating Mr. Vandervelt," which is presented at the Garrick Theatre, London, by Messrs. Arthur Bouchier and Charles Frohman, should prove of more than passing interest to motorists. At the conclusion of Act 2, Lady Clarice is induced by the fascinating one to go a-motoring. Act 3 opens at a country inn, where they are stranded owing to a series of mishaps and disasters which have been most elaborately arranged by Mr. Vandervelt. The result of the plot to the schemer is not satisfactory, woman's wit assisted by a parson, who turns out to be a very bad chauffeur, defeating the end he had in view. Mr. Sutro in writing the play has shown himself to be a practical man, as far as the gentle art of motoring is concerned.

## MOTORIZING IN A STRIKE REGION.

**J**UST as the photograph has been added to the equipment of the national historian anxious to reproduce scenes for the education of future generations, so the motor-car is being utilised for the prompt study of important events at close range.

It has long been recognised as the ideal conveyance in which to see the country; it is now being employed by those who follow the course of current events far removed from the ordinary means of locomotion.

An instance of this has just occurred in the United States, in connection with the recent great strike in the coal regions. A motor-car trip was organised by Mr. E. C. Johnson, of Philadelphia, and with a quartette of companions he set forth from that American town on the 2nd ult. on his trusty White steam car. Journeying by way of the suburb of Bryn Mawr to

towards the coal regions, the tour took on the aspect of an endurance run. With half a dozen railways running through the coal regions, it has evidently never occurred to anyone to do any work on the roads—at least, so it seemed to the tourists. When near Tamaqua the first collieries were seen, and for the next three or four days the party was never very far from a mining settlement. The road out of Tamaqua towards the north is one which is well worth traversing. A torrent with innumerable cascades parallels the road. Mountain peaks are lined against the sky in every direction, and many times the tourists stopped their machine in order that they might admire to the full the great natural beauties with which this locality is endowed.

After a great range of hills had been crossed, the tourists looked down into the valley and saw the towering coal breakers of the towns of McAdoo, Audenried, Jeanesville and Hazleton. On reaching these settlements a number of men were seen work-

Paying Toll at Quakerstown.

Valley Forge, the tourists visited Washington's headquarters and the other places of historic interest near that famous camp site. Then, proceeding irregularly across country to Reading Pike, the party continued through Pottstown and Douglassville to Reading. This was followed by a trip due north up through the prosperous Berks county, which is closely dotted with communities of marked German characteristics.

Hamburg, a little town of some 2,500 inhabitants, sheltered the tourists overnight. The party observed with interest that the leading citizen, and the one who dominated the town, owned an automobile, and they felt that when the time comes that each little township possesses a machine owned by a man of such social calibre, the anti-automobile sentiment which is said to prevail in the rural districts will entirely disappear.

Early on the following morning the tour was continued to Pottsville. As far as this town the tourists had met with rather fair roads, but as soon as they turned off sharply to the east at Pottsville from the main highway and directed their course

ing around the mines, but they were careful to exhibit their "working buttons" and to explain that they were doing only such work as allowed by the union. The Russians and the Huns, who comprise the majority of the mine workers in this locality, were inclined to be orderly, pending the result of the conference in New York, and there was but little excitement in the region.

After spending the night at Hazleton, Mr. Johnson and his companions continued through the coal mining settlements of Harleigh, Ebervale and Jeddo, descended the dangerous snow-covered road which goes precipitously down the Eckley Mountain to White Haven. From White Haven to Bear Creek they went over a stretch of fifteen miles, during which they saw not a sign of human habitation. This road evidently lies at a considerable altitude, as the vegetation which flourishes there is very scant. From Bear Creek it was but a short ride to Wilkes-Barre, and the tourists approached the latter town down the road which is to be the scene of a hill-climbing

contest during the Wilkes-Barre Centennial this month. The motorists were interested in the qualifications of this hill for a contest and accordingly ascended it next day. The road is about a mile long, with a number of turns which, although rather sharp, particularly that known as the "Devil's Elbow" (resembling in some respects the Scottish turn of that name), are still sufficiently wide and well banked to be safe. This inspection trip being completed, the tourists again turned their attention to the strike situation. The territory around Wilkes-Barre, known as the Wyoming Valley, was ablaze with excitement. The mines in that region are manned mostly by Italians, and some of the collieries were endeavouring to carry on work with non-union labour. The State Constabulary had been called out, and a company of fifty strong were patrolling the valley protecting life and property.

The tourists soon learned that it was best for them to keep in the company of the details of the constabulary, and in return for this protection they were able to render numerous services in the way of carrying ammunition and in distracting the attention of the idle miners from the movements of the troops. The stockades which surrounded some of the collieries were very interesting. These were built of heavy timbers, topped with several lines of barbed wire, and armed guards employed by the companies were on duty behind them day and night. Riots of

The State Constabulary escorting the Motorists on their "White" car.

more or less importance were reported almost hourly from different parts of the district, and the constabulary had their hands full, as they were outnumbered almost a thousand to one. Had they been provided with automobiles, as were the tourists who were watching their movements, they would have been able to have covered a great deal more territory in much less time, with a corresponding increase in respect for the law on the part of the hot-headed foreigners.

After two days of exciting expeditions around the Wyoming Valley, the party left Scranton on the Friday afternoon. They pushed on hurriedly through the quagmire of the dreaded Scrub Oak Mountain, and of the all but impassable marsh near Tobyhanna. Taking supper at the latter town, they continued their way aided by the light from the friendly moon, over Mount Pocone, down its steep southern decline to Stroudsburg, and finally to Bethlehem, where they arrived after midnight. After seizing a few hours of much-needed sleep, they were on their way again early in the morning, and arrived at Philadelphia at the end of the week, somewhat fatigued because of the arduous nature of their trip, but well pleased that they had successfully accomplished what few would think of undertaking at this season of the year.

MESSRS. THOMAS TILLING, LTD., have erected a motor-omnibus depot at Lewisham.

## CONTINENTAL NOTES.

### Another German Touring Competition.

The Automobile Club of Cologne is organising a touring competition for the 19th and 20th May, the first day's journey being from Cologne to Saalburg and back to Ehrenbreitstein, a distance of 270 kilometres, and the second from Ehrenbreitstein to Cologne via Gemund, Bruck and Düren, 192 kilometres. The competitors will be divided into five classes as follows:— (1) cars up to 14-h.p.; (2) cars up to 20-h.p.; (3) cars up to 32-h.p.; (4) cars up to 45-h.p.; and (5) cars over 45-h.p. The awards will be on a point basis, marks being deducted for stops for repairs or adjustments, water replenishment, etc. No marks will be deducted for the first stop owing to a puncture, provided that the delay is not more than twenty minutes, one mark being taken off for each minute in excess. For any subsequent stop on account of tyre troubles three marks will be lost, these allowing a twenty minute delay. The cars in Class 1 will be required to attain minimum and average speeds of respectively 21 and 25 kilometres per hour; Class 2, 25 and 29 kilometres; Class 3, 28 and 33 kilometres; Class 4, 30 and 36½ kilometres; and Class 5, 32 and 40 kilometres. The entry list will close on May 10th.

### The Targa Florio.

Sunday next is the date fixed for the great Italian touring competition known as the Targa Florio, which is to be run off on a circuit on the Island of Sicily. The entries are as follows:—

No.	Car.	Driver.	No.	Car.	Driver.
1.	Hotchkiss	Le Blon	11.	Renault	Ravetto
2.	Clement-Bayard	Letellier	12.	Fiat	—
3.	"	A. Fournier	13.	Vulpes	Barriaux
4.	Itala	De Caters	14.	Itala	Graziani
5.	"	Cagno	15.	"	Tasca
6.	"	H. Fournier	16.	"	Fabry
7.	Darracq	Hemery	17.	Zust	Rigal
8.	"	Wagner	18.	San Giorgio	—
9.	La Buire	Mottard	19.	Fiat	Lancia
10.	Berliet	Bablot			

### Motoring in Switzerland.

An important conference of representatives of the different cantons in Switzerland has just been held at Berne to consider the question of automobile traffic in the country. It was decided to fix a blue sign on the roads where motorists must slacken speed and a yellow sign where motoring is not allowed. The Department of the Interior has been deputed to draw up a uniform code of rules for the guidance of police deputed to take charge of the roads. No decision was arrived at as regards uniformity in fines for infraction of the regulations, but steps are to be taken to put an end to the abuses to which it is alleged the police have subjected motorists. A resolution was furthermore adopted to the effect that no road is to be closed to motor-cars without an agreement between the authorities of all the cantons concerned, and that all foreign motorists shall be given a copy of the regulations on entering the country.

### A German Motor-Cycle Reliability Trial.

The German Motor Cycle Union is organising a reliability trial for motor-cycles over the course on which the Herkomer Touring Trophy contest is to be held. The motor-cycles, whose number will probably be limited to sixty, will start a day later than the competitors in the Herkomer event.

### The Elastic Wheel Competition.

In our last issue we left the four remaining competitors in this event at Marseilles. The run on the 24th ult. was from that town to Valence, a distance of 137½ miles. All the cars safely completed the journey, the order of arrival being the De Dietrich (Edmond-Levi wheels), 24-h.p. De Dion (Soleil wheels), 20-30-h.p. Renault (Garchey wheels), and the 14-h.p. De Dion (Ducasble tyres). On the 25th ult. the run was continued to Dijon, 183 miles, when the number of competitors was reduced to three, due to the 14-h.p. De Dion with Ducasble tyres retiring owing

to a broken cardan shaft. The final stage—Dijon to Paris, 207 miles—was completed on the 26th ult., the first to reach the French capital being the 20-30-h.p. Renault (Garchey wheels), followed by the De Dietrich (Edmond-Levi), and the 24-h.p. De Dion (Soleil). The total distance covered in the trial was 1,345 miles, and this was covered by the three successful competitors in the times shown below:—

	Wheel.	Time.	Average miles per hour.
24-30-h.p. De Dietrich ...	Edmond-Levi ...	72 h. 10 m. ...	18.6
24-h.p. De Dion ...	Garchey ...	82 h. 18 m. ...	16.3
20-30-h.p. Renault ...	Soleil... ..	92 h. 3 m. ...	14.6

In addition to the Halle, England was to have been represented in the event by a car fitted with the spring wheels of the Spherola Spring Wheel Co., Ltd. The vehicle was, however, so badly damaged in landing that it could not be got ready in time for the start of the competition.

#### The Grand Prix Race.

So far thirty-five entries have been received for the race for the Grand Prix de l'A.C.F., which is to be held on June 26th

25th the cars will be required to make several rounds, the number varying according to the class, of a 10-mile circuit in the district, while on the 26th inst. a kilometre speed trial and a brake test will be held. Full particulars of the competition can be obtained from the secretary of the A.C.T., 27, Rue Victor Hugo, Tours.

#### The Spa Automobile Week.

An automobile week is to be held at Spa in August next, under the auspices of the Automobile Club de Spa. The meeting will open on August 9th with a hill-climbing contest and a mile championship race. On the 10th a touring competition is to be held; on the 11th, a balloon chase; and on the 13th an excursion to Bastogne to witness the Circuit des Ardennes race.

#### Public Services in France.

A public motor-car service has just been started between Gueux and Murzon (Marne). A company has been formed in Rouen, with a capital of £2,000 and the title La Société des Transports Automobiles de Rouen-Bois Guillaume, to establish a motor-car service between the two places.

Queen Margherita of Italy entering her "Rapid" landaulet at the Royal Palace in Rome. Messrs. Straker and MacConnell, Ltd., the British agents for the "Rapid" vehicles, inform us that Her Majesty has just placed orders for two of these cars, one of 9-11-h.p. and the other of 30-40-h.p.

and 27th next. They include three each Darracq, Panhard, Brasier, De Dietrich, Renault, Fiat, Hotchkiss, Mercedes, and Clement Bayard, a Gobron, a Vulpes, two Gregoires and four Italias.

#### A German Touring Contest.

The Hanover Automobile Club is organising a reliability contest for the 13th inst. The competitors will be divided into five classes, according to horse-power. The course to be covered is from Hanover to Luneberg and back, a distance of 156 miles.

#### Public Motor-Car Services in Germany.

A public motor-car service has just been inaugurated between Schonach and Sorberg. A company has lately been formed in Carlsbad to run motor-omnibuses in the town.

#### The Touraine Touring Competition.

The Automobile Club de Touraine of Tours is organising a touring car competition to be held from the 24th to the 26th inst. The competitors will be divided into six categories, which are on a price basis ranging from £80 to over £800. The trial will commence on the 24th inst. with a hill climbing test; on the

#### Miscellaneous Items.

The Second Annual Swiss Motor-Car and Cycle Exhibition was opened in Geneva on Saturday last.—Forty entries have, so far, been received for the motor-cycle, tri-car, and voiturette competition known as Le Tour de France, which is to be held by the Autocycle Club de France from the 12th to the 24th inst.—A competition of shock-absorbing devices is shortly to be organized by the "Auto" in conjunction with the Ligue des Chauffeurs.—The municipal authorities of Strassburg have voted a sum of £1,250 for the purchase of a steam motor fire engine.—A motor-bus service was started in Milan on the 24th ult.—The Swiss Motor-Cycle Club has just been formed in Basle.—The Berlin Municipal Authorities have voted a sum of about £15,000 to be expended by the Chief of the Fire Brigade upon experiments with motor fire-engines.—Two De Dietrichs have just been entered for the French team for the Vanderbilt Cup race.—A 10 kilometre hill-climbing competition for the Jean Homolle Cup was held by the Algerian Automobile Club on Sunday last, the event being won by M. J. Narbonne on a 20-h.p. Pilain car.

## SOME CURRENT TOPICS.

### The Austin Cars.

The works of the Austin Motor Company, Ltd., at Northfield, Birmingham, were *en fete* on Thursday last week, when the directors gave a lunch to celebrate the completion of their first car. The Clerk of the Weather proved anything but kind to the day's function, for when we, in company with a number of representatives of the Press, arrived at Northfield, which lies about eight miles from the great Midland industrial centre, it was to find the whole countryside covered with snow to the extent of over two inches. The works being located some distance from the station, the Austin Co. had thoughtfully provided a fleet of cars to convey their guests to the factory, where they were received by Capt. Kayser, Mr. H. Austin and Mr. Harvey

albeit competitors of the Austin Company, among them being Mr. J. Lisle, of the Star Engineering Company; Mr. F. Coleman, of the White steam cars; and Mr. Proctor, of the Daimler Motor Company, Ltd. The after-lunch speeches were commendably brief, but well to the point, and Mr. Austin, who, as will be remembered, was responsible for the design of the well-known Wolseley cars, in responding to the congratulations of the visitors on the general excellence of design and construction of the new vehicle bearing his name, spoke of the valuable aid rendered by the staff of assistants he had gathered round him; he also mentioned that his object had been to design a car having a powerful, quiet, flexible motor, a simple, strong, easily controlled change-speed gearing, reliable brakes and steering, effective cooling and lubricating systems, in fact, a thoroughly satisfactory touring car, which can at the same time be produced at a reasonable price. In connection with the latter point, however, he added that it had always been his aim, not merely to make money, but to build cars that would give satisfaction, an object which, if we may judge from a short trial run, he has fully accomplished.

A 7-h.p. Star Car ascending Spay Street, Leeds, which has a gradient of 1 in 12'47.

Du Cros, jun., the latter being the sole concessionaire for the sale of the Austin cars. A start was at once made on an inspection of the new works and of their all British product. The factory, which covers a large area, with ample room for extensions, has been furnished with an excellent equipment of the latest machine tools, and comprises not only machine and erecting shops, but also copper-smithing and body building departments. As regards the cars, two models are being made—a 15-20-h.p. with live axle drive and a 25-30-h.p. with either side chain transmission or live axle. At present attention is being principally centred on the more powerful car, of which a number were seen in various stages of construction.

### Congratulating the Designer

Subsequently the visitors sat down to an excellent lunch, served in the men's mess-room attached to the works, which had been specially decorated for the occasion, and at which we were pleased to notice several well-known members of the trade,

### Instruction Books.

Two or three weeks ago we referred in this column to the noticeable improvement which is taking place in motor manufacturing circles in regard to the publication of instruction books with the object of enabling users of modern motor-cars to get over any little difficulty which may arise. The point was once more brought to our notice one day last week by the receipt of two more books of the kind, one from the Albion Motor Car Company, Ltd., and the other from the Duryea Company. The Albion hand-book is one of the best we have so far received, it having been produced with the object of rendering it of permanent value and use. The method adopted has been to describe and illustrate each part of the vehicle in detail, the simple adjustments to be made to each part of the mechanism being carefully explained, enabling users of Albion vehicles to thoroughly understand the various parts of their cars and their relation to one another. The Albion Company are sending out a copy of the work with each of the 16-h.p. vehicles they are turning out.

## The Austin 25-30-h.p. Car.

A BRIEF reference to the new cars of the Austin Motor Company, Ltd., has already been given in these columns, but the 25-30-h.p. vehicle, the first of which is now on the road, contains so many novel features that the following description, based on an inspection of the car at the works at Northfield, Birmingham, will no doubt be of interest. Beginning with the frame, which forms the first point of novelty, this is of pressed steel construction, narrowed at the front end to increase the lock of the steering wheels. The sub-frame, which carries the motor and gear-box, is formed in one piece with the side members, which extends well to the rear, and the back portion is raised to clear the axle and allow the centre portion to be kept low for easy side entrance. A stout rod connects the two back ends of the frame and forms the support for the rear spring shackles, the usual long dumb irons being conspicuous by their absence. The brackets carrying the outer ends of the differential shaft support the forward ends of the rear springs, and it may be mentioned that the bolts through the shackles are carried at three points instead of two, as usual, to prevent deflection and undue wear. In order to provide an accurate bed for the engine and gear-box two planed steel strips, one on each side, are fixed to the lower portion of the steel shield.

The engine, shown in Fig. 2, comprises four separate cylinders of  $4\frac{1}{2}$  in. bore by 5 in. stroke, giving 32-h.p. at 900

revs., although only rated at 25-30-h.p. The exhaust and inlet valves and gear, which are interchangeable, are fitted at opposite sides of the cylinders. The crank shaft, which is forged from

nickel chrome steel, is supported on five main bearings of phosphor-bronze, the latter being fixed to the upper half of the crank case, so that the lower covers may be removed for inspection and repairs without disturbing the shaft or its bearings; not only so, but inspection covers are provided on each side to allow each of the connecting rods to be readily examined. The cams are solid on their shafts, which can be removed without disturbing any other part of the motor. The motion from the cam shaft to the valves is conveyed through levers fitted with rollers, and provision is made whereby the lift of the valves can be adjusted while the motor is working by means of nuts and set screws outside the cam shaft casing. To facilitate the starting of the engines half compression cams are brought into action by sliding the exhaust camshaft. The mixture is furnished by an automatic carburettor of the Krebs type, while the ignition is

effected by a gear-driven Simms-Bosch low-tension magneto. The rocking shafts forming the make-and-break are fitted in the inlet valve covers, and have very long bearings, operated by adjustable rods, which are moved vertically by cams on the inlet valve shaft, through the medium of levers, which can be adjusted to advance or retard the point of ignition.

Mr. H. Austin at the Wheel of the First of the New Cars.

Fig. 1.—Plan of Chassis of Austin 25-30-h.p. Car.

The movement endways of each of these levers can be separately adjusted while the motor is running, so that all four cylinders may be made to work in unison. An auxiliary ignition system is fitted, having a high-tension coil and contact maker. Both are located in a convenient position, the latter being driven by a vertical rod and bevel gearing from the rear end of the exhaust

Fig. 2.—View of Motor of Austin 25-30-h.p. Car, showing Special Joints on Exhaust Pipe.

cam shaft. The plugs for both systems are fitted in the inlet valve cover, and the advance and retard are operated by one lever on the steering wheel. The speed of the motor is controlled by a governor mounted in an accessible position on the rear end of the radiator fan spindle, which normally closes a throttle in the carburettor. An accelerator pedal fixed when depressed prevents the governor from acting, and keeps the throttle open, more or

Fig. 3.—Rear View of Chassis of Austin 25-30-h.p. Car.

less, as desired. A separate throttle operated by a lever on the steering wheel also controls the speed, and with it the motor can be slowed down to about 65 revolutions per minute, and the car will, it is claimed, owing to the correct balance and proper combustion obtained, crawl along on the top speed at less than three miles an hour.

The radiator is of the ribbed tube type, fitted in an aluminium case, the top and bottom portions of which form water tanks. The ends of the tubes fit into metal boxes having lids which can be removed for cleaning purposes. The water is circulated by means of a centrifugal pump driven by gear from one of the cam shafts. The pump draws its supply from the lower tank and forces it around the cylinders, out of which it flows through domed caps directly to the top tank of the radiator. A belt-driven fan, the spindle of which runs on ball bearings, is fitted to the rear side of the radiator, and the arms of the fly-wheel are also formed in the shape of vanes to assist in the cooling of the engine. A feature of the exhaust pipe is the provision of joints at the junctions of the different cylinder outlets to allow for expansion and contraction. An excellent view of these joints is given in Fig. 2, from which it will also be seen that the area of this pipe increases towards the rear end. A baffle plate directs the exhaust gases so that there is no tendency for them to affect the proper working of the other cylinders. The silencer, which is well supported in the frame, is fitted with a patented arrangement of exhaust outlet, which has already been illustrated in the *M.C.J.*, and which enables the driver to direct the gases to the side farthest from the foot walk, and thus avoiding a rear exit, which is so offensive to other users of the road when standing or proceeding slowly in line.

The lubrication of the motor has received special attention the inner main bearings of the crank shaft and connecting rods are lubricated by a pump positively driven, which feeds oil continuously from a recess in the crank chamber cover, into which it afterwards drains, keeping the crank chambers entirely free from splash, and preventing smoke issuing from the exhaust. The pistons and the two outer main bearings, on the other hand, are fed with oil separately by a chain-driven pressure-fed lubricator on the dashboard; the latter, as will be seen, is of the curved variety. The engine crank chamber is rigidly attached to separately-made cast steel brackets bolted to the underframe.

(To be concluded).

## THE CARE OF DISC CLUTCHES.

ARGYLL MOTORS, Ltd., who are using the Hele-Shaw metal disc clutch on most of their cars, point out that although the arrangement is designed to permit a great amount of slip without causing damage, yet it should not be abused, i.e., the clutch should not be allowed to slip unnecessarily in the ordinary course of driving, as to do so persistently causes excessive wear on the plates. Advantage may be taken of the facility of the clutch slipping when the car is running slowly through traffic or when the car is starting, but this facility should be used sparingly or the life of the plates will be shortened. Great care must be exercised as to the lubrication of the clutch, as if the plates are allowed to run dry they will seize and their surface will be destroyed. The most satisfactory lubricant has been found to be a special solution made by Messrs. J. M. Beckett and Sons, of Miles Platting, Manchester. Before putting the solution into the clutch it must be diluted with five times its own bulk of clean water: the full charge is six pints of this mixture. Two tapholes are provided in the flywheel at 90 degrees apart, and to charge the clutch one of the holes should be turned to the top, and the plugs of both removed. The solution should then be added until it just begins to run out at the other. After every 1,000 miles running the condition of the lubricant should be examined, and more solution added if it is too low. Should fresh solution not be available, and only a little be required, clean water may be added to the stock in the clutch. In the case of solution not being procurable, a lubricant consisting of equal parts of paraffin and good light machinery oil may be used until the proper solution can be obtained. Should the clutch not be acting properly it should be washed out with petrol and recharged with solution.

MR. R. SCAIFE, the consulting automobile engineer, of 20, Ogleforth, York, is also giving lessons in driving.

CONSIDERABLE extensions to their premises at 72, Great Western Road, Glasgow, are being contemplated by the Western Motor Company of that city.

MESSRS. SHARER AND YOUNG, LTD., are about to establish motor-boat works at Welliebank, Alloa.

GARAGE accommodation is now being provided at the First Avenue Hotel, High Holborn, London, W.C.

MOTOR accessories will be stocked by Messrs. Thomas Dyson, Ltd., in their new motor garage at 30 and 32, Manchester Road, Bradford.

MR. JAMES EWART, who has lately acquired the Goatfield Coach Works at Haddington, has opened them as a motor garage with accommodation for thirty cars.

MESSRS. PETER BOSWELL AND SONS, of the Borough Road, S.E., are specialising on motor-car springs, axles, wheels, iron-work, and similar fittings. They have a plant able to deal with any work of that kind, and undertake repair work of all kinds.

THE overheating of a motor-bus at Edinburgh resulted in firing the petrol tank, with the result that an explosion took place, destroying the bus, but, happily, injuring no one in the vicinity of the mishap.

AT 47, Forgate Street, Worcester, Messrs. Morgan and Co. have just opened a garage opposite the station, and adjoining the Star Hotel; they have also taken additional premises in Farrier Street, which are now in course of reconstruction.

FROM Messrs. W. H. Smith and Son come some splendid specimens of printing in colours—in proof of their ability to execute catalogues, etc., in a style likely to cause them to be read. The famous bookstall firm have broken into new fields of enterprise, and in printing for commercial firms have quickly achieved distinction. Their book of specimen types is a most effective piece of work.

MESSRS. A. W. GAMAGE, LTD., will present their shareholders with a very gratifying report at the annual general meeting on Tuesday next. The net profit has been £21,846, and the dividend proposed will make a distribution of 8 per cent. for the year on the ordinary shares. Since the motor accessories department was moved into its new quarters the increase in the turnover has been noticeable.

THE Motor Union at the present time has a Special Committee engaged in endeavouring to draft a form of agreement between seller and purchaser which will safeguard the interests of the latter without incurring a hardship on the former. Needless to say the task is one of no light difficulty. For instance, a customer wrote to the Clement Talbot Company the other day, complaining that their piston rings were rotten, as one had snapped when he endeavoured to push it on the piston. The unfortunate man had endeavoured to force open the ring as though it were made of spring steel.

THE Fire Brigade Committee of Kingston is considering the advisability of adopting a motor fire engine.

FROM the British Hele-Shaw Clutch Company, Limited, we have received an illustrated

circular clearly explaining the action and advantages of the latest form of the Hele-Shaw clutch.

MESSRS. W. D. AND D. M. TURNER are about to open a motor repair shop and garage at 104, Great Brunswick Street, Dublin. They will trade as Turner Bros.

THE Electrical and Motor Company have opened a garage at Banbury, on the main Oxford to Birmingham road. They are well able to undertake all classes of motor and tyre repairs.

MESSRS. ALEXANDER MATHER AND SON, who have a garage to accommodate eighty cars, as well as a number of private lock-ups, are opening another at Sandwich Place, Edinburgh.

THE charges for motor-cars crossing the river Mersey by the Widnes and Runcorn transporter bridge are one shilling, plus 1d. per passenger; over the Clifton Suspension Bridge the toll is 6d. for motor-cars.

MR. G. E. CARTER has opened a motor depot at 60, High Street, Grays, which will be known as the Dispatch Cycle and Motor Works.

MESSRS. ROBSON AND SONS, LTD., of Northumberland Street, Newcastle-on-Tyne, are utilising their motor-van for the removal of furniture in connection with their warehousing business.

WE hear that Mr. E. W. Glasscock, of Bishop's Stortford, is at work on the construction of a new petrol engine which works on the principle of the steam turbine. It is designed to give six explosions per revolution, and is stated to have but few working parts.

MESSRS. A. W. GAMAGE, LTD., have issued a new catalogue of "everything for the motorist," and within its ninety pages will be found illustrations and descriptions of the vast stock of motor accessories kept by this Holborn firm. It comes at an opportune time for the motorist and will doubtless find a place among the works of reference kept by him.

AT the repair works of Messrs. Panhard and Levassor, Kimberley Road, Willesden Lane, N.W., special machinery has been fitted for repairing the Eisemann type magneto, old patterns being altered and brought right up to date. The operations in this department are carried out by men specially trained in the works in France, where these magneto machines are made.

SIGNOR E. VENERI, who has been appointed director of entertainments at the new works of Argyll Motors, Ltd., at Alexandria, is a musician of considerable eminence and wide experience. A native of Reggio dell' Emilio, he served under Garibaldi in the war which established the independence of Italy. He came to England in 1882 to take up a position as bandmaster of the Royal Italian Band at Torquay, and for the last seven years he has been a member of the Scottish Orchestra, relinquishing his position in that combination to assume his new duties with the Argyll Company.

The above illustration depicts a 10-12-h.p. two-cylinder Metallurgique Car climbing the well-known Netherall Gardens with ten people up. The Car was driven half-way up, stopped for photographing, and then restarted, carrying its heavy load successfully to the top.

MESSRS. JOSEPH LUCAS, LTD., have issued a neat card giving the sizes of brackets required for head-lamps, tail-lights, commercial motors, etc. It should prove a handy sheet for reference.

MESSRS. W. AND F. THORN have lately supplied motor-car bodies to many Society motorists, a design for the Earl of Shaftesbury being a particularly noteworthy type of vehicle.

MR. G. C. DE FINNEY is undertaking to drive a 3 3-8-h.p. Rex motor-bicycle 100 miles daily over British roads for twelve months, in order to establish a record of 36,500 miles.

THE Continental Tyre and Rubber Co. have just issued a new price list of their steel armoured non-skid tyres, in the construction of which no leather is used. The studs are imbedded in the rubber tread by a special process, and instead of round discs, as before, square ones are now being employed. The surface of the tread is thus practically covered with steel, which not only makes the tyre anti-slipping but also nail proof, and eliminates punctures to the greatest possible extent.

THE Premier of New South Wales has recently had a motor-car trip through the colony. Some of the roads were extremely bad; but their successful negotiation by the car should do much to establish the automobile in Colonial favour.

FROM Messrs. Straker and MacConnell, Ltd., who are opening a showroom, at 44, Pall Mall, W., we have received a copy of their new catalogue of Rapid cars. Full particulars and illustrations are given of these Italian-built vehicles, of which four sizes—12-16-h.p., 20-30-h.p., 30-40-h.p., and 50-70-h.p.—are being made.

FROM Birmingham comes a catalogue of electrical appliances of every description for motor-cars supplied by Mr. J. C. Meredith. These include accumulators, ammeters, charging boards, interrupters, sparking plugs, switch handles, tremblers, voltmeters, etc.

THE St. Albans Rural District Council have forwarded to other local authorities in England and Wales a copy of a resolution passed by them on the subject of the dust nuisance caused by motor traffic. They urge these authorities to write to their local member and the President of the Local Government Board in similar terms.

THE statue of Richard Cobden in High Street, Camden Town, having been damaged by a motor-omnibus, while similar vehicles have knocked down an electric arc column and damaged five gas lamp columns, the Lighting Committee of the St. Pancras Borough Council are recommending the enforcement of the full claim for compensation.

AT Croydon, John Bowen, of Merstham Asylum works, was summoned for a contravention of the Motor Car (Use and Construction) Act of 1904, by, *inter alia*, having an inefficient brake to a traction engine, and for using a trailer without the weight being painted thereon; the trailer had been used for some time past without anything being said about it. The magistrates inflicted fines and costs amounting to £3 6s. 6d.

THE London depot of the Wolseley Tool and Motor Company is now located in the extensive building in York Street, Westminster, formerly known as "Niagara," and the other day we had the opportunity afforded us of a rapid run over the premises. Fronting the street is a large and well-arranged showroom, above which is a gallery from which access is had to the various offices, while at the back is the great round building where the cars are garaged. There is a wide opening from the showroom into this building, but the ordinary entrance for cars is through a gate at the left. The building, being circular, adapts itself splendidly to car storage, each vehicle being able to get in or out without any difficulty. A wide gallery runs round the garage, capable of holding an enormous number of cars, and of such dimensions that each one can be moved independently of the others, and brought to the ground floor, by means of the lift, with the least possible delay. In addition to Niagara being the officially-appointed garage of the Motor Union, the Ladies' Automobile Club has, we understand, selected it as their headquarters for cars in the metropolitan district.

MR. B. T. WESTWELL, clerk to the Oswaldtwistle District Council, has become a motorist.

MR. E. MANVILLE is chairman of the company now being formed to introduce the petrol-electric bus into London.

THE agreement between the Motor Union and the Car and General Insurance Corporation will shortly be terminated.

AT the annual meeting of the Church Missionary Society on Tuesday, Sir John Kennaway, M.P., said that "in India the motor-car was worshipped as an incarnation of the spirit of the age."

A 30-h.p. six-cylinder Standard car was last week driven by Mr. F. E. Swann, the owner, straight from the works, Coventry, to East Finchley without a stop, and this without any previous knowledge of the vehicle in any way.

MR. JASPER PRIVETT has joined the firm of Dicks and Son, coachbuilders, 144, Clapham Road, S.W., which will in future be known as Privett, Dicks and Son. Engineering work, including motor repairs, will be introduced both at the address and at 18A, Atlantic Road, Brixton.

THE second Orphans' Day Celebration in New York will take place on June 6th. It will be organised by the New York Motor Club, and it is proposed to secure many more cars than last year, and to take several thousand orphans to a summer resort for the day and furnish them with luncheon and entertainment.

MESSRS. E. BENNETT AND Co., 19, Sweeting Street, Liverpool, inform us that they have been appointed sole agents for the United Kingdom for the Energine Company of Cleveland, U.S.A., for their motor spirit, known as "Energine," which will shortly be placed on the English market. The advantages claimed for "Energine" over other spirits are that it will go from 40 to 80 per cent. further, gives more power, increased speed, will not carbonise, is free from acids, and that the exhaust is odourless.

MESSRS. A. W. GAMAGE are putting on the market a novelty which should be of special interest to motorists now that the touring season is about to commence. It is a map case in which maps of almost any district are mounted on rollers so that it can be fixed to the dashboard in front of the driver, who thus can easily see a clear map of the district in which he is driving, showing hills, turnings, etc. It is also made with an electric lamp, which can be connected up to the ordinary accumulators and switched on at night.

THE Bowden petrol filter is one of those small fittings on a motor-car which have hitherto been regarded as refinements,

but which are now being recognised as necessities. By the exercise of care it is possible to avoid cloggings in the carburettor without using such a thing as a petrol filter, but experience has shown that it is safer and handier to prevent trouble by means of such a device. The accompanying illustration shows the Bowden filter and its parts. It is, of course, fitted to the supply pipe between the carburettor and the petrol tank. G J and K are the junction parts for the petrol tank supply pipe, K J and H those for the carburettor supply pipe. The petrol enters at the lower lever and rises in the

filter through two discs of fine wire gauze held in position between the washers C C C held in place by the lock nuts E E, the filter B simply being dropped into the body F and held down in position by the cap A. M is a drain tap, and L L a threaded plug by dismounting which the impurities in the filter can be removed.

MR. E. KENNARD, of Market Harborough, had an ingenious device attached to the wheels of his car, which greatly interested those present at the joint club meet at Ashby-de-la-Zouch on Saturday. It is an invention of Mr. Kennard's own, which automatically causes the ringing of an electric bell the moment the tyre is deflated, and thus informs the driver that something is amiss. The attachment only works when the car is running.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

### MOTOR-CARS AND DUST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In discussing this really important matter it seems to me that most of the writers on the subject take a rather too one-sided view. The wicked motor-car appears to be considered the whole cause of the nuisance. While admitting that motors are the greatest raisers of dust, yet every fair-minded observer must allow that on dusty roads horsed vehicles, especially those with more than one horse, and even bicycles,

the damage done by other people than ourselves, we should do so willingly if the result was good roads.—Yours truly,

J. BRYANT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am glad to note from your valuable journal that an eminent scientist like Mr. Carus-Wilson is considering the dust question. I fear, however, that his suggestion that the "early worm"—I had almost said "bird"—should clear the road of this nuisance for his brother worms will not prove very practical, as I am inclined to think the "early worm" will turn as soon as he finds he is first on the job.

In my opinion two tracks, some 18 in. wide and 36 in. apart, will have to be laid along the roads, of some hard material, say granite, and, where the traffic is very heavy, a double track. Then all the traffic, motors, cycles, and horse-drawn vehicles, will naturally run with their wheels on the smooth granite surface of the track, and the dust raised will be comparatively nil. The first cost would no doubt be fairly heavy, but it is possible it might prove cheapest in the end. For it is quite obvious that the country roads, as at present constructed, will not stand

A 24-h.p. Fiat Hotel Omnibus in service at Perouse, Italy.

[*La France Automobile*]

raise no inconsiderable amount of dust. Now the people really responsible for there being any dust at all are the drivers of horses and vehicles with iron tyres. Given a road once well made and nothing allowed upon it but rubber-tyred vehicles and no horses, there would never be either mud or dust worth troubling about, and yet it is calmly suggested that motor owners are to take upon themselves or to be compelled to bear the expense of abating a nuisance really caused by other people.

The suggestion of Mr. Carus-Wilson as to cleaning the roads on the "Vacuum Cleaner" system seems a good one, but I cannot see why the cost of doing this should be thrown on to the motorists only. Let them pay their fair share together with all other users of the roads and the owners of property who are all affected by the dust nuisance.

As to taxing motors more heavily, to my thinking this would be very unjust, as we are already taxed far beyond any other road users. What should really be done is to set aside the money paid in taxes by motorists, or a large proportion of it, towards repairing the roads, and if this were done it would go a great way towards keeping them in a good condition, and though we motorists should be actually paying for

the suction of the pneumatic tyre, and it is, by the way, this same suction which injures the roads that raises the dust.—Yours truly,

F. R. L. CHALK.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The inconvenience and the dangers which have been endured this Easter as a result of the manner in which our roads are made are only a foretaste of what will be suffered by the general public during the summer months. The well-being of the population, therefore, demands that very immediate and practical steps should be taken to encourage the local authorities to build the main roads of this country of dustless materials.

Unless the State takes some active steps to encourage the local authorities in the construction of dustless roads there is no doubt that very little progress will be made in this matter.

The Roads Improvement Association are approaching the President of the Local Government Board on the question. They have asked Mr. John Burns to receive a deputation, which, among other things, will urge:

1. That the Local Government Board prepare a return of the steps

that have so far been taken by Highway Authorities to construct roads of dustless materials.

2. That the Engineering Inspectors of the Board investigate these experiments and issue a report for the guidance of Local Authorities, dealing with the results so far secured and giving such guidance as may be possible as to methods of construction, degree of dustlessness secured, durability of materials, and comparative cost.

3. That the Local Authorities be encouraged to contribute towards the cost of certain experiments with dustless materials about to be made by the Association, and that the Local Government Board appoint a representative to act upon the Committee which has charge of these experiments.

4. That the Local Government Board represent to the Chancellor of the Exchequer and the Government the desirability of giving effect to the recommendation of the Royal Commission on Local Taxation (Lord Balfour's Commission)—a recommendation subsequently endorsed by the Departmental Committee on Highways appointed by the Board—that a further contribution of one million sterling should be made annually towards the cost of the maintenance of main roads, and that that grant should be accompanied by conditions calculated to secure efficient maintenance.

5. That the Board promote legislation empowering County Authorities to fix a minimum width for all trunk roads.—Yours truly,  
W. REES JEFFREYS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As I am extremely interested in the above question, and having spent the Easter holidays in Llandudno, I was greatly struck by

he saw me a quarter of a mile away and that I stopped just before I got to him. He then came up to me and asked what was the matter. I told him that the light had gone out and I had stopped to relight it. He then took my name, etc. In my evidence I drew attention to the fact that I had been summoned for driving a motor-car without a light. That my machine was not a car, but a motor-cycle with a fore-car attached. They said that that would not have any bearing on the case. Proceeding, I admitted that the light was out. As I was travelling along the road my companion called out to me that the light had just gone out. I immediately brought the machine to a standstill, got off, and was in the act of relighting the lamp when the constable stepped up and asked what was the matter. I told the magistrate that it was an accident which could not have been avoided, that it was not committed wilfully or negligently. They immediately imposed a fine of £1 and 7s. 6d. costs. I at once asked them if I was not to be allowed to bring a witness forward to give evidence in my defence. They said no, as I had admitted the offence it was not necessary, and they would not alter their decision. The publication of this may warn others to keep clear of the "justice" of the Bedford authorities.—Yours truly,

H. PROUDMAN.

### MOTORIZING IN INDIA.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been requested by those chiefly interested in the state of the motor-car industry in India to call the attention of the readers of your valuable organ to the particulars of a case that has recently been tried at the Police Court, Bombay, when Mr. C. H. Bayne, who was

Hanriot on the Darracq Car he will drive in the race for the Grand Prix de l'A.C.F. It will be noted that the change-speed lever is at the side instead of on the steering column, a new departure for the Darracq Company.

the attitude of the authorities there in connection with motoring matters generally, and the dust question in particular, as compared with that of the County Authorities in other districts. I had an opportunity of talking with several of the County Councillors in Llandudno, and they are most anxious to do everything possible to encourage motorists to visit their town, and are prepared to go to considerable expense in treating the roads in order to make them more pleasant for those travelling over them.

I am enclosing herewith a report showing how this question was treated at a meeting of the Council held last week, and I am also sending you particulars of some police court cases which prove that it is possible for one to expect fair treatment at the hands of the Llandudno magistrates. There was some difference of opinion in the case of one motorist who was summoned for exceeding the limit, as there was some question as to whether he really was travelling at a greater speed than that allowed, but the magistrate gave him the benefit of the doubt, and this in the face of evidence from three police officers.

My reason for writing to you is that it is a pleasure to find a place where one is treated fairly, and I think that we as motorists should, if possible, just show them that we appreciate this.—Yours truly,

W. M. LETTIS.

### PREJUDICE OR JUSTICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was recently summoned at Bedford for the offence of driving a motor-car without a light. The constable in giving evidence said that

charged with driving his motor-car in a rash and negligent manner, received the following extraordinary sentence:—One day's imprisonment and to pay a fine of Rs. 200, or in default to undergo 15 days' imprisonment. The magistrate further ordered that the accused's licence for the remainder of the period be suspended and declared him to be disqualified to hold the licence. Out of the fine only Rs. 50 were ordered to be paid to the complainant as compensation.

The chief points that one wishes to bring to the notice of your readers are:—(1) This was a pure accident and a first offence; (2) these prosecutions of motorists in Bombay are unfortunately coincident with the arrival of a new Police Commissioner by name Souter, a rabid anti-motorist; (3) the degradation of permitting a European to be tried and sentenced by a native judge; (4) Mr. Cursondas Chibildas is a Hindoo, with absolutely no knowledge of motor-cars, speed, or anything else connected with them; (5) the whole judgment is biased and vindictive, as is evidenced by the following:—A fine of Rs. 201 permits appeal to the High Court, so by fining the man Rs. 200 an appeal was prevented; (6) the one day's imprisonment brands the man as a convict; (7) the deprivation of a licence (for ever) seems to be illegal—it absolutely precludes a man from earning a living; (8) Government must be woefully callous of their own interests in such matters. No less than 500 cars have been imported into Bombay during the last five months, the value being £200,000. A Government duty of 5 per cent. amounts to no less than £10,000. Yet they permit a Commissioner of Police to institute all kinds of prosecutions, admittedly carried through with a view "to stop these obnoxious vehicles in Bombay."

When I was in India there was a body called the Motor Union of

Western India. Has the energy which originally characterised this body disappeared?—Yours truly,

ERNEST ESDAILE.

### THE AUTOMOBILE ASSOCIATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Many conflicting interpretations have been placed upon the decision of our special meeting at the Cordingley Exhibition. I therefore ask your indulgence to explain that although our warnings in reference to speed will for the present be extended to all drivers, there are innumerable other advantages which must and will be confined to members.

Patrols are under orders to ignore queries shouted by non-members from passing cars. This practice is objectionable and on occasions rather embarrassing. Our subscribers know how to obtain their requirements, and either the brass car badge or the membership card is their passport. Further, with our confidential bureau scheme it is possible for members (only) to drive through districts in which there are no A.A. scouts and still comply with the law of speed limit in places where the police in ambush invite its infringement.

Even as our organisation has been used unblushingly and criticised superficially by the motoring deadhead, so may we expect an avalanche of enquiries as to how all this is done. To all of which I am directed to reply that the subscription is two guineas per annum, the Automobile Association's offices are 18, Fleet Street, and the secretary is—Yours truly,

STENSON COOKE.

### THE A.C.G.B.I. EXAMINATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—You have occasionally received from me information respecting the scheme of holding examinations for the Club's driving and mechanical proficiency certificates, and I am greatly obliged for all the assistance you have given.

The basis of this movement is the establishment of a standard of proficiency by which the competent driver is distinguished from the incompetent, and the advantage to automobilism arising from the complete realisation of this object cannot be over-estimated. The examinations are, of course, conducted with the utmost impartiality, each candidate being judged entirely on his merits, and a certificate granted accordingly. I may mention, also, that no paid driver's certificate is issued to a candidate unless his character is satisfactory.

The Club, being an unbiased and independent body, can form a judgment on these matters, and therefore the Club's certificate is a guarantee of the holder's capability to properly perform his work. Examinations have been conducted throughout the provinces, Scotland and Ireland, and are frequently held in London; the fullest possible information concerning them will be readily given to enquirers.—Yours truly,

J. W. ORDE.

### ACCUMULATORS v. DRY BATTERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a 10-h.p. twin-cylinder De Dion car, and I am in trouble over my ignition. As you know, they are at present run on a dry battery. Every thousand miles or less I have to replace this for a new one, which costs me a guinea a time. What I wish you to inform me is this, can I drive the car equally as well on a 4-volt accumulator, or must I have a 6-volt, and will the latter damage the coil? I may say the car is a new one built September last, and is without fault, excepting the battery.—Yours truly,

E. A. KENT.

[Either a 4-volt or 6-volt accumulator will work the ignition satisfactorily, but our correspondent will get better results from 6 volts, and the coil will easily stand the voltage. De Dion dry batteries give 6 volts when they are new, so that the coils are made to take this voltage, but of course the dry batteries will not keep it up, and as the points of the sparking plug have been arranged with a fairly wide space between them, which the 6-volt current pressure of the battery allows, when the battery loses its strength the plug either misses, or only a very thin spark results. A well-charged accumulator always gives far more satisfactory results in the long run, and the cost of recharging is only a fraction of the cost of dry batteries.]

### SIX-CYLINDER CARS AND THE PUBLIC.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter on this subject in the *M.C.J.* of the 21st ult., your correspondent "C. A. R." might have some weight if he gave us his name. With regard to the buying public being enthusiastic about six-cylinders, I do not think there is any doubt as to this, but I question the existence of the "ring." I think, if "C. A. R." carries his mind back to the recent discussion in the various papers in connection with six-cylinder cars, he will find that Mr. S. F. Edge has done his utmost to induce manufacturers to adopt the six-cylinder principle; so well, indeed, has he succeeded, that I believe there are no less than forty-two firms now making six-cylinder cars.

What is understood by a ring? Surely it means "limitation," if anything. If inducing others to adopt your beliefs is to form a ring, then apparently Mr. Edge might be legitimately accused of being a party to it. Facts, however, seem to point the other way, Mr. Edge having been engaged for some time now in spreading the doctrine of the six-cylinder, not in limiting its development.

With regard to the six-cylinder providing excellent talking points, this is correct, as there is very little to be said for the other side in connection with high-powered cars. Anyone who has had the good fortune to ride in a six-cylinder car quickly gets past the talking point stage. He knows then the difference between the spasmodic ambles of the four and the poetry of motion of the six. As to the two extra cylinders giving more trouble, this I deny *in toto*. Surely no one who knows anything of the modern motor-car would seriously suggest that a four-cylinder car needs more repairing than a two-cylinder car, power for power. We know, in fact, that a two-cylinder car of high power destroys itself and wears itself out in half the time that a four-cylinder on equal conditions would do. The same difference is to be found, if the engine be a powerful one, between a six and a four as between a four and two. It is surely too late in the day to talk about extra cylinders bringing extra troubles; six cylinders do not complicate, they simplify.

Your correspondent also raises the question of cost. In a buyers' guide recently published in one of the automobile papers I find that here again he is in error, there being quoted in that four-cylinder cars costing more than the Napier six-cylinder, and some of the cheaper six-cylinder vehicles would come quite a long way down the list of the prices given for the four-cylinder cars, so that even the question of extra cost raised by your correspondent is not borne out in fact.—Yours truly,

L. F. BISHOP.

Motor-car has invaded Barnum and Bailey's Show. Our illustration depicts the four Gulliver Lilliputians in a miniature vehicle, overshadowed by George Auger, the 8-foot Welsh Giant.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Munckton's letter in the last issue of the *M.C.J.*, like those of most six-cylinder advocates, is off the point. I thought made it quite clear that I admitted that there were advantages in the six-cylinder, but my point is this. The price asked for the six-cylinder is out of all proportion to the increased cost in manufacture and the few advantages. The six-cylinder is being boomed in certain quarters for obvious reasons, and the "great demand" that Mr. Munckton talks about shows how easily the British public can be spoofed by clever advertising and booming. Perhaps Mr. Munckton will feel more at ease when I tell him that I am not in any way interested in a four-cylinder firm who do not manufacture a six-cylinder.—Yours truly,

C. A. R.

### ELECTRICITY OR PETROL?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As one of the pioneers of the electric carriage industry in this country, may I be allowed the privilege of availing myself of your valuable space in replying to recent correspondence in the Press on this interesting subject? BECAUSE

Because reckless statements have recently been made as to the prob-

able cost of maintaining and running an electric 'bus this is no excuse for equally reckless and unsubstantiated statements to be made regarding the upkeep of a battery of accumulators for an electric landaulet or brougham, which in his letter is put down at sixpence per mile run. The actual cost of maintaining and recharging a battery suitable for an electric brougham, where every advantage is taken of concentrated and collective management, should not exceed twopence per mile. I have run such batteries for a competing firm on very inefficient vehicles at twopence per mile and with a substantial profit.

What the actual cost of the upkeep of the petrol 'bus really is remains to be proved.

That the boom is good for the manufacturers is patent to everyone, but whether the petrol 'bus is to prove a boom to the shareholders remains to be seen.

As to the statements that hitherto all attempts to use electric accumulators even on tram lines have failed in this country, I do not know of any such attempt during the last ten years, and, considering how little the accumulator has been understood and the vast improvements made during this period in the details of their construction, I see no reason why not only should tram cars be propelled by their own batteries but that even a 'bus propelled by the same means could be run with at least as much profit as its petrol competitor, and most certainly in both cases to the greater comfort in every conceivable way of the community at large.

The way in which many of the petrol 'buses are run is, in my opinion, disgraceful, the daily increasing noise and smell will become intolerable, and I am confident that the electric 'bus will be hailed with delight by the population of this great city. That the public would hail with delight the advent of the electric 'bus goes without saying, but whether the manufacturers of the petrol 'bus would be equally enthusiastic is another story.—Yours truly,

CARL OPPERMAN.

The Marchand car which made such a fine performance in the recent Milan-San Remo light car reliability contest. Messrs. Tamagni and Raggio, who are seen seated on the car, will, we learn from the Premier Motor Co., Ltd., the British agents, pilot Marchand cars in future events of the 1906 season.

### MOTOR QUERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "W. A. B.'s" letter in the *M.C.J.* of the 14th ult., with reference to the setting of inlet valves, I beg to differ somewhat with him. Having made numerous experiments in this direction, I found that piston speed plays a great part in this matter. With an engine running at 800 revolutions per minute, I found that the inlet valve could be held open 12 mm. up the compression stroke without back pressure in the inlet pipe. The same engine running at 1,600 revolutions per minute gave back pressure when the valve was held open only 4 mm. up the stroke. Although at higher speed the acquired momentum of the mixture was much greater, there was certainly no ramming effect, this being checked by the back pressure. With reference to horse-power, this varied a few decimal points in favour of the valve being closed early, but on consumption this was found to be more economical by 10 per cent., which from my point of view is a question of great importance.—Yours truly,

H. J. TAYLOR.

### TROUBLE WITH DE DION GEAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have had great trouble lately with the expanding clutches of my 4½-h.p. De Dion voiturette. When driving they suddenly give and

lose their grip, bringing the car to a stand. After the usual adjusting they will again drive for a variable distance, seldom more than a few miles, when the same occurrence takes place. After they fail the clutch lever and expanding arm remain in their original position, so I presume the cause of the slip must be within the gear-box. This fault has previously occurred, and the gear-box was overhauled, when the pinions and bearings seemed to be in excellent condition, but the expanding arm, which is fitted with the right and left hand screw thread, seemed a little worn and was replaced by a new one. The car went well then for about 500 miles, when the events described have again occurred. The car has done about 12,000 miles. I may say that the longitudinal groove in the expanding arm is kept in place by a steel pin, which is kept in its place by a split steel band that encircles the arm. I will feel very grateful if some of your readers will kindly suggest the cause of the fault and a remedy.—Yours truly,

MEDICUS.

[We would advise "Medicus" to have new fibre fitted to his clutches in gear-box, as no doubt this is the trouble. The pinions in this type of gear being always in mesh, the greater wear comes on the clutches, and once worn to a certain degree, any amount of adjustment will not bring them in sufficiently tight to drive. The matter of new fibre is not an expensive one, and the alteration would doubtless effect a remedy.]

### A PEUGEOT QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be very grateful for information on the following point, which I think will appeal to other readers as well as myself. I have a two-cylinder 7-h.p. Peugeot, a reliable, useful little runabout for station work, etc., the hind wheels of which have lately taken to spreading, in spite of the extremely light body containing two seats. I conclude it is the wear in the differential gear-box, which is placed about a foot from the left hind wheel—in fact, the axle shows signs of a slight opening there.

I should like to know if there is any danger in this. At two motor shops they advised me to have a new axle, box, etc., complete, evidently scenting a job, but if it is merely rather unsightly, I would wait till I gave the car a general refit. Hoping you will kindly give me the benefit of your valuable experience in this.—Yours truly,

SAILOR MAN.

### AN OBJECTIONABLE DEVICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I venture to heartily support the remarks made by "Twenty-miles-an-Hour" in the last issue of the *M.C.J.* An exhaust cut-out on a modern high-powered touring car can from all points of view only be regarded as an instrument of public torture, and I for one hope that the day of this particularly pestilent and really inexcusable device will soon be abolished. The matter is one which might well be taken up by the authorities of the A.C.G.B.I. or the Motor Union. There are two other points which might, in my opinion, equally well receive their attention.

If the use, among traffic, of excessively dazzling and confusing lights—sometimes as many as four in number upon a single car—which give it the appearance of a battleship repelling a torpedo attack and blinding all other users of the road, could also become obsolete and be followed into desuetude by the practice of employing, in land travel, unnecessarily startling and hair-raising fog horns, the pastime of motoring would be freed from much of the ostentatious vulgarity which now too frequently characterises it.—Yours truly,

AN EIGHT-HORSE MOTORIST.

### A TREMBLER QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am the owner of an 8-h.p. De Dion. When on the road the engine frequently drags, as if something was holding it back, and then it will plunge forward, and continues to drag and plunge for a short distance, till it goes off splendidly for about a quarter of a mile or so, and then starts dragging and plunging again, and so on. The spark is not very reliable, and I think it causes the trouble by misfiring, and then picking up, and misfiring again. I have been recommended to get a trembler coil fitted, as I am told the trouble will then cease. I had the accumulator charged a few days ago, and it is correct, but the trouble arises at the sparking plug. Would any of your readers kindly give me their opinion on the matter, and state whether they think that by fitting a trembler coil and commutator the trouble will cease?—Yours truly,

R. ASHWORTH.

HIRING MOTOR WAGONETTES.—We have an inquiry from a Scotch hotel-proprietor anxious to hire a motor-car or wagonette for the summer season.

NUMBER PLATE FOUND.—Messrs. Kell and De Lotz, 38, East Street, Farnham, picked up a number plate, P. 1498, on the Guildford road on April 30th. The owner can have it on application to the firm.

## CLUBS AND ASSOCIATIONS.

### THE AERO CLUB.

THE Aero Club held the second of its meetings at the Crystal Palace on Saturday. Messrs. C. F. Pollock, V. Simons, and J. T. C. Moore Brabazon formed the ascending party. The balloon was taken in a direction directly down the Thames, and immediately a party of friends pursued the balloon in Mr. Brabazon's motor-car, followed by the Hon. C. S. Rolls with Mr. F. H. Butler. The balloon rose to a height of 2,700 feet and travelled at a rate of thirty miles an hour. Owing to the force of the wind some difficulty was experienced in finding a spot for descending, owing to many of the fields in Kent being planted with hops which had been just "poled." Mr. Pollock brought the balloon safely to the ground, however, near Stroud. On arriving at the nearest railway station the balloon party encountered Mr. Rolls, who had chased the party from the Palace.

### SOUTHERN.

THE 100 miles reliability trial of the Southern Motor Club for the Howlett challenge cup will be held on the 12th inst., starting from the Crown Hotel at Morden, then on to the Spring Hotel at Ewell, turn to the right by the Spring, keep straight on the main road till the trams are reached, then take the road on to the Angel, Thames Ditton (7½), to Esher (10), along the Fairmile Common, through Cobham, past the Hut (16), through Ripley, into Guildford, then turn (before going down the hill) down St. John Street, which is the second turning on the right past the railway bridge, leading into Guildford (25), returning exactly the same way back (50). This course is to be covered twice.

### MOTOR YACHT CLUB.

THE club house of the Motor Yacht Club will be opened on the 12th inst. Recent accessions to membership include the Bishop of Ripon, Admiral R. W. Fisher, Col. Montagu Day, and Surgeon-General R. H. Quill.

### CARDIFF.

A HILL-CLIMBING COMPETITION for motor-cycles will be held by the Cardiff Motor Club on Wednesday next. It will be confined to members of the club and take place on the Pentrych Hill, Taffs Well. Entries should reach Mr. G. W. Blackaller, the hon. secretary, 19, University Place, Cardiff, not later than Tuesday morning.

### BLACKHEATH.

THE opening run of the season took place on Saturday last, to The Beacon, Westerham Hill, Kent, where, although the afternoon proved somewhat inclement and cold, about thirty members and friends sat down to tea. Amongst those present were Messrs. F. Beadle (Ford), H. Beadle (Rover), Leonard Beadle (Regal), W. F. Butcher (Clement-Talbot), H. A. Cunis (Krupcar), Dr. J. S. Goodall (Horley), Professor Carlton J. Lambert, vice-president (Argyll), T. Marshall (De Dion), H. J. Reeves (Quadrant), J. H. Reeves (New Orleans), and E. W. Stabl-Johnson (Star). The next meet will take place on the 19th inst., at the Railway Hotel, Westerham.

### IRISH.

QUITE a large number of members of the Irish Automobile Club were in attendance on Monday when his Excellency the Earl of Aberdeen, Lord Lieutenant of Ireland, formally declared the new premises open. His Excellency was received on his arrival by the chairman, Sir W. G. D. Goff, Bart., Messrs. Thomas Talbot Power, vice-chairman, W. Leybon, hon. treasurer, E. White, hon. secretary, and Chaytor, secretary. The following members were also present:—The Earl of Drogheda, Messrs. T. L. Plunkett, Hum Bland, T. H. Hall, Dr. Smith, J. N. Hone, R. J. Meccredy, Colonel Thomas, L. J. O'Higgins, J. B. Dunlop, A. Montgomery, H. Malley, G. P. A. Colley, J. M. Davies, W. H. Kingsbury, J. B. Dunlop, jun., W. C. Wisdom Hely, H. S. Close, J. C. Percy, J. G. St. George, W. L. Hayes, and F. W. Perry. Letters of apology being received from the Lord Mayor of Dublin and from Sir Horace Plunkett, K.C.V.O., president of the club, who were unable to attend.

### YORKSHIRE.

THE Yorkshire Automobile Club had their first club meet on Saturday, when some 130 members visited Harrogate, those present including Messrs. Wm. Armitage, W. Ashford, S. Broadbent, Guy Barrett, W. Bartholomew, C. H. Cooper, K. M. Chadwick, C. B. Crawshaw, A. W. Dougill, T. W. Gaunt, C. F. Guest, J. Harrison, H. T. Hirst, L. Hey, A. Kirk, E. Gordon Learoyd, Y. A. B. Lockley, H. O. Leather, A. W. Macleod, J. H. Pickford, W. Robertshaw, S. Russell, R. Steele, G. Scholey Smith, P. A. Stainer, H. Tomlinson, A. Towler, W. Tempest, J. W. Watson, Dr. J. Crossley Wright, A. L. Whitehead,

H. Wyles, and, S. W. Wilkinson. A very enjoyable afternoon was spent, and the chairman, Mr. E. H. Hepper, and Mrs. Hepper entertained the members and friends to afternoon tea at the Hotel Majestic.

The following gentlemen have been elected to membership of the club:—Messrs. S. MacFarlane, Leeds, F. Roper, Leeds, W. H. Hanson, Barnsley, Sidney Girling, London. It was also decided to join the Manchester Automobile Club in an inter-club meet at the Empire Hotel, Buxton, on 23rd June.

### AUTO CYCLE.

WITH Mr. B. Chatterton in the chair, J. W. G. Brooker gave a paper on lubrication to this club on Thursday of last week. Those who participated in the discussion included Messrs. J. Veitch Wilson (Price's Patent Candle Company, Ltd.), Albert E. Newton (Vacuum Oil Company, Ltd.), Wm. Scott Taggart (the Henry Wells Oil Company), Dr. Seward, Lieut. Windham, Van Heeydenk, and M. de Prele (London Road Car Company).

Touring in Savoy. The Cascade de la Serraz, near Chambéry.

### WOLVERHAMPTON.

ON the 26th inst. the Wolverhampton and District A.C. will hold an excursion to Hereford, when petrol consumption trials will take place. On the 4th prox. there will be an inter-club run with the Nottingham Club. Hill climbing competitions, a picnic and reliability trials are also included in the programme of the season.

### THE MOTOR VAN, WAGON AND OMNIBUS USERS' ASSOCIATION.

THE following circular with reference to the condition of the roads in London has been addressed by the Motor Van, Wagon and Omnibus Users' Association to the companies operating motor vehicles:—

"The Motor Van, Wagon and Omnibus Users' Association has under consideration what steps can be usefully taken in the interests of the companies operating motor-omnibuses to bring pressure to bear on various Borough Councils in the matter of road surfaces in London. The excessive wear and tear caused by the condition of disrepair into which they are permitted to fall, and the slow and leisurely way in which repairs are made, involve a very heavy burden upon the traffic using the highway.

"They are therefore asking:—1. What action your company taken in the way of approaching Local Authorities in the mat

2. What roads in London do you find are usually abnormally bad.
3. The number of breakages that your vehicles have suffered, and which you attribute to the irregularity of the paving.

"The committee are also considering at the same time the question of central standards and refuges, and in this connection will be glad to have the experiences of companies, and what statistics of accidents caused by the existence of central standards are in the possession of users of heavy vehicles."

### KENSINGTON.

A WELL-ATTENDED meeting of automobilists living in Kensington was held at the Royal Palace Hotel on Thursday of last week, when it was unanimously decided to form the Kensington Automobile Club.

A code of rules was adopted, the annual subscription was fixed at one guinea, and it was agreed that ladies should be eligible for membership.

A committee was elected consisting of Dr. L. C. Dobson (chairman), Drs. W. S. Cox, E. Arbould and W. H. O. Copeland, Messrs. W. H. Thompson, W. Forster, L. A. Bidwell, E. F. Philbrick, and T. C. Owen. The hon. treasurer is Mr. M. de Selincourt, and the hon. secretary is Mr. J. Horace Reeves, of 6, Penywern Road, Earl's Court, S.W., who will be pleased to answer all enquiries concerning

A feature of the recent pleasure fair at Lincoln was the Motor-car Roundabout. As will be seen from the illustration, the usual machines were replaced by realistic imitations of motor-cars. Even pneumatic tired wheels were fitted, but these have no work to do, the weight of the cars being carried on small iron wheels which run on a track.

the club. A vote of thanks to the Motor Union, responded to by Mr. Jeffreys, concluded the proceedings.

Already nearly thirty members have been enrolled, and it is clear that there is room for a club with a modest subscription in the West End of London.

### A JOINT MEET.

IN weather more in keeping with December than the end of April, a large company of automobilists assembled at Ashby-de-la-Zouch on Saturday, the occasion being a joint meeting of the members of the Nottinghamshire, Derbyshire, Leicestershire, Northants, and Midland Clubs. Amongst others present were Messrs. F. A. Bolton, F. A. Smith, Booth Granger (hon. secretary), J. W. Carson, H. Bircumshaw, H. Belcher, W. D. Wells, H. H. Bowden, M. Ross Browne, E. W. Lewis, P. L. Huskinson, S. Clifford, and H. C. Wright, of the Notts Club, Mr. Kennard (Market Harborough), Mr. E. G. Mawbey (president), and Mr. A. M'Alpin (hon. secretary), of the Leicestershire Club; Mr. C. J. Allin (hon. secretary), and Mr. C. T. Leech (hon. secretary), of the Derbyshire Club, Mr. T. H. Ryland (hon. secretary), of the Midland Club, Mr. E. M. C. Instone, and Mr. Spencer Downing.

In all there were over seventy cars present, and many of the drivers had had a hard time of it on the road. The Nottingham members, before they reached Ashby, ran into a violent hailstorm, and when they arrived at their destination they found a thorough mid-winter scene.

### MOTOR UNION.

THE meeting of the General Committee of the Motor Union at Birmingham on Saturday, the 26th inst., will be made the occasion of an inter-club meet. The Midland Automobile Club, who are the hosts of the Union on this occasion, have determined to make the gathering a huge success, and have arranged a varied and attractive programme. On the preceding Friday members will have the opportunity of viewing works typical of the British motor industry, as the Daimler, Wolseley, and Lanchester Motor Companies have thrown open their factories to inspection. The committee meeting will be held at the Grand Hotel on the Saturday morning, to be followed by a luncheon. A gymkhana in aid of the funds of the Moseley Convalescent Hospital has been arranged to take place in the grounds of Moseley Hall in the afternoon. There are various competitions and entry forms, and full particulars can be obtained from the hon. secretary, Midland A.C., Grand Hotel, Birmingham. The combined dinner of the Motor Union and the Midland Automobile Club will be held at the Grand Hotel, and motorists from all parts of the country will be attending this important gathering.

### ESSEX.

ON Saturday the Essex Motor Club held its first open hill climb on Lippett's Hill, at High Beech, Epping Forest. The results were as follows:—

Motor Bicycle Handicap (open).—F. Hulbert, 3-h.p. Triumph, allowed 3 sec., 1; R. M. Brice, 3½-h.p. Brown, scratch, 2; H. L. Cooper, 3-h.p. Triumph, allowed 12 sec., 3; Stanley Webb, 3½-h.p. Quadrant, F. W. Applebee, 3½-h.p. Rex, and Owen Summers, 5-h.p. Vindec, won the members' prizes.

Passenger Motor-Cycle Handicap.—W. Hodgkinson, 6-h.p. J.A.P., scratch, 1; F. Cozens, 10-h.p. Lagonda, allowed 8 sec., 2; F. P. O'Reilly, 4-h.p. C.I.E., allowed 5 sec., 3. The members' prize was won by Cozens.

Car Handicap (members).—E. H. Richards, 16-24-h.p. J.P., allowed 5 sec., 1; Mrs. Price, 7-h.p. Star, allowed 25 sec., 2; Albert Brown, 20-22-h.p. Brown, scratch, 3.

### HEREFORDSHIRE.

THE following is a list of those who have either entered cars for the Frome's Hill climb on the 24th prox., or have intimated their intention of doing so:—

Entrant.	Car.	Entrant.	Car.
Adams Mfg. Co. ..	Adams Hewitt.	R. L. Jefferson ..	Rover.
Anglo-American Co. ..	Ca lillac.	P. Leech ..	Darracq.
Ariel Motor Co. ..	Ariel (2).	Legros and Knowles ..	Iris.
P. Brodtmann ..	—	Mapplebeck, Stuart Co. ..	—

C. Jarrott ..	Crossley.	—	(3).

THE Manchester and Yorkshire Automobile Club will meet at the Empire Hotel, Buxton, on the 23rd prox.

ON Saturday the North-East Lancashire A.C. held a run to Blackpool, making the Queen's Hotel their headquarters.

THE newly acquired club-house of the North East Lancashire A.C., at Kensington Place, Sudell Cross, Blackburn, is now being decorated and furnished.

THE Lanchester Rural District Council has granted permission to the North Eastern Automobile Association to hold a hill-climbing contest at Lanchester on June 16th.

### THE BRIGHTON MOTOR TRIALS.

THE expenditure which the Borough Council of Brighton had sanctioned for relaying Madeira Road in that town came under review in the case of "The King v. the Mayor, &c., of Brighton (ex parte Shoesmith)," heard before the Lord Chief Justice, Mr. Justice Ridley, and Mr. Justice Darling in the King's Bench Division on Monday, it having been challenged by Mr. Shoesmith, a ratepayer, who said it was illegal.

The technical form in which the litigation came before the Court was the argument of a rule nisi for a certiorari which had been obtained calling upon the mayor and corporation to show cause why orders for the payment of £2,500 and £500 should not be brought up into this court in order that they might be quashed. According to Mr. Shoesmith's case, in May last year Madeira Road, which was about a mile in length, was in good condition and did not need any repair at all, but, because the Automobile Club wished to hold trial speeds there, the Corporation had the existing road picked up and relaid it with a material known as tarmac. In this, it was said, they had acted improperly, as they saddled the town with unnecessary expenditure, and had deprived residents and visitors of the use of the road during repaving and during the week in which the speed trials were held. Visitors and residents,

it was said, were also deprived of the use of Madeira Terrace, the principal place in the town to which invalids resorted.

The Corporation did not deny that the immediate occasion for adopting this method of paving was the fact that the Automobile Club competition was in contemplation. The Council, it was said, acted well within their powers under the Municipal Corporations Act, which gave them the right to exercise their judgment and discretion in such a matter. The fact of having the automobile speed trials near the town, it was pointed out, would benefit ratepayers, as it would bring visitors.

After hearing the speeches of counsel, the Lord Chief Justice said the case was of considerable importance, as it involved the review of the expenditure of public money by a local authority. He came to the conclusion that the object from the beginning to the end of this expenditure was the desire of the Automobile Club to come to Brighton, and the desire of the Corporation to have the speed trials there. The fact that a public highway was temporarily closed did not weigh with him so much as the object of the expenditure, which in his opinion was illegal, and was not justified by any plea that the expense was incurred in the exercise of a proper judgment or discretion. The other judges concurred, and the rule for a writ of certiorari was made absolute, with costs. A stay for a fortnight was granted with a view to a possible appeal.

### THE LEGALITY OF WARNING.

A CASE affecting the interests of motorists was heard on Monday at Enfield Police Court. Walter Dunn, of Waltham Cross, was summoned for obstructing the police. The evidence showed that some plain clothes police officers were laying a trap for motorists. To a driver who was travelling very fast the defendant shouted, "There are police down the road. Look out," whereupon the driver pulled up.

Inspector Twist said that it was the coming profession for people to warn motorists. An association employing scouts with badges on their arms, and carrying discs to warn motorists of police traps, had been formed, and had boasted of having saved three hundred people on the Brighton and Portsmouth roads within four week-ends.

The magistrates held that such warning as the defendant gave did not constitute an offence, and the case was accordingly dismissed.

At Croydon Mr. William Farmer Little answered to an adjourned summons for an alleged obstruction of the police while timing motor-cars in London Road, Norbury, on Sunday, March 4th. The result was given in our last issue, but we may now mention that the Bench stated that they had given careful consideration to the case, but did not consider it came within 48 and 49 Vic., cap. 75. The case would therefore be dismissed.

Mr. Muskett said the matter was particularly important to the police, and the Commissioner would doubtless consider an appeal. If that was desired, he hoped the Bench would have no objection to stating a special case.

The magistrates intimated that they would offer no opposition, and the matter will now be fought out in the Divisional Courts, where the Motor Union will appear in support of the decision of the magistrates.

### POLICE TRAPS.

FROM one end of the small suspension bridge which crosses the Ripley Road at Pain's Hill a clear line of sight can be had across the fields to the Royal Oak, about half a mile distant on the London side of Cobham. A handkerchief waved from the bridge indicates the passing of a car underneath, and the policeman with a stop watch at the Royal Oak has ample time to prepare his welcome for the hapless motorist. This trap was tried for the first time a few days ago.

A CORRESPONDENT has been able to locate a trap on the road from Romsey to Winchester. It is between the first and second milestones on leaving Romsey, and situated in a dip between two hills. The police hide in or near some farm buildings, but the whole country just there affords good cover; two of them were disguised as innocent looking yokels, and they seemed somewhat sad when our correspondent ferreted them out.

A POLICE TRAP exists on the Bodmin-Truro road, nine or ten miles from the latter city.

THE police-trap between Sawbridgeworth and Bishops Stortford, on the main London-Cambridge road, is one which should be avoided, if possible. The distance is about four miles, and the cars from Cambridge are generally stopped at Sawbridgeworth for the inspection of licences. Those cars coming from London have their numbers taken, and, as the police on the watch for these are in hiding behind a hedge, care should be taken.

ON the west side of Devizes, at the bottom of the hill leading to Trowbridge and Bath, there is a measured distance of 220 yards, with constables at each end.

POLICE espionage is threatening the popularity of Bournemouth with motorists. The Christchurch police are watchful on the main entrance to or outlet from Bournemouth via the New Forest. The particular spot is known as Jumper's Corner and Iford Bridge. Another trap is in operation at the entrance to Bournemouth from East Dorset, viz., Wimborne way. The stretch of road is from Red Hill to Winton. Possibly the time is coming when the local hotel proprietors will have to call in the aid of the Automobile Association to frustrate police activity.

At Haddington Sheriff Court the first prosecutions resulting from the recently started motor "trap" near Haddington have been heard. James Cameron, motor-car driver, Edinburgh, pleaded not guilty to being the driver of a car which was going at the rate of twenty-seven miles an hour, on 14th April. Sergeant Rae gave evidence that he and Constable Veitch timed the car with ordinary—not stop—watches. They were both at one end of the mile, the mark at the other end being a house. They hid behind a bush, and timed the car to do the mile in 2 min. 10 sec. Sheriff M'Leod quite admitted that this method of timing a motor-car was just a bit rough, and in this case there was a big margin. He found the charge proven, and in considering what would have to be paid for this forbidden joy it was his duty to have regard to the practice of his colleagues in the Sheriffdom. He rather feared that until Princes Street tariff was a bit raised he would have to be content in the country in a case of this kind with the comparatively small sum of £3.

THE police have a trap in the Bolton Road, Lancaster.

THE police trap between South Charlotte Street and Frederick Street, Edinburgh, has been in active operation.

### ROAD REPORTS.

SURREY.—On the authority of Mr. Edwin Ellis, chairman of the Highways and Bridges Committee of the county of Surrey, we are able to state that the county authorities there are spending very large sums of money in experimental road material, with, so far, some sadly disappointing results.

A correspondent sends us a photograph, reproduced above, of a car returning to the Talbot works in Ladbroke Grove, W., and, whether for good or evil, two policemen shown in the photograph were evidently timing and taking the number of the car. On the other hand, one of the vigilant passengers was spilling confetti on the road to warn others of the danger which they themselves had run into. The snapshot was taken close to Wormwood Scrubs, so that the trap system is evidently drawing in on the London confines.

BURLEY-IN-WHARFEDALE.—The medical officer of health for this Yorkshire resort says that 300 yards of the main road has been treated by floating boiling tar upon its surface. An even, smooth and hard coating is given. No mud forms upon it, and after rain it is clean and firm. So far, after four months' trial, it has proved very efficient and has not been affected by the frost.

CHURCH.—At the last meeting of the Church (Lancashire) District Council it was decided to try some of the dust laying preparations now being put upon the market. Mr. Grimshaw suggested that the Council should consider the advisability of following the practice latterly adopted in Accrington of sprinkling the macadam roads with creosote oil. He had it on good authority that by sprinkling the road once a week they would to some extent allay the nuisance.

OSWESTRY.—The roads within the borough are generally considered to be in good condition. Those in the north-west district of Shropshire are on the whole very good. Mr. G. William Lacey, the Borough Surveyor of Oswestry, is about to give a trial on a portion of the main roads through the town to Akonia, for the purpose of dust prevention.

KNARESBOROUGH.—In consequence of the dust nuisance caused by motor-car traffic which passes through Killinghall, the Knareborough Rural Council has been asked to water the road through the village.

COOKHAM.—It was urged at the last meeting of the Cookham Rural District Council that the cost of motor-car licences should be

largely increased to assist in paying for the greatly advanced cost of the upkeep of roads.

**NORTHWICH.**—Some of the roads in the neighbourhood of Northwich have been treated with calcium chloride for the prevention of dust by Messrs. Brunner Mond and Co., Ltd., with good results.

### NEW COMPANIES REGISTERED.

**AMALGAMATED MOTOR-BUS COMPANY.**—Capital, £200,000. To adopt agreements with C. W. French, the London Omnibus Carriage Company, Ltd., and the British Automobile Development Company, Ltd., and to carry on the business of motor-car, omnibus, van, and cab proprietors, carriers of passengers and goods, etc.

**UPPER WHARFEDALE MOTOR-BUS COMPANY.**—Capital, £1,500. Motor-car, cab, and omnibus proprietors, carriers, etc. The first directors are Messrs. A. Pattinson and R. W. Harker (managing directors), and E. Hodgson. 5, Charles Street, Bradford.

**MERCEDES DAIMLER OMNIBUS COMPANY (COVENTRY).**—Capital, £1,000. 1, Broad Street Place, London, E.C.

**THE ST. VINCENT MOTOR AND CYCLE COMPANY.**—Capital, £20,000. To acquire and carry on the business of Mr. William M'Lean, motor and cycle manufacturer, Glasgow.

**ALLIANCE MOTOR-BUS COMPANY, LTD.**—Capital, £200,000. To carry on the business of motor-omnibus, car, cab and van manufacturers and proprietors, carriers of passengers and goods, engineers, etc., and to adopt an agreement with Motor Enterprises, Ltd. The first directors are Messrs. H. F. Clutterbuck, F. W. Kerr, the Hon. G. E. Hill-Trevor, H. W. Dawson, J. A. McCandlish, and S. K. Albright.

**TACCHI'S PATENTS, LTD.**—Capital, £100. To acquire from Mr. P. G. Tacchi the patents granted to him for improvement in motors, motor-cars, and accessories, and to carry on the business of manufacturers of and dealers in automobiles, motor-cars, cycles, carriages and vehicles, etc. Registered office, 78, Hamilton House, Bishopsgate Street Without, E.C.

**MALTBYS MOTOR WORKS AND GARAGE, LTD.**—Capital, £15,000. To take over the business of motor-car manufacturers, garage proprietors, &c., carried on by Mr. J. H. Maltby at High Street, Sandgate. Registered office, Bank Chambers, 27, Sandgate Road, Folkestone, Kent.

**TRIUMPH MOTOR COMPANY, LTD.**—Capital, £100. To carry on the business of manufacturers of motors, motor-cars, carriages, cycles and other vehicles, locomotives, engines, etc. The Triumph Engineering Company, Ltd., has also been registered with a capital of £100.

**ARMES MOTORS.**—Capital, £5,000. To establish factories and workshops for the manufacture of motors and motor machinery, etc. 115, High Holborn, W.C.

**HELIS CELL AND ACCUMULATOR COMPANY.**—Capital, £1,000. Electrical engineers and manufacturers, &c. First directors, Messrs. J. T. Szk and H. Hunt. 12, New Oxford Street, W.C.

**LONDON ELECTROBUS COMPANY.**—This company, recently registered with nominal capital £100 in £1 shares, has increased said capital to £305,000 by creation of 299,900 ordinary and 5,000 deferred shares of £1 each on April 20.

### MOTOR-CAR ACCIDENTS.

A MOTOR-CAR accident occurred on Monday morning at Markyate Street, a village between Dunstable and Luton. Mr. Charles Preston, of Lancaster, was been driven by his chauffeur, Albert Carter, when at a crossing in the main road the car ran into a horse and hay-cart, driven by a man named Horace Peddar, in the service of Mr. Timberlake, a local farmer. Horse, motor-car, and hay-cart were at once hurled in a heap. Peddar, who had both legs broken, and Mr. Preston, whose head was seriously injured, were removed to Hemel Hempstead Infirmary, where the latter has since died. The chauffeur, who, it is stated, did not see the cart, received some nasty cuts about the head, and the horse was so injured that it had to be killed. On Tuesday an inquest was held at Hemel Hempstead concerning the death of Mr. Preston. The inquiry was adjourned. The chauffeur, Albert Edward Carter, was arrested on Tuesday evening by the police on a warrant charging him with manslaughter, and taken before the magistrates at Hemel Hempstead on Wednesday.

**PRIVATE BARKER**, of the 14th Hussars, quartered at Shorncliffe, in dismounting from a motor-car before the vehicle had stopped, at Seabrook, between Hythe and Folkestone, fell. The wheel passed over his head, and he was killed.

A SERIOUS motor-cycle accident occurred on Tuesday to Mr. James Moore, of Morecambe. Mr. Moore was passing across High Bentham, and put on speed to take the steep gradient up Robin Lane. In avoiding a barrow he dashed against the stone wall of a school. He was removed to the house of a relative, and lies in a dangerous condition.

### PUBLIC MOTOR SERVICES.

ON Tuesday the G.E.R. Co. established a service of motor-omnibuses for the conveyance of passengers, light goods and parcels between Ipswich, Freston, Woolverstone, Chelmondiston, and Shotley.

**GIVING** evidence before the London County Council (Tramways and Improvements) Bill Committee of the House of Commons, Mr. Richard Tilling (managing director of T. Tilling, Ltd.), has declared that, in his opinion, the motor-bus is the vehicle of the future. Mr.

Lewis Coward, K.C., on behalf of the bus companies in London, said that from Peckham alone motor-buses crossed Westminster Bridge 488 times a day and horsed omnibuses 224 times.

### CARS ACROSS FOOTPATHS.

**GEORGE NORMAN**, George Maudsley, and Joseph Tapley were summoned at Blackpool on Monday, under the Town's Police Clauses Act, for drawing a motor-car across the footpath. It was stated that about five o'clock on Thursday of last week the defendants were seen to push a motor-car from the Promenade across the footpath into the motor garage, 8, Central Beach. Mr. Robinson, who defended, pointed out that in the section under which the case was taken it was necessary to be proved that the car had caused obstruction and annoyance or danger to residents or passengers. He contended that it had not done so. The car had been brought from the station by another car. It had no petrol and had been pushed into the shop, where it was kept for stock purposes. He contended that the case was on similar lines to those of ordinary tradesmen who had heavy goods delivered at their doors by cars, and who dragged the goods across the footpaths into the shops. The magistrates dismissed the case.

### CASES AGAINST MOTORISTS.

**JESSE BRINKLOW** was at Marylebone Police Court charged with having been drunk while in charge of a motor-car at Malden Road, Kentish Town, with recklessly driving the car, and with assaulting Police-constable Sadler. The first hearing was reported last week. In giving judgment Mr. Paul Taylor said that he was convinced that there was no intention on the part of Brinklow to injure the constable. He was satisfied, however, that there had been reckless driving, and on that charge he fined the prisoner £20 with 40s. costs or two months' imprisonment. On the charge of drunkenness he fined him 40s.

**FRANK APPLEBY**, of Walthamstow, was summoned at Stratford for driving a motor-cycle in Woodford in a manner dangerous to the public, on April 1st. Constable Sharp, 107 K, said that at 1.35 p.m. he saw defendant riding at Woodford Wells at from twenty-two to twenty-four miles an hour. He was "flying past the other traffic." At Whitehall Road several people had to run back on to the pavement, and two ladies were nearly knocked down. The witness ran into the road and put up his hand to the defendant, who pulled up in something like eighty yards. The delay in hearing this summons was occasioned by the machine being registered in Ireland. Mr. Tabrum, chairman of the bench, said, "I am afraid we must do the same as in another case, 20s. and costs. You do us poor motorists a lot of harm. If you had a spin where there were not so many people it would be different."

AT Croydon, two summonses against motorists have been heard. Mr. Staplee Firth pointed out in a case in which Anthony Hoboken, of Epsom, was the defendant, that the watch of one of the constables gave the time over the measured distance as 15 1.5 sec., the other officer's registered 16 sec., and urged that the evidence was therefore unreliable. The defendant, however, was fined £10 and costs. Hubert W. Ellis, of Chiswick, for driving at 30 miles an hour, was similarly fined.

Place.	Summoned for	Result.
Chertsey ... ..	Several cases of exceeding legal limit	£3, etc.
Kingstown ... ..	No light	1s., etc.
Leicester ... ..	Dangerous driving	£5, etc.
Bingham ... ..	No rear light on motor lorry	Dismissed.
Henley-in-Arden ...	Dangerous speed	£5.
Coleshill ... ..	Reckless driving	Dismissed.
Aberdeen ... ..	No identification mark	£3.
Mortlake ... ..	Exceeding regulation speed	£3, etc.
South West London	Exceeding legal limit	£2, etc.
Lancaster ... ..	Several cases of furious driving	£3 to £10 each.
Southampton ...	Five cases of exceeding the legal limit	£3 to £4 each.

THE King of Spain travelled to London from Southampton on Tuesday on a Daimler car.

**MESSRS. WARD AND GOLDSTONE**, of Strangeways, Manchester, have sent us a circular giving particulars and illustrations of the various motor-car ignition specialities they have placed on the market. These include charging dynamos and adaptors, accumulators, voltmeters, electric tail lamps, etc.

**MESSRS. LEGROS AND KNOWLES, LTD.**, have just completed an Iris 24-h.p. car, with shooting brake body, for Mr. A. F. Bassett, of Camborne, Cornwall. The vehicle is very wide and roomy, with seating capacity for eight people in the back and two on the front seat. The brake is also capable of carrying up to 30 cwt. of luggage when required, and the seats are completely removable for this purpose.

# THE Motor-Car Journal.

VOL. VIII.]

LONDON, SATURDAY, MAY 12, 1906.

[No. 375.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

THE Royal Commission on the Motor Car Acts, presided over by Viscount Selby, has practically completed the taking of evidence, and is now engaged in the consideration of its report, which, however, is unlikely to be ready for publication until after Whitsuntide. The report will deal not only with the working of the Motor Car Acts in this country and the regulations made under them, as well as with the injury to the roads alleged to be caused by motor-cars, but will also comprise a review of the law and practice in the principal foreign countries in relation to motor-cars. Recommendations as to what charges should be imposed in this country in respect of motor-cars and how any money thus raised should be applied are also expected to be made by the Commission, but the likelihood of legislation based on the report being adopted this year is as remote as ever.

### Novel Ballooning.

THOSE intrepid balloonists, Messrs. F. H. Butler and Pollock, on Tuesday made a somewhat novel ascent in the balloon "Dolce far Niente." Starting late at night, they arrived over the Devil's Dyke, near Brighton, where they decided to anchor till the morning. The night was a moonlight one, and from the dizzy height the scene below was grand. In the early morning the notes of the cuckoo were heard, and the songs of the nightingale and other birds afforded a concert which was indeed as unique as it was enjoyable. The party came down at Brighton next morning, and Mr. Pollock with the balloon on board returned to town by the 8.45 a.m. train.

1 in 170.

AFTER all, motorists are not of so dark a hue as some of the magistrates and provincial motorists would have us believe. Police-sergeant Waghorn, who is a profitable officer to the Haywards Heath authorities, grew quite confidential in the local police-court on Monday, and told the magistrates that at Slaugham 170 cars were timed on Easter Monday, and only one was stopped. During three days the police there timed more than 400 cars, and found that only eleven were exceeding the limit of police prosecution. All this is satisfactory to those who escape, but those who fall victims have to pay fairly heavily for the experience.

### The Traders' Mark.

THE letter with regard to the use of the general identification mark published on another page suggests some points to which traders should give heed before the future legislation with regard to the automobile becomes the subject of debate in Parliament. Let it be premised that the object of numbering vehicles is simply to provide a ready means of identification should the owner or driver be subsequently wanted. Then we would urge that a general mark, associating all the vehicles stocked for purposes of sale or used by way of

trade, should be given each trader in order to distinguish his vehicles in case of misdemeanours by any of the drivers. The record which he has to keep will then enable anyone to single out the driver of any particular car. Such a simple rule would obviate all the legal quibbling that has been associated with the definition of "cars on trial," "intending purchaser," and similar terms very interesting as intellectual exercises for the legal profession, but extremely expensive for the ordinary commonsense person. Uniformity with regard to the charge to be imposed for such marks is also desirable, and the tax might be brought down to the lowest possible limit. Small firms in rural districts having only one car in their possession are charged similar terms to those which are enforced on houses owning a score of vehicles. If such is to be the rule, one universal fee of a guinea instead of the three pound maximum should be advocated. Hitherto it seems to have been taken for granted that the object of such charges was to replenish local funds, which last year benefited to the extent of £61,967 from ordinary registration and licensing fees. Legislators should be content with simplifying such matters on lines of strict economy, in order to encourage, and not to retard, an advancing industry.

### Instructions to Drivers.

SOME directions which the New Arrol-Johnston Car Co., Ltd., have just issued to their drivers, and to all who may be in charge of cars, appear so excellent that they may be given the wider publicity of our columns with advantage to the whole automobile movement. According to these, no corner should be rounded at more than six to eight miles per hour, and in narrow streets or where traffic is heavy this speed should be reduced to walking pace. When pedestrians crossing the road show undue fear or panic the car should be pulled up immediately. Though drivers of horses may be in the wrong, pull up and show them every consideration, even to leading the horse past the car if necessary. Now and again the pace of the car should be compared with that of the horse-drawn vehicles travelling in the same direction. Cyclists and other forms of traffic should be given as much room as possible, and adequate care exercised when passing a tramcar. If professional drivers, as well as those who use their own cars, would pay regard to such suggestions as these, local prejudices would be readily dispelled.

### On the Footpath.

TROUBLE is brewing at Blackpool in connection with the right of motor garage proprietors to use the path in front of their premises for the passage of cars from the roadway to the shop. Last week we recorded a case in which the Chief Constable was worsted; now the matter has been revived in another instance raised in the police court on Monday. It appears that last month Motors, Ltd., Blackpool, applied to the Corporation for permission to make a crossing opposite their garage on Central Beach. Later they were informed by the borough surveyor that the application had been refused. Acting upon advice, Henry Culpan, one of the company's representatives, drove a motor-car over the footpath twice, and when told by the police he would be reported he replied that he had not caused

any obstruction. The Chief Constable on Monday stated that the prosecution was under the Blackpool Improvement Act, 1893, under which he need not prove obstruction. For the defence, Mr. Roland Robinson said that the Act under which the information was laid was subject to the law of the land. The owners of the garage really owned the land to the centre of the carriage way. After a long retirement by the Bench the chairman announced that they would have to dismiss the summons, but would state a case to ensure a settlement later. It was a great hardship that the application of Motors, Ltd., had not been dealt with by the Corporation. This raises an important point of more than local concern.

#### Encouragement Necessary.

If the town councils and other administrative bodies are prepared to accept the payment of rates by traders and generally to regard them as desirable persons, they should facilitate rather than retard the business of the individual firms. It does not need much knowledge of the ways of the world to see that if a motor garage becomes a financial success it is to the advantage of the Corporation in every way. There-

King Alfonso and Princess Ena on a 40-h.p. Daimler.

During His Majesty's visit to Osborne no less than five Daimler cars were placed at his disposal, and the whole of the time he was in England the cars ran with very great consistency, His Majesty expressing his appreciation of these British-built vehicles.

ore a far-seeing authority would go to the extent of providing crossings on the pavement to firms whose location is likely to be permanent, and we would suggest to the Blackpool people that such an expenditure would be more profitable to the town than raising issues in the police-court, which only place their governing council in a parochial light before the public.

#### In Ceylon.

FROM a correspondent in Ceylon comes an interesting letter with regard to the difficulties experienced by motorists. It tends to show that the ways of officialism are much the same throughout the British Empire. In Ceylon it is said that the pariah dogs "live on pneumatic tyres and the calves of motor-cyclists." No ownership can ever be determined of a dog that brings a motorist to grief, but, should the beauty of the mongrel be spoiled by a passing car, half a dozen, or more, owners of the valuable "hunting" animal come forward claiming compensation. Hence the proposal that motorists there are making to the effect that dogs should be registered, and that no

actions should be allowable with regard to animals of an unregistered category. The hint may also be conveyed to motorists here to always demand to see the licence for any dog for which claims may be made. Such a precaution may save trouble; for the fear of the Inland Revenue is not yet wholly lost, even in respect to dog licences.

#### The Careless Chinese.

ACCORDING to an American lady who resides in China, the chauffeur question is the great difficulty with regard to the progress of automobilism in that country. The roads in and around Shanghai, she says, are excellent, with no speed limit outside the city, while inside the city a speed of thirty miles an hour is virtually permitted. There are a good many motor-cars in Shanghai, but very few arrests have taken place. In case of trouble the police take the name of the owner and the number of the car, and unless someone is killed or badly injured prosecution seldom follows. Most of the motorists employ French or Chinese chauffeurs, but the latter are very unsatisfactory, although they readily grasp the mechanical part of their work. The majority, however, are very careless.

#### Markyate.

MARKYATE has a gloomy sound to motorists, having been associated with two accidents, both of which have been attended with fatal results. The illustration on page 238 depicts the road on which Mr. C. W. Preston lost his life in the accident reported in our columns last week. There are danger signals on each side of the crossing, about 50 yards away. One of these can be clearly seen in the photograph.

#### A Dust Tax.

WE do not follow the reasoning of Sir John Hibbert, the Chairman of the Lancashire County Council, who at the last meeting of that body advocated that owners of motor-cars should be taxed with a view to supplying local authorities with the wherewithal to abate the dust nuisance. This seems a very unfair proposal, for it is clearly the duty of the Councils to provide proper highways for public traffic. They neglect their work and then grumble because motorists draw attention to the matter by heaping clouds of dust upon their heads. Surely this is scarcely right. Rather would we see the authorities that have made so much profit out of registration and licensing fees utilise that money to put their roads in order. Fortunately the Lancashire Council did not give great heed to the proposal of its chairman, and has had the good sense to allocate £500 to be spent on experiments towards allaying the dust nuisance.

#### The Motor-Omnibus in London.

AT the next meeting of the Wandsworth Borough Council a report will be received from the Highways Committee on the subject of the noise caused by motor-omnibuses. In reply to a letter from the Council in this connection, the Commissioner of Police wrote that he had directed special attention to certain points affecting the construction of motor-omnibuses, and had issued regulations which he trusted would have the effect of mitigating the undoubted nuisance caused by some of these vehicles. The whole industry was at present in an experimental stage, and he was satisfied that manufacturers and proprietors were seeking for a tyre which would be free from the defects at present noticeable; that on this account, to avoid hampering unduly a young and important industry, it was essential that the police should interfere with circumspection while endeavouring to ensure that there shall be no unnecessary annoyance. The committee recommend that the Commissioner be thanked for his letter, and that his attention be called to the annoyance caused by motor-omnibuses using the side roads in Putney upon the termination of their journeys, and that he be asked to take steps with the view of preventing the cause for complaint.

**The Motor-car and the Circus.**

So many revivals of languishing industries have been made possible by the favour with which the automobile is now regarded, that some are in danger of being overlooked. We had never associated the future of the circus as having been brightened by the coming of the car, although one firm of steam roundabout constructors has gone into the heavy vehicle business as a relief from the growing tedium of the old-time pleasures. Mr. Fred Ginnett, whose name is redolent of the tent and the ring, has assured the ubiquitous interviewer that the motor will save the circus from the starvation with which it is threatened. Cheap railway trips and the popularity of the variety theatre have been adverse factors in the later career of the circus manager. But the motor-car now suggests such economies in organisation that Mr. Ginnett has become optimistic with regard to the future. Some of the show-carriages have required six or eight horses to convey them from town to town, and from forty to fifty animals have had to be

recently made reference, has given his Council the benefit of his views on motorism generally. He traces a three-fold influence to the "volumes of dust which in dry weather are sent up by these flying machines," and then enumerates the contamination of the air, the injury to vegetation and the "permeation of all dwellings near the roadsides." Dr. Fisher has studied the latter aspect of the matter very minutely, and waxes eloquent in his descriptive account of how the dust operates, as an excerpt or two will show: "The house stands on the roadside with its door and windows open to admit the fresh air in hot weather. In come volumes of dust on to the clothing and food, and on to the beds on which the occupants of the house have to sleep. I shall not be surprised if time shows that the nervous system will suffer by the excessive and prolonged use of automobiles, quite apart from the risks of inhaling contaminated dust. The driver must be at attention, his nervous system is on full tension. Are we not, even in rural districts, living at a more rapid rate? Is not the whole tendency of life to overtax the powers which are given to us, both mentally and physically?"

The Churchill 24-30-h.p. Char-a-banc, which attracted considerable attention at the Cordingley Show, has now been delivered by the builders, Messrs. Durham, Churchill and Co., to its owner, Mr. Thomas Lee, of Girvan, Ireland, who intends to run it in connection with his Girvan, Ballantrae and Colmonell coaching tours. The vehicle, which is fitted with a 24-30-h.p. Aster engine and a "Champion" friction clutch and change-speed gear, was recently submitted to a trial trip from Portrush via Glendun and Cushendall to the stately Garraun Towers, North Ireland, where the photograph reproduced above was taken. In the hands of Mr. Churchill the Char-a-banc proved itself capable of taking all the severe gradients to be met with on the roads, Knocksaughey Hill, near Ballintoy, which is of considerable length, with a gradient of 1 in 6, being successfully mounted.

kept for haulage purposes. The distance travelled per day has always been limited, but now motor traction will lessen the expense of carting the show, while the addition of a few motor-buses to the plant of the circus will enable the proprietor to scour the villages round for larger audiences. Such is the view of the up-to-date showman.

**The "Deviation of Nature."**

DUST and Medical Officers of Health seem the most potent assets of the anti-motoring fraternity just now. The official who watches over the health of the people of Glastonbury, in Somerset, attributes the prevalence of influenza and other diseases that attack the respiratory organs to the clouds of germ-laden dust raised by automobiles passing through the town. Similarly, the Medical Officer of Health for Garstang, Lancashire, to whose fulminations against the motor-car we

Such, then, is the combustion of the human machine that we become predisposed to the ingress of disease. Nature is deviated from her true path, and in these days of rapid progress all around us we may have long to wait for the time when man or woman may die a natural death, and disease in its highest sense does not exist."

**Motor Fishing-Boats.**

A REMARKABLE feature in the Icelandic fishing industry of the last two years, according to the British Consul at Reykjavik, is the introduction of motor-boats for the coasting fisheries. During last year the number of these boats has greatly increased, some of them being built in Iceland itself, besides a good many being bought from Denmark. Most of these boats are open, but some people buy them decked, which will be necessary if they are to be used for the deep-sea fisheries.

The experience hitherto obtained from the motor-boats is fairly satisfactory, as far as fisheries are concerned, several of them having got a fairly good catch. At Seydisfjord and Reykjavik insurance for motor-boats has been established, which is highly necessary.

#### In Praise of Tring.

THIRTY-ONE miles from London, and standing 450 feet above the sea level, on a slope of the Chiltern Hills, is the town of Tring, delightfully surrounded with fine contrasts of hill and wooded scenery. It is a country of palatial residences. Within easy motoring distance is Tring Park, with the famous private Zoo of Lord Rothschild; Ashbridge, the seat of Earl Brownlow; Ascott, the home of Mr. Leopold de Rothschild, the motor-boat enthusiast; Mentmore, the seat of the Earl of Rosebery, and other houses of note. The district has historic associations of the Puritan days, and within visiting distance of Tring is Milton Cottage, Hampden House, and Jordans, where William Penn is buried. Within the county much is being done for the convenience of motorists, and the Hertfordshire Public-house Trust Company, Ltd., has seven establishments within its area, of which five are provided with motor garage and petrol stores. One of these is the Rose and Crown Hotel, at Tring, which stands upon the main road from London to Aylesbury and the North. The road is 100 feet wide, and access to the garage is pleasant and easy.

#### San Francisco.

FROM cable advice we were able recently to refer to the good work of the automobile in saving many lives and much valuable property during the sad happenings that have desolated San Francisco. The letters that are now coming forward add to the meagre information then available, and testify that a good deal of the rescue work would have been impossible but for its agency. Cars were commandeered by the troops and employed for their transportation from point to point in the devastated sections of the city, and when whole streets were blocked with debris, only the motor-car could be used to secure something like a prompt despatch service. A special guard of sixty soldiers was placed in charge of the stocks of petrol; and the authorities, seizing the position at a glance, practically took charge of all the automobiles that were available. The motor trade suffered severely; save a few garages located in the outlying districts, all the important stores were situated in the stricken district. The branch of the White Company was destroyed, as was that of the Pope Company, while the depot of the Goodrich Tyre Company was wiped out. The Cadillac Company were fortunate in saving twenty-one of their vehicles, which were taken over by the authorities for relief work.

#### Cost of Operation.

WHEN the Argyll depot was opened in Newman Street, W., much attention was directed to the confidence felt in that vehicle by Mr. E. H. Watson, the chairman of Argylls, London, Ltd. He offered prizes to drivers who should run any of the cars in which he was interested for 5,000 miles at a cost below what he claimed to be reasonable. Now that the first of these has been claimed, and as there are many other drivers on the point of completing the specified distance within the suggested amount, the figures given on another page will be of general interest. They give a total expenditure of £25 11s. 3d., an average of 1.181d. per mile, the petrol consumption being at the rate of 16.74 miles per gallon. When it is remembered that this 10-12-h.p. car has been employed for the conveyance of travellers, and that the greater part of the distance has been run in London, the figures seem all the more creditable—the frequent starting and stopping necessary in such service militating against phenomenal records. Mr. Watson gave £42 as the maximum amount of expenditure allowable under the scheme, and although the petrol is taken at trade rates and

the accumulators were charged from the user's own electric light installation, all must agree that the figures which appear on page 252 are a tribute to the economy as well as the reliability of the Argyll car.

#### The Scottish Trials.

THE fact that Mr. M'Donald, of the Fife Arms Hotel, Braemar, has just cut the snow on the Spittal of Glenshee Road, past the Devil's Elbow and Cairnwell summit, reminds us of the imminence of the Scottish Reliability Trials, which promise to be an even more important event than they were last year. The cars entered, a list of which has appeared in our columns as officially recognised, will have a selling price aggregating £45,000—a fact which should make an impression among the villagers, who are doubtless looking forward with zest to the second coming of the cars. Several competitors have lately been over the course of the trials, and they owe a debt of gratitude to Mr. M'Donald, whose ministry to their wants has often been a source of pleasure to Scottish motorists.

#### A.C.G.B.I. Hill Climbs.

ARRANGEMENTS are being made for a hill climb at South Harting on the same lines as last year, on Saturday, June 23rd. There will be three classes, as before, a cup and silver medal being awarded to each class, while the Club's gold medal will be given in addition for the best performance, irrespective of class, on a handicap by the Club's formula. The distance to be covered is about one mile, and vehicles will be timed from a standing start with a flying finish. South Harting is 3½ miles from Petersfield. There will also be a hill climb for the "Henry Edmunds" Hill Climbing Challenge Trophy on Saturday, July 14th, in Blackdown Park, Fernhurst, Sussex, by kind permission of Mr. F. S. Philipson-Stow, who has again kindly lent the drive for the occasion. The trophy was presented by Mr. Henry Edmunds in 1902, the details of the competition being left entirely in the hands of the Club, and the trophy always remaining on the Club premises.

LORD WOLVERTON has just acquired a 45-h.p. Mors car with limousine body.

WE are assured that there is no truth in the rumour that the General Petroleum Company, Limited, has amalgamated with the Standard Oil Company.

THE Twickenham District Council is being supplied with a 5-ton steam wagon fitted with interchangeable dust collecting and water tank body, made by the Lancashire Steam Motor Company, Ltd.

MESSRS. GEORGE POLKEY, LTD., have opened a new London office at Finsbury Pavement House, Finsbury Pavement, E.C., where Mr. John Polkey will be in charge of the firm's motor lamp department.

FOR the picture of the motor meet in Golden Gate Park, San Francisco, reproduced in our issue of the 28th ult., we were indebted to the "Auto Era," published by the Winton Motor Carriage Company.

MESSRS. A. AND A. PAYNE have removed from 172 to 72 and 74, Queen's Road, Peckham, S.E., where they have garage accommodation for 150 cars. Their body building department is in Woods Road, and the other premises being on the main road to the south coast should attract the notice of motorists going that way.

THE Chester and North Wales Motor and Garage Company, Limited, have almost completed their extensive repair shops and garage in the City Road, Chester, within a few yards of the railway station. The main repair shop has a ground floor area alone of 6,000 square feet. The Hon. Cecil T. Parker is the chairman of the company, with Mr. Philip G. Wayne, A.M. Inst. E.E., acting as managing director. Mr. Ernest W. Harding is general manager.

## THE AUSTIN 25-30-H.P. CAR.

(Concluded from Page 222.)

Dealing now with the transmission, a special effort was made in designing this portion of the car to arrange the gearing so that in supplying a chain-driven or a live axle model only the

Fig. 4.—View showing arrangement of Clutch and Brake Pedals.

rear axle and the differential gear-box, which is separate from the main gear-box, will require changing. The change-speed gear-box, wheels, brake mechanism and the operating gear remain the same in both cases. The clutch is of the multiple disc type, there being twenty-four plates, alternately steel and phosphor bronze, running in oil. The thrust of the spring is self-contained, so that no end pressure is put on either the engine or the gear-box, while a clutch buffer is provided to facilitate speed changing. A view of the gear-box, which provides four forward speeds and a reverse, is given in Fig. 6, from which it will be seen that it is provided with a central web, dividing it into two compart-

Fig. 5.—Half Sectional View of Differential Shaft. The left part of the drawing is in elevation and the right portion in plan.

ments, and enabling the two shafts to be each supported on three ball bearings, so that there may be no spring, and consequently a minimum of noise from the gears. Furthermore, the gear-box is not jointed, so that the grease cannot escape. Large inspection covers are, however, fitted, giving ample access to all the parts. The movement of the sliding gears is effected by a

single lever working in a "gate" quadrant through rods in the gear-box itself, which do not project through the ends, and as the rocking shaft moving these rods is at the top of the box no grease is able to leak out from the action of this part of the mechanism. By means of a patent form of locking gear only the one gear at a time can be engaged, the others being meanwhile positively locked.

While, on the one hand, the gear-box is brought closer to the clutch than usual, it is, on the other, separated from the differential shaft, connection being made between the two by means of a jointed shaft of special design. The differential gear is provided with an adjustment in each section which permits the bevel gears, which are provided with double thrust ball bearings, to be put in their exact position for effective and quiet working and for taking up any wear. The outer bearings of the differential shaft, as will be seen from Fig. 5, are immediately under the centre line of the sprockets, which are bolted to a dished centrepiece so as to be more readily removable. The final drive from the differential shaft to the rear road wheels is by Renold  $1\frac{1}{4}$ -in. pitch roller chains working on large chain wheels, the front pair having 34 and the rear 35 teeth. The

Fig. 6.—View of Gear Box with Cover removed. The water-cooled Foot Brake is also seen at the left.

rear chain wheels consist of rings bolted to the brake drums, and are thus readily renewable. A noteworthy feature of the radius rods is the provision of universal joints, which prevent any strain being transmitted to them.

A contracting metal-to-metal brake is fitted to the rear of gear-box, as shown in Fig. 6. The drum is water-cooled automatically when the pedal is depressed to apply the brake, and the external surface of the shoes is provided with ribs to dissipate the heat. The side lever operates through balancing gear, expanding brakes in drums formed solid with the hubs of the rear road wheels. The drums are lined with cast-iron rings, which can be easily and cheaply renewed. Strong springs release the brake shoes and hold them against stops to prevent their making any noise. The compensating gear fitted to the rear brakes is so arranged that no rods or wires are outside the frame, giving the car in this respect a clean and neat appearance.

The steering gear is of the irreversible type, with provision for taking up wear without dismantling any portion. The tube connecting the swivel arms is placed at the rear of the front axle. The back axle is of tubular construction, while the front one is forged out of one piece of steel. The steering pivots are

Photo by

The Scene of the Fatal Motor-car Accident at Markyate.

[Ashwell Morgan.]

close to the wheels, and are fitted with ball bearings to facilitate the steering. The engine and gear-box are entirely encased in by a readily removable shield. The petrol tank, which is made of copper, is fitted at the rear of the frame, and holds approximately fifteen gallons of spirit. It is of a special shape, the top being curved to follow the outline of the frame at this point. The petrol is fed to the carburettor by pressure obtained from the exhaust by means of a special device fitted with a strainer. An auxiliary hand-operated pump is fixed to the dashboard, and a large filling cap admits of a quick and clean replenishment.

Some general particulars may in conclusion be added. The wheel base of the vehicle is 9 ft. 9 in., and the track 4 ft. 7 in., the width of the frame behind the dash is 2 ft. 11½ in., and the distance from the latter to the rear cross member is 7 ft. 7 in., sufficient for a roomy side-entrance body of any design to be fitted. Finally we may mention that the weight of the chassis is approximately 18 cwt.

## THE EISEMANN HIGH-TENSION MAGNETO.

CAPTAIN THEO MASUI, the British agent for the Germain cars, has recently issued some useful hints with regard to the Eisemann high-tension magneto, from which we take the following:—"If there should be any trouble with the ignition, look to the sparking plugs and the wiring, especially the contacts. See that there is no water causing short circuit. Presuming that the magneto is clean, that the wiring is correct, that there is no short circuit or wires broken inside, and that the sparking plugs are clean and in good order, it must be the magneto itself or the coil which is out of order. To test the magneto, remove the plugs and disconnect the low-tension wire from the brush. Then, when slowly turning the engine by hand, a good spark should occur between the two platinum points. If there is no spark or a weak one it may be that the platinum points are out of order. To adjust the latter, the platinum screw should be turned by the special spanner until the distance between the points, when the hammer is on the cam, is about the thickness of a visiting card. The demagnetisation of the magnets very seldom occurs, and if the machine is found to be working well, it must be the coil which is out of order. The magneto can be easily removed by unscrewing a single butterfly nut; care should be taken, when putting it back again, to have the gears in the same position as before removal."

## USEFUL NOTES.

If doubt is felt as to the ability of the car to climb a steep hill, or the brakes to hold the car, and there is a sprag on the vehicle, it should be lowered at the foot of the hill and dragged all the way up.

A THING done right is done for ever. Whenever a motorist has occasion to remedy a fault, however slight, it should be done thoroughly. Anything less is a makeshift that may serve temporarily, but eventually will turn up once more to be done over again. The rule is absolute and certain; it can be proved by seeking to evade its requirements.

EVERY owner of a motor-car should endeavour to know his vehicle sufficiently thoroughly that he is at least capable of recognising when adjustments and repairs have been properly made, if he does not care to make them himself. It is an old truth, and will stand repeating a good many times, that a little attention before starting out will in many cases save a great deal of annoyance, if nothing more serious, on the road. Take lubrication, for example. It is not an onerous task to see that each part has its proper supply of oil, yet neglect of this precaution is responsible for a lot of unnecessary trouble. Once let a bearing or rubbing surface run dry, and it will in a very short time wear more than in a season's running under proper conditions.

WORN gear-wheels are almost insatiable in the matter of lubrication, and should be well looked after, as they are subject to considerable friction, and any wear quickly shows itself in lost motion or backlash. It is better to be a trifle over generous than too sparing, although no good can come of swamping in oil where it cannot lubricate anything.

If acetylene lamps are to be expected to give satisfactory service, the gas generators should be thoroughly cleaned every time they are filled. A good way to do this is to use a hose and water under pressure, compressing the end of the hose so as to make the water stream out forcibly. See that all the residue is thoroughly removed from the generator before refilling with carbide. The lamps are sometimes not hung properly on the brackets. The latter may be inclined forward from the vertical, causing the light to strike the road close to the car, and showing very little light ahead, or they may be inclined backward, causing the light to shine upwards, and leaving the road close to the car in comparative darkness. The remedy in both cases is obvious.

## THE TARGA FLORIO RACE.

THE first race for the trophy known as the Targa Florio, presented by the Chevalier Vincenzo Florio, was run off on the Island of Sicily on Sunday last. The contest was open to cars the chassis price of which is below 20,000 francs (£800), and the details of which corresponded in all particulars with the stock vehicles. The race was over a very winding and hilly circuit, measuring 148 kilometres, this having to be covered three times, giving an aggregate of 444 kilometres (277½ miles). The starting point was at Buonfornella, the route then lying *via* Snello, Castelbuono, Geraci, Petralia, Sottana, Castellane, and Cerdà. Nineteen entries had been received, but of these only ten put in an appearance at the weighing in on the 5th inst. The day broke with every promise of fine weather, and a large crowd of spectators gathered together as the starting hour approached. The competitors were despatched at ten minutes intervals in the following order:—

	a.m.
1. Lancia, 40-h.p. Fiat ... ..	6 0
2. Le Blon, 35-h.p. Hotchkiss ... ..	6 10
3. Cagno, 40-h.p. Itala ... ..	6 20
4. A. Fournier, 24-h.p. Clement-Bayard ... ..	6 30
5. Bablot, 50-h.p. Berliet ... ..	6 40
6. Pope, 40-h.p. Itala ... ..	6 50
7. M. Fournier, 35-h.p. Clement-Bayard ... ..	7 0
8. De Caters, 40-h.p. Itala ... ..	7 10
9. Rigal, 40-h.p. Itala ... ..	7 0
10. Graziani, 40-h.p. Itala ... ..	7 30

Practically all made good starts, the smartest to get away, however, being Cagno, Bablot, and Lancia. The departure of Le Blon attracted considerable attention by reason of the fact that Madame Le Blon was seen to be acting as *mechanicien*. Lancia was the first to finish the round; Cagno, however, ran into second position and made the fastest lap of the day, viz., 2 h. 50 min. 10 sec. A. Fournier, who was driving a Clement-Bayard, collided with a bridge, and, his back axle being damaged, abandoned; while Pope, of the Fabry Automobile Company, London, who was making his *debut* in a big race, had to retire owing to difficulties with the petrol supply on his Itala car. In the second circuit the quickest times were made by Graziani and Rigal. Cagno, however, took only a few minutes longer and was now the leader. All the other six competitors left in the race successfully completed the second round. The third lap saw the retirement of Lancia (Fiat) and M. Fournier (Clement-Bayard). The best time was made by Cagno, who finished first at 3.52 p.m., over an hour in advance of the next man. Rigal and Bablot suffered delay in this round owing to water being poured into the petrol tanks instead of spirit. The appended table shows the result of the race:—

Driver.	Car.	1st Round.	2nd Round.	3rd Round.	Total Time.
		h. m.	h. m.	h. m.	h. m.
1 Cagno ... ..	Itala ... ..	2 50	3 17	3 25	9 32
2 Graziani ... ..	" ... ..	3 25	3 9	3 31	10 5
3 Bablot ... ..	Berliet ... ..	2 56	3 51	3 33	10 20
4 Rigal ... ..	Itala ... ..	3 7	3 12	4 6	10 25
5 De Caters ... ..	" ... ..	3 33	3 39	3 26	10 38
6 Le Blon ... ..	Hotchkiss ... ..	3 45	3 55	4 29	12 9
Lancia ... ..	Fiat ... ..	2 56	4 22	—	—
M. Fournier ... ..	Clement-Bayard	3 6	4 40	—	—
A. Fournier ... ..	" ... ..	—	—	—	—
H. Pope ... ..	Itala ... ..	—	—	—	—

Cagno's average speed works out at 29 miles per hour, Graziani's at 27½ miles, Bablot's 26·8 miles, Rigal's 26·6 miles, De Caters' 26 miles, and Le Blon's 22·8 miles. As will be seen, the race was a brilliant victory for the makers of the Itala cars, for out of the five vehicles four finished the whole distance. The one driven by Cagno is rated at 40-h.p., the dimensions of the four-cylinder engine being given as 130 mm. bore by 140 mm.

The Chevalier Florio has since announced that a sum of no less than £4,000 will be offered in prizes for the 1907 Targa Florio, £1,600 going to the winner, £400 to the second, £200 to the third, £120 to the fourth, £80 to the fifth, and £40 to the sixth. £1,200 will be awarded to the firm whose team of three cars makes the fastest collective time, while £360 will be set aside for prizes for those who make the fastest time in each lap.

## CONTINENTAL NOTES.

## The Elastic Wheel Competition.

Seeing that only three competitors in the elastic wheel competition in France managed to survive the ordeal, the task of the jury in awarding the prizes was an easy one. Each one received a first prize and all three hold the Chantemerle Challenge Cup for a year. The Soleil and the Garchey wheels both derive their elasticity from rubber rings fixed in the hubs, forming a sort of buffer between the latter and the rim. In the Garchey arrangement the diameter of the rubber ring is about 6 in. across, and from 1 to 2 in. thick. Its circumference bears a wide flange, by which it is held to the wheel proper. In addition to the ring, three rubber roller bearings are placed at equal distance near the circumference of the wheel, which take up the more violent shocks. The Soleil wheel has two concentric steel hubs, the smaller one, which receives the axle, being the hub proper, and the other assembling the spokes. The two are united by the elastic portion of the wheel, a large collar of solid rubber, in which the bolts are embedded. In the Edmond Levy wheel the elasticity is obtained by means of

An Automobile Wedding.

An interesting automobile wedding took place at the Church of St. Michael and All Angels, Hellenburgh, N.B., last week. The bridegroom was Mr. Charles F. Green, son of the late Mr. Phillip Green, Judge of the Supreme Court of India, and the bride Miss Winifred M. Smith, daughter of Mr. W. Alexander Smith, of Taybank, Chairman of Argyll Motors, Ltd. The bride, the bridegroom, and most of the guests drove to the church in motor-cars, and the long line of Argyll landaulets, limousines and open cars, stretching from the church door right down to the Sea Front, attracted much attention.

two rubber circles, one at each side, lodged in a groove between the inner and the outer rim, and held in position and protected by a face plate. All three wheels are shod with solid rubber tyres.

## Touring in France.

Motor touring in France is now in full swing, and, judging from present appearances, a much larger number of British and American motorists are preparing for a spin over the grand French roads during the current year than ever before. Avignon seems just now to be a favourite rendezvous, for among those who visited the old town on a recent Sunday were the Duke and Duchess of Westminster, on a 90-h.p. Mercedes; Field Marshal Sir George White, the hero of Ladysmith, and Lady White, on a 40-h.p. Bollee; Prince and Princess Mohamed Ibrahim, on a 40-h.p. Mercedes; Count Vladimir Skerzewski, on a 24-h.p. Mors; and Countess Arnoldi, on a 35-h.p. Rochet-Schneider.

### The Forezien Touring Competition.

A touring competition organised by the Automobile Club Forezien, of St. Etienne, was held last week. The actual competitors, who numbered seventeen, were divided into several categories, based on the bore of the cylinders. The first day's run was from St. Etienne to Avignon. Fourteen cars safely completed the journey, but the day was not without incident, for the vehicle carrying the officials broke down, and there was no one to time the competitors into Avignon. A 70-h.p. Rochet-Schneider driven by Vitalis also caught fire and was seriously damaged. The return to St. Etienne was made on the following day over another route. The first place in the section for cars having four cylinders of a bore of 120 mm. was taken by a 24-h.p. Berliet driven by M. Plattier. In the section for engines of 110 mm. cylinder bore an 18-h.p. Mieuisset piloted by M. Riviere secured the premier position. M. Paret (16-h.p. Berliet) was the winner of the section for motors of 100 mm. bore, and M. Dubost, on a 14-h.p. Clement-Bayard, of the 90 mm. bore category.

### A Belgian Touring Competition.

Under the patronage of the Belgian, Spa and Liege Automobile Clubs the newspaper "La Meuse" is organising a touring

named. Orders have been placed for three Serpollet twenty-seated 'buses, which are expected to be put in operation by July 1st next.

### Police Activity near Paris.

Saint Germain-en-Laye and Sevres, near Paris, should at present be given a wide berth by motorists as the police have of lately been unduly active. At the police court at Sevres, the other day, no less than seventy-three summonses for furious driving were dealt with.

### A German Motor Body Building School.

The Technical Institute in Aschaffenberg, which already comprises a school for chauffeurs, has decided to shortly add a department for automobile body construction. The object is to familiarise practical carriage builders with the requirements in the construction of bodies for motor-cars.

### Public Services in Italy.

Public motor-car services are rapidly increasing in number in Italy, especially in the vicinity of small towns in mountainous localities where the passenger and goods traffic is insufficient to justify the installation of an electric tramway. There are already several lines which exceed 100 kilometres in length,

The Nottinghamshire Club's Speed Trials at Clipstone. (See page 250.)

competition for the 4th June next. The competitors will be classified on an average speed basis ranging from 20-25 kilometres to over 40 kilometres per hour. The course to be covered, which measures 128 kilometres, starts and finishes at Spa, and takes in Vielsalm, Aywaille, Lonveigné and Malchamps. Several steep hills are included in the route.

### The Race for the Grand Prix de l'A.C.F.

With the view of freeing the Sarthe circuit from neutralisations and dangerous crossings, several slight changes have been made in the course, and last week the Sarthe Automobile Club had the modified route carefully measured. The distance works out at 103.18 kilometres, or approximately 64½ miles. This has to be covered altogether twelve times by the competitors, six on each of the two days.

### Public Services in Switzerland.

La Société des Transports Automobiles de Geneve à Annecy is the name of a company which has just been formed in Geneva to inaugurate a public motor-car service between the two places

which have been in operation for some time and have given satisfactory results. The services usually comprise a number of vehicles capable of maintaining an average speed of about twelve miles per hour on average roads, carrying about twenty passengers and a certain amount of luggage. The Societa Romana Tramways-Omnibus is now making experiments with motor-omnibuses. Five different types, viz., Thornycroft, Germain, Daimler, Scheibler, and Delahaye, are being tried.

### Miscellaneous Items.

The French Automobile Club has confirmed its decision not to organise the French team for the Vanderbilt Cup race. Motor-car builders in France may, however, enter for the contest individually.—The postal authorities in Vienna are experimentally using motor-bicycles with side car attachments in the collection of the mails.—A service of motor-cabs is shortly to be started in Marseilles.—It is reported that an Itala six-cylinder car is being prepared for the 1907 season.—The men employed in the motor-car works in Turin have joined the general strike movement. A serious disturbance took place in the city on Monday.

## THE DAIMLER COMPANY.

AS was shown in the last balance-sheet of the Daimler Motor Company, success has come to one of the original English motor companies. In celebration of this it was decided to entertain those motorists who had contributed to such a result to luncheon at the Works at Coventry. This pleasant reunion took place on Wednesday of last week. The assembly of motorists was unique, such a gathering of representative automobilists—trade and amateur, foreign and British—never having before been brought together in a British motor works. Recognising the common feeling of pride in their success, the directors invited many of their trade rivals, and, for the convenience of those who journeyed from London, a special train was engaged, by which most of the guests travelled.

The sight at Coventry was, to those who had known the works in the old Daimler and M.M.C. days, an astonishing one. To what had been solid floors before spacious galleries have succeeded, and the antiquated plant has given way to up-to-date machinery—a credit to Mr. Percy Martin, whose aims at

immense quantity of vehicles, the sale of foreign cars must surely become restricted in this country. The function was one which those who were present will not easily forget, and that the directors of the Daimler Company were entitled to celebrate their success amongst their friends all readily acknowledged.

Mr. Edward Manville was in the chair, and, after the usual loyal toasts had been honoured, proposed "Automobilism." The Daimler Company, he said, might well be associated with automobilism, because he thought he was right in saying the growth of motoring in this country was almost exactly contemporaneous with the first institution and progress of the Daimler Motor Company, and it followed that as the Daimler Works were originally instituted in Coventry, where these were now, Coventry might be looked upon as in this country the mother town of automobilism. As to the progress of the Daimler Company itself, it was sufficient to say that three years ago the area covered by its workshops was exactly one-fourth of what it was to-day. In three years it had increased fourfold, and, as a matter of fact, the real increase had been in the last two years. They were at the present moment engaged in extending their production, and hoped to continue to do so for some years to come. The chairman announced that the company would in the ensuing year devote special attention to increasing the foreign business in Germany, the United States, and Italy, and also that it was proposed to turn attention to commercial motor vehicles.

The Lunch in the Daimler Company's Works at Coventry.

standardisation have been fully realised. His work has been ably aided by Mr. E. M. C. Instone, the general manager, and to both of these gentlemen the directors have given a support and encouragement which has been an immense factor in transforming the fortunes of the company, until it now ranks as one of the most successful automobile organisations in the world.

The lunch, which played a prominent part in the proceedings, was served on the upper floor of the works, and was of the most *recherche* description. Showing how perfect everything was in the way of entertainment for the guests, a pocket-book was presented to each, with his name in gold, and carrying in its folds the fact that this letter-case was made from the leather with which Daimler motor carriages are upholstered. The leather is of the very best quality, and the pocket-book one which we are sure all who were present will be proud to carry and use. The system of management seemed to be of the most perfect description, and with works like those of the Daimler Company, England need not fear the supremacy of the foreigner; while with the capacity of these works for turning out an

Mr. R. A. Rotherham responded for automobilism as connected with the city of Coventry. Sir John Macdonald also responded, and gave some interesting reminiscences of the early days of automobilism in this country. With regard to the future, he strenuously urged that everyone connected with the manufacture, and particularly the manufacturers, should set their whole energies to work to secure that in the next five or ten years attention should be given to the state of our roads. What they wanted to impress upon the public was that there was a vast source of increased wealth of this country in having roads which it was not expensive to use for the purpose of commerce. Messrs. S. F. Edge and F. Coleman added their congratulations.

During the proceedings a cable was read from Atlantic City, stating that a Daimler touring car with five passengers had made a new mile record for the fully-equipped touring cars, doing the distance in 55.45 sec. Mr. Percy Martin, whose name had been mentioned by Mr. Coleman in eulogistic terms, was asked to respond, and in the course of doing so observed that the principles of manufacture illustrated in the works they were visiting were similar to those adopted in America, such as the principles of standardisation, the manufacture of quantities, and so forth, and if followed must lead to success in a greater or less degree. The work of adapting them to English practices had really been rendered easy by the valuable co-operation he had received from those surrounding him.

Mr. Rees Jeffreys proposed "The House of Commons," response being made by Mr. A. E. W. Mason, M.P. for Coventry. Col. Crompton proposed

"The Automobile Club and the Various Trade Societies, the Motor Union, the Society of Motor Manufacturers and Traders, the British Empire Motor Trades Alliance, and the Roads Improvement Association." Col. Holden replied (on behalf of the Automobile Club), Mr. Sydney Straker (for the Society of Motor Manufacturers and Traders), Mr. E. M. C. Instone, and Mr. C. Sangster, the last named for the British Empire Motor Trades Alliance. Mr. C. Vernon Pugh proposed the toast of "The Press," and on the proposition of Capt. Longridge the company also drank with musical honours the healths of the past and present chairmen of the Daimler Company, Sir Edward Jenkinson and Mr. E. Manville.

## A MOTOR FIRE ESCAPE FOR GLASGOW.

**M**OTOR-VEHICLES for fire brigade use have lately been adopted in several of the leading cities in the kingdom, but a new step in this direction has just been taken by the Corporation of Glasgow by putting into service a motor turntable fire escape. The machine, which was supplied by Messrs. Henry Simonis and Co., of Norfolk Street, London, W.C., is of the petrol-electric type, the power being furnished by a 30-h.p. four-cylinder engine, which drives a dynamo, the latter being connected up to two electric motors acting directly on the front wheels. Thus all differential gear, chains, etc., are done away with, while the danger of skidding is claimed to be considerably minimised through the machine being drawn instead of pushed. Owing to the full lock the machine, despite its length of 27 ft., is able to turn in a very small circle. The escape portion of the vehicle itself is also of noteworthy design. Hand labour is entirely done away with, the ladder being extended by means of a small carbonic gas plant. The latter is of such capacity that it can extend the ladder to a height of 85 ft. within 20 sec. Furthermore, a turntable is

provided which enables the firemen, without moving the body of the machine, to bring the escape to any desired window on either side of the street. The ladder does not require to be leaned against the building, but will, without any support except its own base, carry half a dozen firemen divided over its full length, which enables the machine to be used as what is known in Fire Brigade circles as a "water tower," the men playing with jets of water upon the building from different points of the ladder.

## A NEW MAGNETO.

**W**E illustrate herewith a new magneto which is being put on the market by Mr. T. W. Barber, of Grosvenor Mansions, Victoria Street, Westminster, and which has been specially designed as a substitute for accumulators. The machine is so arranged that it can be used in conjunction with existing contact makers and induction coils, it being connected up in the circuit just as an ordinary battery. As will be seen, the

machine consists of four duplex horse-shoe magnets, within which rotates an armature specially wound to give about-four volts, even when running slowly. The machine, which weighs complete about 21 lbs., can be located in any suitable position to enable it to be driven off the engine either by a belt or gear in the ratio of about 10 to 1. It can be easily fitted on a car, and will work with the attention only required by the lubricators; driving it at full speed when on open circuit or switched off does no harm, and it cannot be damaged by over-driving, one having been given a long test at a speed of 10,000 revolutions per minute. At slow speeds, too, as we have personally tested, the apparatus gives a good fat spark, so that it should well meet the requirements of those motorists who are anxious to adopt magneto ignition in place of accumulators.

A GARAGE with inspection pit is being constructed at the Queen's Hotel, Queenstown.

VISITORS to the east coast will find good motor-car accommodation at most of the seaside resorts. Messrs. E. Mills and Co. have a large garage near the railway booking office at Clacton-on-Sea.

A PATENT for a laminated paper tyre for motor-cars has been taken out by Dr. J. W. Carhart, of Austin, Texas, U.S.A. The paper used is a heavy binder's board, cut by means of a band saw into segments corresponding to the circle of the wheel; the tyre is built up on the rim by adding one layer or segment to another with white lead or other paint between.

"THE Motorist's Handy Pocket Guide and Note Book" is the name of a little work which has just been published by Mr. Henry King, of the "Hampshire Advertiser" Company, Ltd., Southampton, and of which a copy has been sent us. It is from the pen of Mr. H. M. Cook, of the Motor Engineering Works, Devizes, and contains in a small size a large amount of information which will be found useful and interesting by all motorists of a mechanical turn of mind. There are three main chapters—mechanical, electrical, and thermal—each dealing with different aspects of the petrol motor. Following this is a list of the different identification marks for motor-cars and a diary in which to keep a record of motoring trips.

SIR ALEX. HENDERSON, Bart., has been elected a vice-president of the Motor Union.

THE Royal Commission on Motor Cars held their thirty-third meeting on the 26th ult. There were present Lord Winchester (in the chair), Sir D. Harrel, Sir W. Forwood, Mr. Henry, Mr. Mure, Mr. Monro, and Capt. Bigham (secretary).

No less than ten Metallurgique cars have been entered for the Herkomer Touring Trophy, four of which are of 60-80-h.p.

THE Cefn (East Denbighshire) District Council has adopted a resolution in favour of a tax of £20 a year being placed on motor-cars for the benefit of local authorities.

Two whip thong makers appearing as debtors in the Southwark County Court have declared that ruin is coming upon their trade, owing to the advance of the automobile.

A NUMBER of Swift cars are already in service in Canada, and in order to increase their popularity the Swift Company had a fine exhibit of half a dozen vehicles at the Toronto Exhibition.

FROM the proprietors of Perrier, the French natural sparkling table water, comes an excellent road map of England and Wales which is quite as good as the beverage whose name it bears. It indicates both main and subsidiary roads.

MESSRS. J. J. COULBECK AND PALMER, of Royal Chambers, Kettering, held the first of their monthly motor-car auctions in that town last week. It was a great success, there being a good attendance of both the trade and private buyers, a large number of lots being disposed of.

THE funeral of the late Mr. George Thomas, of the Motor Car Garage, Waterloo Street, Swansea, was notable from the fact that, apart from the horse-drawn hearse and one mourning coach, the mourners followed in half-a-dozen motor-cars. The Welsh Automobile Club sent a wreath.

MESSRS. J. W. BROOKE AND CO., LTD., have issued a marine motor catalogue, which, in addition to illustrations and descriptions of the firm's engines, contains much information with regard to engine dimensions which will be of service to boat builders and designers desirous of arranging for the Brooke engines being fitted in their boats.

THE directors of Argylls Motors, Ltd., have resolved to declare an interim dividend on the ordinary shares of the company for the half-year ending March 31st last at the rate of 10 per cent. per annum, the said dividend to be paid on May 15th, when the dividend on the preference shares, at the rate of 6 per cent. per annum, will also be paid.

THE Cyclists' Touring Club, which some time since secured from the French, Belgian, Swiss and Italian Governments free entry for the motor and other bicycles ridden by its members, has now completed arrangements whereby the users of motor-cycles other than bicycles, viz., tricycles, quadricycles, tri-cars, etc., may enter France duty free upon production of a special triptych and the usual continental Customs ticket applicable in such cases.

WE understand that the Beaufort Motor Company, Ltd., with a nominal capital of £125,000, of which £50,000 6 per cent. preference shares (participating in the profits *pro rata* with the ordinary shares) will be offered to the public for working capital within the next few days. Beaufort cars are well known for their excellence of construction and reliability, and, independent of the home market, they are running with great success in Shanghai, New Zealand, South Africa, India, etc. Much attention is also being paid to motor-buses and industrial vehicles, large contracts for which are in hand. In view of the future demand for motor-boats of every description, the new concern is taking over Lory's Yacht Agency, Ltd., one of the oldest established businesses of its kind in the country, whose offices at 175, Piccadilly, W., will in future be run as the marine department of the Beaufort Company. Temporary works have already been secured close to London, fitted with up-to-date machinery, and negotiations are proceeding for extending the same, in view of the large business already in hand.

## HERE AND THERE.

A PROPOSAL is being made for the provision of a motor racing track at Eastbourne.

SIX G.W.R. motor-cars were requisitioned for the conveyance of members of the Household Brigade Race Club between

Maidenhead Station and Hawthorn Hill on the occasion of the point-to-point races there.

"It is quite expected that a tax will be levied on motor-cars," said the *Daily Mail* in an anticipation of the Budget.

MESSRS. H. VAN RADEN AND CO., LTD., have opened a London office at 8, Cecil Court, Charing Cross Road, W.C.

MR. W. H. STONE, of the Taunton Hiring Garage, Staple-grove Road, Taunton, has added a 10-h.p. Humber and a Rover car to his "stud."

FINES imposed on motorists in Huntingdonshire last year totalled £428, equivalent to a reduction of a halfpenny in the pound on the county rate.

OWNERS of White cars are appreciating Mr. Arthur Garratt's fine picture, "An incomparable White day in the Park," to which reference has previously been made in these columns.

SINCE his return home the Prince of Wales has obtained delivery of a new 30-h.p. Daimler fitted with a brougham body by Messrs. Hooper and Co., Ltd., and also of a new 35-h.p. Daimler limousine. Both vehicles are luxuriantly fitted, and maintain the standard of English carriage work. Messrs.

Hooper and Co. recently converted the King's Mercedes limousine into a limousine landaulet, delivery of that car, which is illustrated above, having also been made this week.

THE Bridges Committee of the London County Council has issued a small book on London bridges, giving an interesting account of their construction and maintenance.

THE Health Superintendent of Southport is to use a motor-bicycle when on his rounds of inspection. The corporation are making an allowance of £20 per annum for the upkeep of the machine.

DURING the recent visit of the King and Queen to Marseilles, De Dietrich cars were placed at their disposal. Rougier, the well-known racer, piloted the Royal car, and was presented by King Edward with a handsome souvenir.

MESSRS. LEGROS AND KNOWLES, LTD., have secured a contract to supply a motor-tower wagon for tramway purposes to the Halifax Corporation. The tower wagon will be mounted on the Iris light commercial vehicle chassis specially adapted for this purpose.

AN exceedingly graceful act was performed by the King of Spain before embarking at Southampton last week. The car which conveyed the Princess Henry of Battenberg by road from London, and also brought Her Royal Highness and Princess Ena back again to town, was a magnificent 40-h.p. Delaunay-Belleville. His Majesty inspected and was greatly interested in the car, and, to mark his appreciation of the services of G. E. West, the chauffeur who drove their Royal Highnesses, conferred on him the Spanish order of "Isabel la Catolica."

MR. W. GEO. WILLIAMS will be the general manager of the Deasy Motor Car Manufacturing Company.

A 5-TON steam wagon of the Foden type is to be supplied to the Royal Sanatorium for Consumptives at Midhurst.

THE Auckland Automobile Association have conducted a 400 miles reliability trial. It attracted thirteen entries.

MR. JOHN HARGREAVES, of Templecombe, Somerset, has, we learn, ordered a six-cylinder Hotchkiss car from the London and Parisian Motor Company, Ltd.

BOUGIE POGNON, LTD., have just brought out the simple yet ingenious sparking plug switch illustrated herewith. With one

of these devices fitted to each of the plugs of a multi-cylinder engine the sparking thereby obtained through accumulators and coil or by high-tension magneto in each cylinder can be readily tested. The illustration shows the switch in position but out of operation. To test any one cylinder the switches of all the others are closed by bringing the knobs at the top into contact with the upper metal

portion of the sparking plugs, the high-tension current then passing straight to earth, so avoiding all internal short-circuiting and consequent breaking down of coil-winding and magneto-armature, which so frequently arises through disconnecting high-tension wires from the sparking plugs when testing multi-cylinder motors.

MESSRS. ASTER, LTD., are bringing out a new 40-h.p. Aster engine fitted with low tension magneto ignition, specially designed for motor-bus propulsion.

THE "New Speedwell Motor Company, Ltd.," has been formed to absorb the present Speedwell Company. The capital will be £50,000, and the cars will be made at Chiswick, W.

THE London Motor Tyre Company, whose capacity for good work has lately been demonstrated to us, are removing their offices from New Oxford Street to the works, 9A, Newman Street, W.

THE offices of the Automobile Mutual Protection Association, Ltd., have been removed from the Strand to 109, Victoria Street, Westminster, S.W. The telephone number is now 662 Westminster.

THE Y. Z. tyre clip is a useful device for preventing the outer cover from creeping. It also enables an old cover to be used by cutting off the beads and placing the worn cover over a good one. Messrs. A. W. Gamage, Ltd., are placing it upon the market.

THE increased number of motor vehicles of various descriptions which are daily being put on the road must naturally increase the demand for petrol to an enormous extent, and during the coming Whitsuntide holidays, provided the weather compares favourably with that of Easter, there will be a similarly heavy demand on all the local supplies. In anticipation of this the Anglo-American Oil Company will arrange to have an adequate supply of their Pratt's motor spirit distributed throughout the United Kingdom.

A "NATIONAL" three-cylinder car was last week driven from London to Glasgow by Mr. Percy Lamb, of Lamb Brothers and Garnett. The first day's run, owing to stormy weather, only amounted to 100 miles, and a stay was made at Retford. The remainder of the journey—over 300 miles—was done the following day, and it is worthy of note that the car-made good averages, and the distance from Settle to Carlisle—a matter of seventy miles—was covered on two gallons of petrol. On Thursday of last week some 400 people turned out, in spite of the rain, to see the vehicle climb Balmano Brae with six passengers on board. The difficulty of the ascent was accentuated by the greasy cobble surface of the road, notwithstanding which the hill was successfully scaled, the gradient being, it is stated, 1 in 4½. The agency for the National cars in Scotland has been secured by Messrs. Robert Morton and Sons, Ltd., of Wishaw, who have just opened a depot in Bridge Street, Glasgow.

ARGYLLS, IRELAND, has been registered under the Companies Acts, the title of the company being Argylls, Ireland Ltd.

MESSRS. EDARTS have completed alterations to their motor garage at 22, Praed Street, Paddington, and also at Market Street, W.

MESSRS. HOLGATE AND CO. have a capital motor garage at the School Close Works, Neville Street, Leeds, where they also stock accessories for automobiles.

THE Directors of Aster, Limited, have resolved to pay an interim dividend at the rate of 10 per cent. per annum for the first six months of this year's trading.

ONE of the town councillors of Scarborough hopes to live to see the day when motor-cars will be abolished—probably another way of saying that he would like to live for ever.

MESSRS. HOYLES have accommodation for thirty cars in their garage at Brighouse. Mr. John Hoyles, the manager, has had an experience of automobiles extending over a decade.

MESSRS. BROWN BROS., LTD., have issued a new catalogue of their Brown cars, of which three standard sizes—22-24-h.p., 18-20-h.p., and 10-12-h.p.—are being made for the present season.

PALMER cord tyres are fitted to the delivery vans used for the business of the "Newcastle Chronicle." They have been in use for about eleven months, and are doing an average of 30 miles per day.

THE premises which, as mentioned last week, have been taken at Glasgow by Messrs. Robert Morton and Sons, Ltd., were recently occupied by the Caledonian Railway as their Bridge Street Station.

MESSRS. T. J. HARMAN AND CO. have sent us a copy of the new catalogue of Vinot-Deguingand cars they have just issued. It gives full particulars of the various models, while the illustrations of the different types of cars are supplemented by views of the motor, change-speed gear and other parts of the chassis.

IN a hill climbing match recently held on Viaduct Hill, New York, between a 35-h.p. Pope-Toledo car, driven by Mr. J. Judge, and a 35-h.p. English Daimler, piloted by Mr. H. N. Harding, the latter proved the victor, making the ascent of about 2.5ths of a mile up an average grade of 15 per cent. in 33.45 sec.

THE new Arrol-Johnston 12-15-h.p. and 18-h.p. cars made an ascent of Loch Striven Head a few days ago, the latter being the identical vehicle which won the Tourist Trophy. The use of a gradometer revealed the fact that the worst gradients were 1 in 3½ (near the summit), 1 in 4½, and 1 in 4¾, the average being about 1 in 5, while the surface of the road was exceedingly bad.

MESSRS. BROWN BROTHERS, LTD., have lately brought out the "Duco" patent valve spring lifter illustrated herewith. The little tool will be found most useful for lifting exhaust valve

springs to enable the valves to be readily removed; it is small, compact, very strong, and will fit all sizes of valves. One of its great advantages is that the spring can be kept raised, leaving both hands free to remove the cotter or key.

AT a meeting of the Berkshire County Council on Saturday, the chairman of the Roads Committee said that the remedy for dust was not in the improvement of the roads so much as in an altered form of car. If the centre of gravity were kept higher, and the bottom of the car shaped canoe fashion, he thought the dust difficulty would be a thing of the past. He added incidentally that such a change would reduce the speed of motor-cars to ten miles an hour, an announcement which was greeted with shouts of laughter.

## SOME CURRENT TOPICS.

### Why Wait?

From the very beginning of automobilism there have always been a number of persons who have announced themselves as firmly determined to buy a motor-car some day, but who have been waiting, and are still waiting, for what they consider a "perfect" vehicle. Of course, many who express such sentiments are not sincere, and are merely endeavouring to disguise an inability or a disinclination to expend the price of a good car, but undoubtedly there are others who are actually waiting in good faith for the coming of their ideal vehicle. Their idea is that some wonderful system will be brought out which will render all present machines fit only for the scrap heap, and so they wait and wait, missing years of enjoyment, for the car which never comes. As a matter of fact there is very little probability that the car absolutely perfect in equipment and

it obsolete before he receives an adequate return on his investment.

### Labour Troubles in the French Motor Industry.

The general strike movement in France inaugurated on the 1st inst. has spread to the motor industry, especially at the works at Courbevoie, Puteaux, and Suresnes, to the west of Paris. The principal demand of the men is a reduction in the weekly hours of labour from 60 to 54 hours. A few small firms are reported to have made the concession, but the larger concerns are standing firmly together, with the result that strikes have been declared at, among others, the C. G. V., Gladiator, Lacoste, Krieger, Vinot, Darracq, and De Dion works. On Friday a disturbance occurred at the De Dion factory, where a number of the strikers got inside the works and damaged a few of the machine tools and one or two finished cars. Since then a number of soldiers have been drafted into the district, with the view of quelling any further disorder. The strike has also extended to several of the large works in the provinces, including those of the De Dietrich and Peugeot companies. The suspension of work is naturally seriously interfering with the trade, and the outlook for importers in England and America

Mr. Warden on an Oldsmobile Ascending the Water Chute at Princes' Park, Melbourne. This has a gradient of 1 in 34, and is 220 ft. long.

satisfactory in price will ever come, and there is nothing in the history of other important inventions, such as the bicycle, the sewing machine, or the many applications of electricity, for example, to warrant such expectation. In almost every case the differences between the models of the last year or so and those of the present day are comparatively unimportant, and while many small improvements have increased the efficiency and modern methods of production have lowered the prices of the apparently perfected article, the fundamental principles of operation remain the same.

### No Startling Innovations.

It is the general opinion of well-known constructors and others best qualified to judge that the lines on which future development in automobile construction will take place are already well defined. The tendency is not for startling innovations, but rather for taking existing systems and gradually improving them, as experience shows that such is advisable; but even this process must be very gradual. The would-be automobilist may therefore safely go ahead and purchase the car which best meets his requirements among existing models, with a certainty that no revolutionary inventions will make

is anything but bright, especially in view of the fact that in many cases deliveries were, even before the strike, considerably behind time.

### A Shock Absorber Competition.

As mentioned in our last issue, the "Auto" is organising, in conjunction with the Ligue des Chauffeurs, a competition of shock absorbing devices. The object of the competition is to reduce the vibration and motion to which the occupants on the back seats of a car are subjected when the road is at all rough. Briefly, the scheme consists in fixing a receptacle to the floor of the vehicle, at the back, in which will be placed two or more open wide-mouthed bottles, filled to the brim with water. The cars will then be driven from Paris to Bougival and back, *via* Nanterre and Rueil, within a maximum pre-arranged time. At the end of the trial the contents of the bottles will be carefully measured, and all those competitors who have not lost more than the maximum quantity allowed—to be fixed later—will be awarded a certificate. In order to give an equal chance all round the tyres will be required to be fully inflated, although cars with spring wheels will also be allowed to enter. The event promises to be of both an interesting and useful character.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

### THE MOTOR CAR ACT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have just had an experience with what I believe to be a new police method for extorting fines from the motorist, and if they are within their rights in acting as they have done, I think motorists might as well sell their cars, and the manufacturers close their works. I was driving from a town in Essex to Cambridge, and saw no signs of police either in the villages or between. A few days after, on returning home, I found a letter from the superintendent of the police asking for the name and address of the driver of car No. —, and giving me notice that the matter was under consideration with a view to taking proceedings against me for exceeding the speed limit between two villages which he named. I did as requested, as I believe I am obliged to do so under the Act of 1903. I am now waiting developments.

Do you know if the police are within their rights in issuing summonses in this manner, without attempting to stop the car and give

of the *M.C.J.* will lend his valuable assistance and support in endeavouring to stop the use of this public nuisance.

I feel sure all considerate and thoughtful motorists who truly have the cause of automobilism at heart, and who wish to enjoy the pleasures of the road with other users in comfort, will agree that it is much to be deplored that such a diabolical invention should be used in face of the bitter prejudice already stirred up in the public mind against motorists and the dust nuisance, without adding another terror and nerve destroying device and one which has a tendency to raise more dust than ever.

I consider it most selfish and inconsiderate of those who are adopting it, and it is these people who have no consideration for others, but simply live for themselves, who, caring nothing for the comfort of others, adopt it for the sake of obtaining a little more h.p. out of their cars to tear and scorch over the country, who will in future legislation do harm to the movement.

I have just received a letter in answer to mine from one of the leading motorists of the country, who replies:—"Re exhaust cut-outs, I think these quite unnecessary—we have had many inquiries, and people asking for them. I have had one fitted to my car, and have been trying it in France very carefully, and I can find no advantage in using it, and I think it a most undesirable adjunct on a motor-car."

I have written to the A.C.G.B.I. and the Motor Union on the matter, and trust that steps will be taken to make the use of this device illegal, if such can be done.—Yours truly,

J. R. GREATOREX.

Hon. Correspondent A.C.G.B.I. and Motor Union.

The Essex Club's Hill Climbing Competition at Laindon. Mr. Burnett Tabrum starting on his 12-h.p. Wolseley. (See page 250.)

one a chance to obtain evidence in one's favour. I should like to have challenged the watches and the distance, and also called my passengers as witnesses, but this is impossible now, as I do not even know the place at which I am supposed to have exceeded the limit.

This method must surely reduce the whole thing to a farce; a policeman has simply to take our numbers and we are compelled by law to incriminate ourselves. A burglar has a better chance; they at least have to be identified. Also it is impossible to warn others of the trap (if it exists at all) either by confetti or cycle scouts, as the location is unknown.—Yours truly,

F. H. M.

[According to the Act no person shall be prosecuted for the offence of exceeding the legal limit unless "he is warned of the intended prosecution at the time the offence is committed, or unless notice of the intended prosecution is sent to him within such time after the offence is committed, not exceeding twenty-one days, as the court think reasonable." This is one of the anomalies of the Act which should be removed. Prosecution should only be permissible under this section when the motorist is warned at the time; otherwise it is often impossible to obtain local evidence which might secure an acquittal.]

### AN OBJECTIONABLE DEVICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am very glad to see that some other motorists besides myself are raising a protest against the most objectionable device known as "exhaust cut-outs." I quite agree with your correspondents "Twenty-miles-an-Hour" and "Eight-horse Motorist," and I trust that the Editor

### SLIDING CHANGE-SPEED GEARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter under this heading in the *M.C.J.* of the 28th ult., I beg to say I am the patentee of three change-speed gears, one of which is of the sliding type. With this gear it is possible to change speeds without any grinding or tearing of the teeth; in fact, the edges of the gear wheel teeth are not filed or cut away as is the usual practice. I have also provisionally protected a device which, fitted to any type of sliding gear (any speeds) will make it absolutely foolproof, the gear wheels sliding into mesh without any grinding or noise whatever. This device will shortly be placed on the market. I may say it can be fitted to any existing gear at a very slight cost.—Yours truly,

HENRY W. WALKER.

### THE MOVEMENT IN CANADA.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be in London again shortly, when I shall be pleased to give you a fuller report, if you wish, of my impressions re the motor trade in Canada. In the meantime, however, I may say that a very wrong impression has been given by some recent papers read and published in England, the trade over here being neither so extensive (the population of this large country only being about the same as London), nor so easy to capture as some people interested in motor shows would have us believe. Also a majority of European cars are not suitable for this country in many details, such as clearance, wheel gauge, size of

wheels and tyres, cooling arrangements in the hot weather, protection of lubricating oil pipes and other parts from freezing in the cold weather, spring suspension, and last, but not least, strength to stand the bad roads.

I have found the roads in the immediate neighbourhood of Montreal good as roads go over here, but within five miles of Toronto I had an experience of being stuck fast in mud well over the axles (34 in. wheel) on a main road. It took six hours, and the assistance of men, boards, horse and engine power, to get us out of the mud hole. I demonstrated most satisfactorily to myself that for many months of the year Canadian roads, in some districts at any rate, are quite impassable for motors. I spent the Easter holidays at Ingersoll, a small place about 100 miles west of Toronto, where I sampled the roads by means of horse and buggy, and found the conditions just about the same as outside Toronto. Taken as an average, November to May must be considered as a close season for motors. Conditions of most of the country roads—winter, snow; spring, thick mud; summer, thick dust.—Yours truly,  
**ERNEST ARNOTT.**  
 Montreal.

### THE AUTOMOBILE ASSOCIATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I inform your motoring readers that our well-known cyclist organisation will at an early date be extended to the Bath road? Our cyclists are picked men, trained with great care in order that the policy of the Automobile Association, namely, the creation of a better understanding between all users of the roads, may be faithfully carried out. In view, therefore, of the excellent work now being done on other main roads, and for the reason that we wage quite as determined

three types, and when a driver came for the Club certificate on the well-known English car, the Lanchester, the officials did not know what to do, as none of them knew anything about a Lanchester, and at first did not want to examine the driver, but they finally decided to test the driver, passed him, and gave him the Club certificate. Might I ask of what value that Club certificate is? Now I should like you to publish some letters as to doings of the Automobile Club, as why should the whole of England be controlled by just what the officials in London want, or to what does not quite please them?

What I particularly want to point out is the system on which the Automobile Club is run. There is a certain set who have got together, who propose one another at the ballot year after year for the committee, and unless you belong to that committee it is impossible to get justice done to anybody else. Of course they assist the trade to their utmost, but to see that people get fair play is not a thing they go in for.—Yours truly,

**F. FORESTER.**

The letters to which Mr. Forester refers are, unfortunately, too long for full publication. Briefly they are as follows:—

From Mr. Forester to Mr. A. Stanley, as chairman of the A.C.G.B.I., calling attention to the election of Mr. S. F. Edge to a vacancy on the committee after he had failed to secure election in the members' ballot a fortnight before; also to the striking off the list of applications for official repairers the name of a local petrol agent by Mr. Orde owing to a difference of price.

From Mr. Stanley to Mr. Forester in acknowledgment of the foregoing and to say that those who had worked with Mr. Edge "took the first opportunity of a vacancy on the committee to elect him."

The Village of Vibraye.

A straight stretch between St. Calais and Berfay.

### VIEWS OF THE SARTHE CIRCUIT, ON WHICH THE RACE FOR THE GRAND PRIX DE L'A.C.F. IS TO BE RUN.

war against the furious driver as we do against the iniquitous open country motor trap, my Committee hope that the Bath road extension will attract a large number of local members. Upon this the continuance of our work must necessarily depend.—Yours truly,

**STENSON COOKE.**

### IGNITION TIMING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a four-cylinder 12-16-h.p. Peugeot car, 1904 model. I find the spark fires when the piston is down about half an inch of the explosion stroke. I always had the impression that the spark should occur just before the connecting rod was over the centre. In this case it is over the centre by half an inch. The contact maker is driven by chain on dash, and engine seems to work all right.—Yours truly,

**J. E. HENDERSON.**

### A.C.G.B.I. METHODS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see that in 1904 there were several letters in the motor journals as to how to save the Automobile Club, and as far as one can judge it has got from one set into another. First of all, I should like you to draw the attention of the public in your journal to the incompetent Automobile Club officials, or experts, whatever you like to call them, who are sent round to the different towns to pass motor drivers for the Club certificate, for which I believe a heavy charge is asked. Now it has come to my knowledge that in Shrewsbury, the other day, three officials were sent down whose knowledge of cars was restricted to about

Mr. Forester to Mr. Stanley, enclosing copy of letter from Mr. J. Orde to the local repairer refusing application as, "judging from my experience, it is evident that you are quite unsuitable."

Letter from Mr. Groves to Hon. F. Forester:—

When Mr. Orde called at my private house on Sunday, December 3rd, 1905, I was not appointed official repairer to the Automobile Club, and was there for the convenience of any motorist who might call for petrol on a Sunday. I have never been asked by the Automobile Club to contract for motor spirit, and I only charged Mr. Orde the same as I charge other parties on a Sunday. We all arrange a certain tariff in Shrewsbury.

Mr. Stanley's reply that he did not think the committee deserved censure.

Mr. Forester's acknowledgment of the "strength of the rules of the Automobile Club in favour of the club committee," and asking if the price of petrol to officials of the Club was to govern the appointment of repairers.

Mr. Stanley's reply promising that the complaint shall be inquired into.

[We would suggest to Mr. Forester that avoidance of political references would not detract from the value of his correspondence, but rather add to the weight it is calculated to carry with a committee that abjures politics in its official capacity.]

### A PEUGEOT CAR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the query under this heading in the last issue of the *M.C.J.*, I should advise "Sailor Man" to have his back axle seen to without delay, as without doubt this is very much worn to allow the

wheels to spread. I should hardly think a new axle was necessary if new bearings were fitted; unless, of course, the case has become strained out of true. But in any case it should be seen to, as, in the event of the axle giving out, the result may not only be disastrous, but it is very risky trusting to it when known to be faulty.—Yours truly,

J. H.

### ALLEGATIONS OF PREJUDICE DISPROVED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the Press of January last a lengthy report was given of an ex-parte application before Justices Ridley and Darling, in which it was alleged that, as a justice of the peace, I was biased in hearing a motor-car case at Chelmsford because I was the editor of the *Essex Weekly News*, in which paper a report in reference to the matter had been published, and that I had been in correspondence with the solicitor for the defence upon the subject.

I shall be obliged if you will, in fairness, allow me to say that the rule was discharged, with costs, by a Divisional Court on Friday, presided over by the Lord Chief Justice, and that Mr. Justice Darling, who was one of the judges who granted the rule, and who sat in the Divisional Court on Friday, in his judgment stated that he did not understand the facts in anything like the form in which they were now presented before the Court, and that the allegations which had been made against me had been absolutely disposed of by the affidavits which had been made in the case.—Yours truly,

GEO. W. TAYLOR.

Motor-Cycling in Japan.

[Automobil Welt.]

### THE USE OF THE TRADERS' MARK.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In a business we are opening we shall be buying and selling motor-cars and having them on hire. We cannot gather from the Motor Car Acts whether the general identification mark referred to in proviso (b) to sub-section (4) of section 2 of the Act of 1903 will cover such cars when they are being let out, or when we are using them ourselves, or whether we shall have to get the registration of such cars transferred from last owner.

We presume we shall require a general identification mark in any case to cover us in trials of customers' cars. Can you inform us as to the cost?—Yours truly,

A NEW FIRM.

[The general identification mark is assigned to dealers or manufacturers on payment of an annual fee not exceeding £3. This mark "may be used on any car on trial after completion, or on trial by an intending purchaser," but cannot apply to vehicles let on hire. In our "Comments" we make further reference to the matter. It should be remembered that Inland Revenue charges are a separate item.]

### TIMING EXTRAORDINARY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—At Milnthorpe, near Kendal, there were heard before the local magistrates recently three cases for driving above the legal limit. The evidence given by two policemen who worked the trap was, that over a measured quarter of a mile, the Hon. Geoffrey Howard, M.P., in a powerful motor-car (30-h.p. Napier, I believe) travelled the distance in thirty-five seconds, timed by a stop watch and an ordinary watch; a 16-20-h.p. Clement car did the same time exactly, and a motor-cycle did the same time. Three vehicles of such dissimilar power were sworn to have done

this remarkable performance, and yet there are people who do not believe in miracles, nor justices' justice. But the magistrates convicted on this evidence.—Yours truly,

GEORGE TRESNON.

### CHARGING ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you, or any of your competent readers, would advise me as to the best way of charging the accumulator of my two-cylinder car from thirty-two E.P.S. cells with smallest waste and at least cost. Could it be done by coupling two of the cells to the accumulator, or should I couple three cells and insert a small resistance? I do not wish to have a lamp in use all the time if it is not necessary.—Yours truly,

R. J. WESTON.

[To recharge a 4-volt accumulator from cells forming part of a lighting set, it is necessary to connect up to three cells of the large set, and put a resistance in series with the accumulator being charged. Two cells would not be sufficient, because the voltage will only balance with the small accumulator, and three cells would be too much. Therefore the resistance is necessary. If a small ammeter is connected in the circuit, the amount of the resistance can be regulated to obtain the right charging current. It is advisable to charge from those cells in the large set which are used as the spare cells, these being, as a rule, under-worked, and charging from them should make no difference to the whole set when it is in use. This method of re-charging is the most efficient, and there is practically no waste of voltage, and it is also very regular and certain. Care must be taken to connect the positive terminal of the 4-volt accumulator to the positive pole of the accumulators, which is usually painted red. If the connecting bolts of the E.P.S. cells are loosened to make connections, they should be well tightened up after charging, as loose connections heat up and cause trouble.]

### THE VAGARIES OF "JUSTICE."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Recently at the Brighton Police Court a motorist was fined £10 for exceeding the speed limit. Immediately afterwards a chauffeur from a trade firm who was said to have driven a 20-h.p. Leon Dusek on the Madeira Road at *sixty miles an hour* (while one policeman averred that it passed like an express train) was let off with a £5 fine. Why do magistrates differentiate in this way? Is there one scale of fines for the motor trade and one for private owners? Possibly, motorists would be indebted to you if you would ventilate this question in your valuable paper, as, if law courts are supposed to dispense justice, it should not be possible to fine one man £2 and the next £20 for practically the same offence.—Yours truly,

ADLEY TOLKIEN.

### THE DRIVING EXAMINATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to some recent remarks concerning the excessive cost of obtaining the Club's driving and mechanical proficiency certificates, I am pleased to say it has been an undoubted advantage to me to hold them. It facilitates the obtaining of employment and enables men to get the best wages for their services, and what is more still to the credit of the Club, they often put qualified drivers in situations, which is in itself a great benefit for a man out of employment, so personally I have not regretted the expenses incurred for the examination. I also endorse Mr. Orde's statement that it is a thorough and unbiased examination both for ability and character.—Yours truly,

DRIVER-MECHANIC.

REGAL CARS.—"A. G. R." writes:—"I am the owner of an 8-h.p. single-cylinder Regal car, De Dion engine, and am thinking of having some small alterations made. Could any readers favour me with the name and address of the London agents of the Regal vehicles?"

FUEL FOR STEAM CARS.—"J. M. A." writes:—"Would you or any of the readers of the *M.C.J.* kindly inform me where I could procure what is termed "Borneo Spirit," or other cheap grade petrol, for use on steam cars?"

TYRES.—"F. C." writes:—"Will some of your readers who have used both the Hopkinson solid tyre and the Ducable cushion tyre kindly give me their experience and their opinion of them after sufficient trial?"

MR. A. HORDEN, Scott Road, Beckenham, Kent, will give £50 reward for information leading to the apprehension of the thieves who stole his car, a 15-h.p. Panhard of the 1903 type, from his garage recently.

THE Beaufort Motor Company write that they are well able to hire out motor-cars, wagonettes, lorries, and vehicles as required by the Scottish hotel proprietor writing last week.

NUMBER PLATE BT 195 has been found. The owner can have it on application to A. H., 16, Wharncly Road, Loughborough.

THE NEW LEADER CARS.—"R. C." writes:—"Will any of the users of new Leader cars give their experience of same?"

## CLUBS AND ASSOCIATIONS.

### THE ROADS IMPROVEMENT.

At the annual meeting of the Roads Improvement Association, held on the 4th inst., at 1, Albemarle Street, Piccadilly, W., Mr. Robert Todd, who took the chair, in moving the adoption of the annual report, dwelt at length upon the "dust question," which is being taken up very seriously by the Association. He said it was very difficult to convince local highway authorities that a good road was cheaper than a bad one. It might cost a little more to construct in the first instance, but the cost of maintenance would be reduced to a minimum, and moreover a properly made road was practically dustless. The fault was to be found in the use of improper binding material. Too much mud and dirt were used by the majority of road makers.

The Rt. Hon. Earl Cadogan, K.G., was re-elected the president of the association. Other officers elected were the Hon. Arthur Stanley,

La Givre (Mr. J. Virgo-Vincent), Nore (Mr. L. Miles), De Dion (Mr. J. S. Holmes), Noyalen (Mr. J. Stirling), Bouton (Mr. J. W. Stocks), Arab (Mr. H. J. Walker), Javelin (Mr. A. G. Fentiman), Napier Major (Mr. S. F. Edge), Penelope (Mr. S. Wilensky), Marguerite (Mr. E. Illy), Iniada (Mr. F. B. East), Bobolink (Mr. F. C. Keller), Alaric (Mr. E. H. Heinke), Skidbladhir (Mr. G. W. Cobham), Trial (Mr. A. W. Bradbury), Tua (Mr. H. Meinhardt), and Janus (Mr. Seymour Harger).

### MANCHESTER MOTOR CLUB.

THE club held its first competition of the season on Saturday, up the Snake Hill, near Glossop. There were 29 entries and of these twenty-five competed. The hill course of one and a half miles starting from the "Shooting Box" corner has an average gradient of 1 in 12, though in places it steepens to 1 in 6 or 8, and of the twenty-five competitors only twelve managed to reach the finishing point. The results were as follows:—

- 1.—A. V. Baxter, 5-h.p. "Vindex" Motor-bicycle.
- 2.—H. Hurst, 32-h.p. White and Poppe Tri-car.
- 3.—A. H. Albert, 34-h.p. "Quadrant" Motor-bicycle.

The winner did a fast performance and takes no less than four prizes, including the club gold medal, the "Humber" vase (held one year) and two special prizes offered by the president, Mr. Dawley Brown, for the winner and best time. Hurst, the second man, being on a tri-car with single-cylinder engine, takes three prizes.

M.P., vice-president; Mr. Robert Todd, chairman; Mr. W. Worby Beaumont, M.Inst.C.E., vice-chairman; and Mr. W. Rees Jeffreys, hon. secretary and treasurer.

### IRISH.

At the last committee meeting of the Irish Automobile Club some modifications were made as regards the Reliability Trials and Hill Climb for the 13th, 14th, 15th, and 16th of June. It was decided that there should be two independent classes, one for amateur drivers, who are ordinarily resident in Ireland as members of the I.A.C., who are not connected with the trade, and the other an open class, in which both the trade and amateurs may compete. The full conditions will be published shortly, together with the formula on which the marking, so far as the hill climb is concerned, will be based.

### BRITISH MOTOR BOAT CLUB.

THE opening meet of the British Motor Boat Club took place at Kingston on Saturday. Admiral Sir William Kennedy, K.C.B., led the flotilla of launches belonging to members of the club up-stream. The commodore, who was accompanied by the vice-commodore, the Marquis of Ailsa, and Lieut-General Sir W. Wright, was on board Elgiva, and as he left the landing-stage the following boats dropped into line: Fulsked (Mr. Miall Green), Flemette (Mr. Oswald Colls), Ayesha (Mr. L. Miles), Lellis (Mr. L. M. Waterhouse), Stirling (Mr. J. Stirling),

F. W. Newbury, 2-h.p. Minerva, who finished tenth in order of merit, also takes a special prize offered for best time accomplished by engines 80 by 80 mm. or under.

The other placings were: 4, A. J. Moorhouse (Chase); 5, T. Linnell (Quadrant); and 6, H. Andrews (Jap).

After the event over sixty members sat down to tea at the Norfolk Arms Hotel, Glossop, amongst the guests being Superintendent Savory, the local chief of police, to whom a vote of thanks was cordially passed.

### AUTOMOBILE AND CYCLE ENGINEERS' INSTITUTE.

A FURTHER meeting of the Automobile and Cycle Engineers' Institute was held at Birmingham on Thursday, last week, in connection with the proposal to transfer the headquarters of the Institute to London. Mr. A. E. Tucker (president) occupied the chair, but the members present were again not sufficient to form a quorum, very little interest apparently being taken in the proceedings of the Institute in the Midlands. The position was discussed in an informal manner and the business was then taken in hand by the council to deal with under the power conferred upon them by the rules. The council decided to recommend to the forthcoming annual general meeting of members several alterations in the rules which in effect would transfer the headquarters of the Institute to London. Officers were nominated for the ensuing year, including Lieut.-Col. Crompton, who was proposed

as president, and Messrs. G. Douglas Leechman and E. H. Godbolt (vice-presidents).

### THE SOCIETY OF AUTOMOBILE MECHANIC DRIVERS.

MR. A. R. IVENS having resigned the secretaryship of this society, Mr. Percy Loring is now acting as secretary *pro tem.*, and communications should be addressed to him at 51, Brick Street, Piccadilly, W. The society has been working quietly for nearly two years, and we are asked to publish a summary of its objects and rules, which are concerned with the efficiency and character of motor-car drivers, with a view to the mutual welfare of all concerned. It does not deal with questions of salary. Among contemplated activities is the provision of a club room for the interchange of ideas, the establishment of an employment bureau, and the giving of advice to drivers who may have to journey abroad. No mechanic-driver will be eligible for membership who has not had three clear years' experience in the profession. The entrance fee is 7s. 6d. and the monthly subscription two shillings.

### HERTFORDSHIRE.

At the Sun Hotel, Hitchin, a number of members attended on the second club meet of the season on Saturday. Amongst those present we noticed Mrs. and Miss Anderson (Panhard), Mr. and Mrs. Blakeley

A Bo Kow, the famous Juggler, who is known on the Continent as the Monte Carlo King, at the wheel of his Swift Car.

Photo by

[Ritton.]

(Miesse), Mr. and Mrs. Spence Brown, Mr. Hobson, Dr. and Miss Hickman (M.M.C.), Mr. Albin Hunt (Mors), Mr. and Mrs. Jay (Crossley), Mr. and Mrs. C. McWhirter (James and Browne), Mrs. Monro (tri-car), Mr. E. T. Pryor, Dr. Rudyard, Mr. Claude Watney (Pipe), Mr. and Mrs. Webster (Mors).

In the unavoidable absence of the hon. sec. a member of the committee called the attention of members to the forthcoming "Consumption Trial" for petrol cars, on Saturday, the 19th inst., and the Motor Union meet at Birmingham on the 26th inst. The chairman, Mr. McWhirter, strongly advocated attendance of members at this representative gathering of motorists.

### NORTH LONDON.

THE second run of the season took place on Saturday to Harpenden, where tea was taken at the George Hotel by forty-eight members and friends. Col. H. F. Bowles, the president of the club, took the chair.

After tea the first of the club competitions was held, the idea being to start, stop, reverse, start again and reach a given point, on a hill. The result was as follows:—

			Sec.
1st.	Chas. Smith ...	12-h.p. Darracq ...	49 4-5
2nd.	Max Graddon ...	24-h.p. Panhard ...	50
3rd.	Branson Griffiths ...	10-12-h.p. Humber ...	52 3-5
4th.	E. Swinger ...	8-h.p. De Dion ...	56 2-5
5th.	G. Smith ...	12-h.p. Darracq ...	59
6th.	R. W. Paul ...	10-h.p. Wolesley ...	63 1-5
7th.	W. Cornwall ...	16-h.p. Albion ...	66 1-5

Messrs. Horton and Cutler also started.

Col. Bowles will entertain the members and their friends at Forty Hall, Enfield, on the 26th inst.

THE Sheffield Automobile Club will have a motor-car run for crippled children on the 14th prox.

By permission of the Automobile Club, the committee meetings of the Aero Club will now be held at 119, Piccadilly. Lady Bowen has been elected to membership.

### NOTTINGHAMSHIRE.

THE meet of the Nottinghamshire Club on the private road of the Duke of Portland at Welbeck, on Saturday, was a great success. There were four events on a card which provided a full afternoon's entertainment, and from the club's point of view the most important was the Flying Kilometre Handicap, limited to standard touring cars, for the Wilson challenge cup and gold medal. In this the power, weight, and price of the car were all taken into consideration in framing the handicap, and how well the committee had done their work was proved by the fact that at the finish it was impossible to decide between Dr. Hogarth, who drove his 12-16-h.p. Talbot, and Mr. Spencer Downing, who had a 10-h.p. Alldays. Both cars will have to be further weighed before the committee can arrive at their verdict, and, needless to say, the result is being awaited with considerable interest. Twenty-three out of the thirty cars entered competed, and remarkably fast times were accomplished by some of the higher-powered motors. The competitors were as follows:—

#### FLYING KILOMETRE HANDICAP.

R. G. Hogarth, 12-16-h.p. Talbot	...	...	...	+
Spencer Downing, 10-h.p. Alldays	...	...	...	+
Miss L. B. Starkey, 12-14-h.p. Argyll	...	...	...	0
W. Hutchinson, 30-40-h.p. Daimler	...	...	...	0
D. McCraith, 10-12-h.p. Humber	...	...	...	0
A. N. Lee, 8-10-h.p. Humber	...	...	...	0
E. E. Fewkes, 15-h.p. Napier	...	...	...	0
A. Metheringham, 14-h.p. Minerva	...	...	...	0
F. A. Bolton, 30-40-h.p. Daimler	...	...	...	0
H. Bircumshaw, 16-20-h.p. Richard-Brasier	...	...	...	0
E. W. Wells, 30-40-h.p. Daimler	...	...	...	0
H. Belcher, 16-20-h.p. Humber	...	...	...	0
H. Belcher (No. 2), 10-12-h.p. Humber	...	...	...	0
J. A. Doran, 22-h.p. Minerva	...	...	...	0
M. Ross Browne, 15-h.p. Darracq	...	...	...	0
R. L. Jones, 16-20-h.p. Humber	...	...	...	0
E. W. Lewis, 16-20-h.p. Rover	...	...	...	0
R. M. Wright, 10-12-h.p. Humber	...	...	...	0
C. Johnson, 20-h.p. Rolls-Royce	...	...	...	0
T. C. Pullinger, 16-20-h.p. Humber	...	...	...	0
M. Ross Browne (No. 2), 16-20-h.p. Richard-Brasier	...	...	...	0
J. C. Wilson, 30-h.p. Daimler	...	...	...	0
J. Gaskin, 16-20-h.p. Argyll	...	...	...	0

The final event of the day was a scratch test over the flying kilometre, and for this the majority of the cars were stripped of mud guards, lamps, &c., in order to reduce weight and wind resistance. Thirteen cars competed. A new 30-40-h.p. Daimler, owned by Mr. E. W. Wells, and driven by his son, Mr. W. D. Wells, secured the gold medal, but how closely matched cars and drivers were may be gathered from the fact there was not more than two seconds difference between the first four. The placings were as follow:—

#### FLYING KILOMETRE (scratch event) for gold medal.

E. W. Wells, 30-40-h.p. Daimler	...	...	...	1
F. Coleman, 18-h.p. White steam car	...	...	...	2
W. M. Hutchinson, 30-40-h.p. Daimler	...	...	...	3
J. C. Wilson, 28-36-h.p. Daimler	...	...	...	4
F. A. Bolton, 30-40-h.p. Daimler	...	...	...	5
J. A. Doran, 22-h.p. Minerva	...	...	...	6
C. Johnson, 20-h.p. Rolls-Royce	...	...	...	7

The success of the White car was all the more notable as Mr. Coleman did not appear to really get under weigh until after he had passed the starting line. This performance on the level should sustain the interest felt in the car's hill climbing achievements during the season.

### MANCHESTER AUTOMOBILE CLUB.

THE Manchester Automobile Club had their fourth run of the season on Saturday, the destination being Moreton Old Hall, a few miles south of Congleton. It is the custom of the club for the members to travel independently to the meeting-place, thus helping to mitigate the trouble caused by the dust which is inevitably raised in dry weather, pending such time as the authorities are able to undertake the making of roads which will be found suitable to the new traffic they have to carry. The outward run was performed by all the cars in good style, and on the return journey the bursting of a tyre was the only mishap of note.

### ESSEX.

THIS club held their hill climb and brake test competition at Laindon Hills, Essex, on Saturday last. The competitors attended at Brentwood Station, where the cars were duly weighed on the weigh-bridge belonging to the Great Eastern Railway, and they then proceeded to Laindon, a distance of seven miles.

The whole of the members and their friends were the guests of Sir Joseph Dimsdale, Bart., to luncheon at his charmingly-situated residence, Goldsmiths, on the hill. Nearly one hundred and fifty members and friends sat down to luncheon, after which a hearty vote of thanks, moved by Mr. Burnett Tabrum, J.P., and seconded by Col. W. Nevill Tufnell,

for the hospitality of Sir Joseph and Lady Dimsdale, was carried with acclamation. Sir Joseph placed one of his meadows at the foot of the hill for the use of the members as an enclosure, and assisted the club in every possible way. The whole of the proceedings were ably carried out by the officials, among whom were:—Judge, Col. W. Nevill Tufnell; clerks of the course, Messrs. L. W. Dent, E. A. Serre; marshals, Messrs. W. Forster, G. Earle and V. E. Castellan; timekeepers, G. N. Finlay and the official timekeepers of the A.C.G.B.I.; clerk of the scales, Mr. W. Forster; starter, Mr. T. Clarkson; signallers, Messrs. L. C. Clayton and S. Fearn; secretary of the meeting, Mr. F. Lindus Forge.

Twenty-six cars had entered the competition, but only the following put in an appearance at the start, although thirty-five cars attended the meet:—

Mr. J. Gurney Fowler	...	24-h.p. Panhard.
Mr. Burnett Tabrum	...	12-h.p. Wolseley.
Mr. F. P. Cayley	...	6-h.p. De Dion.
Sir Charles B. Locock, Bart.	...	16-h.p. Fiat.
Mr. R. L. Curtis	...	7½-h.p. Wolseley.
Mr. Japh Mason	...	10-h.p. Royal Enfield.
Mr. Japh Mason	...	26-h.p. Simms-Welbeck.
Mr. J. R. B. Newman	...	18-h.p. Mercedes.
Mr. E. E. Bentall	...	8-h.p. Crypto.
Mr. C. E. Castellan	...	24-h.p. Elswick.
Mr. Arthur J. Mills	...	16-h.p. Gladiator.
Miss Edith Miller	...	10-h.p. Panhard.
Dr. Butler Harris	...	15-h.p. Ariel.
Mr. E. E. Bentall	...	16-h.p. Richard-Brasier.
Mr. B. W. Tolhurst	...	20-h.p. Lancaster.
Mr. F. Lindus Forge	...	14-h.p. Star.
Mr. F. Lindus Forge	...	7-h.p. Star.
Mr. Robert Page	...	20-h.p. Mercedes.

A stop had been arranged half-way up, and at the steepest part of the hill, having a gradient of one in seven, cars had to stop within a marked space of ten yards for thirty seconds, and the restarting proved to be a very severe test, as several cars failed here. After arriving at the finish the cars returned by another route down into the members' enclosure.

The quickest time was made by Captain Newman, and the second best by Mr. J. Gurney Fowler, but, as the competition was a handicap, the quickest time is not necessarily the winner. The handicap has not yet been worked out, but will be notified in the *M.C.J.* in due course.

THE Norwood Motor Club held a run to Sevenoaks on Saturday. On Sunday they went to the Old Ship Hotel, Brighton.

A MOTOR cycling club is being formed by Mr. R. M. Stevenson, 54, Truro Road, Wood Green, N.

MOTOR-CYCLES will be started before the cars in the Motor Cycling Club's run to Edinburgh.

A MEETING of the Kent Automobile Club was held at Folkestone on Saturday, the following members being present:—Dr. C. M. Vernon, Mr. Harold F. Holman, Dr. C. H. Tamplin, Dr. C. A. White, Mr. S. H. Page, Mr. W. P. Bolton, Mr. A. H. Reed and other members and friends.

ON Wednesday, the Cardiff Motor Club held a hill-climbing competition for motor-cycles at Pentryrch Hill, Taff's Well.

### A SCHOOLBOY'S VIEWS ON MOTORING.

A TEACHER at a County Council School in South London instructed his boys a few days ago to write a short essay on any subject they liked. Motoring was the subject chosen by one of the boys, whose effort we reproduce below:—

My father as got a motor. It is not so very big, but it holds us all. The number of it, is A \* \* \* \*; that means London. The horsepower is 8 it goes 20 miles an hour. It can go more than that, but the police won't let you, on Saturday there were three motor's, first one was a very big one, and second one, was about the size of our own. The first one I mentioned, was going more than 20 miles an hour, and the police made us all stop. He said it was not the last two, but the first one. If he did have a fine, that would mean 5 pounds out of his pocket. We have had our motor 2 years this month. We have never had a fine, and we don't wish to have one. And we never had an accident; it goes pretty quick. I love going in it, and I like going in other ones as well. We have been to Blackpool and plenty of other places as well on it. I wish we had a shade on it, as it would keep the rain off.

### ROAD REPORT.

WEST SUSSEX.—The West Sussex County Surveyor reports that the main roads as a whole have been well maintained during the past year, and that, with a few exceptions, their condition has been improved. The increase in motor and other heavy traffic has been considerable, and several experiments have been carried out during the year with a view to the abatement of the dust nuisance, and also with a view to finding a more economical form of road maintenance. So far, the Surveyor reports, these experiments have proved fairly successful, but it is yet too early to give an opinion as to the saving, if any, over the old form of maintenance. The experimental patch of tarred material laid on the Horsham and Brighton road, near Lower Beeding, after four years, is still in splendid condition, and shows little, if any, signs of wear.

### THE MARKYATE ACCIDENT.

AT Hemel Hempstead last week, Albert Carter, chauffeur to Mr. C. W. Preston, of Lancaster, who was fatally injured in a motor-car accident at Markyate Street, Bedfordshire, on the 30th ult., was charged with the manslaughter of Mr. Preston.

P.S. Boarder said he was in his house at Markyate Street, and heard a motor-car pass the front door. He said to his wife, "That is going at thirty miles an hour." He rushed to the door to try and take the number, but could not, as the car was travelling fast out of sight. A few minutes later he heard of an accident in the direction in which the car was going, and, jumping on his bicycle, he rode to the scene, at River-hill cross roads. He there saw a horse lying on the road with one leg nearly cut off. A cart was lying upside down, and there was a motor-car about twenty yards away. Horace Peddar, who had charge of the cart, was lying in the road shouting, "My legs are broken!" He assisted him, and then saw Mr. Preston lying by the side of the road with severe injuries to his head. Mr. Preston was conscious, and said in a low tone, "Are we to blame?" He replied, "I don't know." The witness then asked the chauffeur if he had sounded the horn, and he replied "Yes, all along the road." There were danger signals at the cross-roads where the accident happened. The accused was remanded, and bail was allowed in £100.

At Hemel Hempstead on Tuesday the chauffeur was charged with manslaughter. Mr. J. Murphy, who prosecuted for the police, said that when the accident happened the prisoner had driven the car from Coventry to Markyate, a distance of sixty miles, in two hours. It was for the Bench to decide whether that was a reckless speed. The case was adjourned until Saturday, the 12th inst., bail being allowed.

The adjourned inquest in connection with the Markyate motor accident took place on Tuesday afternoon at Hemel Hempstead Infirmary. Horace Peddar, the man who was leading the horse and cart into the

The Midland Railway Company's Special Motor Car Van.

main road when the collision occurred, and who sustained a broken leg, in evidence taken at his bedside, said he heard no hooter. He thought he could get across the road before the motor passed, but it seemed to come upon him all of a sudden. It was some distance away when he first saw it, but did not appear to slow down. The jury, after deliberating an hour and a half, disagreed, voting ten to three in favour of negligence on the part of the chauffeur. The coroner accordingly adjourned the inquiry to the date of the Herts Assizes, June 27, for the judge to direct the jury.

### THE EMISSION OF SMOKE BY MOTOR-BUSES.

THE Motor Omnibus Company (Limited), of Albany Street, Regent's Park, has been summoned for using at London Road, Southwark, on seven days, locomotives which emitted smoke, vapour, and smell to such a degree as to be a nuisance to the public. The magistrate, Mr. C. Chapman, in giving a considered judgment, said the question raised in these cases was whether the words "and consuming as far as practicable their own smoke" were meant to cover the case of negligence by a servant. It was not free from difficulty, but after considering all the cases bearing upon it he had come to the conclusion that the general words were intended to cover every sort of failure which was not attributable to temporary accident. The evidence which had been given for the defendants showed clearly that with really skilled drivers it was practicable to avoid any smoke being emitted from the engines, and it was not disputed that owing to over-lubrication by the chauffeurs in each case smoke was emitted. He thought the defendants were using a locomotive which was not consuming, so far as practicable, its own smoke, and were liable to the penalty provided. No sort of crime had been created by the statute, and the doctrine of *mens rea* did not apply. In "Niven v. Greaves" an owner was held liable for the negligence of a stoker, though the furnace was properly constructed, and in "St. Helens District Tramways Company v. Wood" a company using mechanical power was penalised for the negligence of a driver in not

ighting his lamps. Lord Justice Day remarked that it seemed hard upon the defendants, but they might have secured exemption by bringing the actual offender before the Court. This the present defendants had not done. However, as the case appeared to be one of first instance, and the defendant company were not to blame, they would only be fined 40s. and costs in each case.

Mr. Curtis-Bennett asked the magistrate to state a case on the point of law as to whether the owners or the drivers were responsible.

Mr. Cecil Chapman readily consented to state a case upon the first summons, and to allow the other six, which had not been heard, to stand over, pending the result in the High Court.

### THE ARGYLL PRIZE-WINNER.

WHEN the London depot of the Argyll cars was opened, prizes of £5 were offered to the drivers who completed 5,000 miles at a running cost of less than £42. The first to claim the award is W. W. Perks, driver to Messrs. Mac Dowall, Stevens, and Co., who writes:—I beg to say I have completed 5,192 miles on a 10-12-h.p. two-cylinder Argyll at a total cost of £28 19s. 5d., as per the attached copy taken from my firm's books. Nearly all my mileage has been done over some of the worst roads to be found for a radius of thirty miles round London, and the car has been on the road every day, doing an average of fifty to seventy miles, with the engines only stopped during the dinner hour. I have not been laid up once on the road.

	£	s.	d.
Petrol.—310 gallons	11	7	2
Oils.—Engine oil, 13 gallons	£2	10	0
Machine oil	0	10	0
Grease and paraffin	0	4	3
Paste, dusters, and waste	3	4	3
Renovals.—4 plugs, 6 valve springs, 1 fan belt, 2 ball races	0	13	9
Repairs and adjustments	2	9	10
Sundries	6	16	6
	0	19	9
Total	£25	11	3
Total miles run, 5,192	16	74	per gallon.
Expenditure £25 11s. 3d.	1	18	d. per mile.
Tyre.—One inner tube (not used)	1	14	0
Sundries.—1 oil can	0	1	6
1 spoke brush	0	2	6
Hose for garage	1	0	0
1 second-hand accumulator	0	10	0
	£3	8	0

### POLICE TRAPS.

A POLICE TRAP was in operation on Saturday last on the Kingston road, near the Robin Hood Gate of Richmond Park. It was apparently in control of three constables, two being in plain clothes.

The police trap at Alconbury Hill, Hunts, is being very actively worked.

A TRAP has been arranged on the Aylesbury road between the twenty-seventh and thirty-first milestones, at Little Berkhamsted and Ashton Clinton.

AT the High Wycombe police court on Saturday the police admitted that the "old police trap" had been abandoned as it was now too well known by motorists.

CORNISH readers should beware of the traps on the road between Bodmin and Truro.

THERE is a trap on the road leading from Rickmansworth Station to Cheries. The measured distance is two miles and the production of licences is frequently demanded by the police in charge. Another reader informs us of a trap on the road from Rickmansworth to Amersham. This is worked across a field, and is situated between Chorley Wood Common and Cheries.

### MOTOR-CAR ACCIDENTS.

A MOTOR-CAR, containing Mr. W. Bansted, of Wimbledon Common, and a lady named Miss Harne, was descending a steep hill at Titsey, near Limpsfield, on Monday, when the brakes failed to act, and the car rushed down the hill at a tremendous speed, swerving from one side of the road to the other. At the bottom of the hill the car crashed into a park fence, and turned a complete somersault, throwing the occupants out. The lady was injured, and the car wrecked.

WHILE Mr. and Mrs. F. G. Lucas, of Addison House, Bedford Park, and Mr. and Mrs. Dean, of Sutton Lodge, Chiswick, were motoring along the Bath road at Calcot, near Reading, on Monday afternoon, they encountered a miller's wagon, the leading horse in which swerved across the road at the approach of the motor-car. To avoid a collision the chauffeur steered towards the bank and ran into a telegraph pole, which caused the motor-car to overturn. All the occupants were thrown into the road, but no one was seriously injured, and after being attended to at a cottage near by, they were able to return home by train. The motor-car was considerably damaged and both horses in the wagon were injured.

ON approaching a crossing just outside Retford the chauffeur of

Mr. Louis de Silva the other evening seems to have misjudged the distance of the red light danger signal, and, being unable to pull up in time, the car ran into the gate, the frame of which was smashed. The occupants of the car were thrown out, but were, fortunately, uninjured beyond receiving a severe shaking. The vehicle itself was much damaged and was subsequently towed to Mr. C. Clark's garage at Retford for repair. Mr. de Silva and his driver received good attention at the hospitable quarters of the Road Club, Ye Olde Bell, Barnby Moor.

### CASES AGAINST MOTORISTS.

AT Milnthorpe, the Hon. Geoffrey Howard, M.P., was summoned for exceeding the speed limit. The police evidence was to the effect that on Good Friday the hon. gentleman drove his motor-car over a measured quarter of a mile at Bentham in 35 seconds, over twenty-five miles an hour. A fine of £5 and costs was imposed. A similar fine was imposed against Thos. Parkinson, motor-car driver, of Lancaster. Defendant was driving Mr. Argles, a local magistrate, from Lancaster to Haversham on the evening of the 19th inst., and the Bentham "trap" was covered in 35 seconds. George Tresnon, draper, Lancaster, was fined £3 and costs for driving a motor-bicycle over the same course at the same rate.

ON Saturday three motorists were before the Lancaster County Bench. One, George Smith, of Leeds, was charged with exceeding the speed limit over the Burton road quarter of a mile on April 18th. Mr. Willey, of Leeds, who appeared for the defendant, cross-examined the police witnesses, commenting on the crude method of signalling, and pointed out that there were three operations necessary. First there was the signal, then the man with the watch had to receive it, and thirdly he had to set going and next to stop his watch. Those operations must take time. He also criticised the watch, and called expert evidence to show that the watch was of a type that was slow in movement for timing purposes, because when the seconds hand was stopped by the timing policeman it stopped all the workings of the watch. During the progress of the case the chairman handed down a roughly drawn sketch of the "trap" and the signalling-place to Mr. Willey, with the remark, "We know the trap very well." Both the defendant and the owner of the car, Mr. Kirk, gave evidence stating that they were of opinion they were not going at anything like the speed limit, and they were both experienced motorists. Mr. Kirk said he knew they were in the vicinity of a police trap from information given him on the road, and they drove slowly in consequence. A fine of £5 and costs was imposed.

MR. ALBERT J. ROWLANDS, of Gwynfryn, Bangor, was charged with driving his car over the Bolton road trap at 23½ miles an hour on Easter Sunday. The police evidence was criticised by Mr. Lewis, of Bangor, who appeared for the defendant, and who had been one of the passengers in the car. Another North Wales solicitor, Mr. Rowland Hartley Gascoigne, who had also been in the car, gave evidence. The point made by Mr. Lewis was that they were warned before they reached the trap by a motor-tricyclist, and that they were certain they were travelling within the limit. It was because they honestly felt they had a proper answer to the charge that the defendant and his friends had travelled from Bangor to Lancaster to defend it. Had they not been so convinced in their own minds they would have found it much cheaper and more convenient to let judgment go by default, with a letter to the Bench. A mass of evidence was given to the effect that the car was not travelling at more than fifteen or eighteen miles an hour. The defendant was fined £5 and costs, and ordered to pay costs for not producing his licence when demanded.

Place.	Summoned for	Result.
Retford	Exceeding legal limit	Dismissed.
Shoreham	Exceeding legal limit	£4, etc.
Milnthorpe	Exceeding legal limit	£5, etc.
Hove	Dangerous driving	£4, etc.
Farnham	Exceeding legal limit	£1, etc.
York	Dangerous driving	5s., etc.
St. Neots	Seven cases of exceeding legal limit	One dismissed; in others fine of £5, etc.
High Wycombe	Exceeding legal limit	£1.
Bow Street (London)	Dangerous driving	£3 3s.
Acton	Driving a motor-bus at a speed exceeding twelve miles per hour	£3, etc.
Long Eaton	Driving dangerously	£2 2s.
Nottingham	Reckless driving	Dismissed.
Gravesend	Dangerous speed	£18, etc.
Marplebone	Dangerous driving	£5, etc.
Totnes	No rear light	10s.
Haywards Heath	Eleven cases furious driving	Aggregate fines and costs £70.
Colchester	No identification mark	5s., etc.
Watford	Reckless driving	£2, etc.
Cambridge	Dangerous speed	Dismissed.
Lancaster	Exceeding legal limit	£5, etc.
Beaconsfield	Exceeding legal limit	Dismissed.
Uxbridge	Exceeding legal limit	£3, etc.

# THE

[No. 376.

**Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.**

be at the wheel of a 40-h.p. Ariel Simplex, while many of the other drivers who figured in the Trial of 1905 will again take part in the competition. Several of the new competitors are, we hear, already familiarising themselves with the intricacies of the route, which will be a pleasing variant on the first and last stages of the 1905 Trial. Edinburgh will be the first resting-place instead of Dundee, and owing to the absence of the Aberfeldy hill climb the travellers will enjoy a glimpse of Killin and its picturesque country.

### Slow Round Curves.

letter emphasises the point we made last week as to drivers going carefully round curves, particularly in unfamiliar localities, and the slowing down in narrow roads. As was then mentioned, some of the leading automobile firms issue very complete directions to their drivers on these points, and private owners should be equally mandatory with regard to their chauffeurs. Mere verbal instructions are frequently disregarded ; gentlemen should, therefore, when engaging drivers, give them written instructions as to slowing down when approaching curves and easing their speed in narrow ways. An interesting point is brought out in the letter with regard to the value of the parallel footpaths which run along many broad roads and which secure protection both to the pedestrian and to the user of the road. These may be advocated wherever the width of the highway permits, but even then all danger is not averted. There are many people in rural districts who prefer the broad carriage way as a walking ground, and who require something more than the hooting of the horn to take them to the side of the road. They constitute a problem with which the rector of Dodington and other gentlemen in like circumstances might deal.

### Necessary Lessons.

**Necessary Lessons.** TEACHERS in the schools and parsons in the villages might well join in warning young children, and older persons who have not altogether put away the habits of early days, of the dangers that lurk in disobedience to the ordinary promptings of common sense. Before crossing roads people should give heed to the traffic that can be seen or heard ; once determined to pass over the roadway they should not hesitate when reach-

ing the camber of the highroad ; that portion of the road used by carts, motor-cars, and horses is not a public playground ; pedestrians should keep to the path or the side of the road ; and a little thought should be given to the ordinary business of walking. The man who travels *à pied* must recognise his responsibilities on the road just as much as the man in the car, and the enforcement of such suggestions as those we have indicated on our rural population should be regarded as among the essentials of education.

### Mileage and Direction Posts.

**Mileage and Direction Posts.**

WHEN his chauffeur was summoned at Chertsey for exceeding the legal limit, Mr. Marshall Hall, K.C., remarked that it would be an enormous advantage to motorists wishing to keep within the law if the miles were indicated on the direction posts. Then they could accurately time the pace at which they were going. Mr. Hall was returning from the New Zealand Golf Links (Byfleet) on a recent Sunday when "captured." He was sitting beside the chauffeur, and desired the police inspector to take his (Mr. Hall's) name instead of that of the driver. It being a case of exceeding the limit, however, the officer did not do so. Mr. Marshall Hall said the police treated him most courteously and fairly. Yet he contended that it was impossible for a police officer, however good his intentions, to take the time accurately with one chronometer. There were five persons in the small car, which had just crawled over a bridge, and it was absolutely impossible to get up a speed of thirty-nine miles an hour in such a short distance. He always instructed the chauffeur to proceed very slowly over bridges, as he felt that one day a terrible accident between two cars would occur on the crown of a bridge. On his oath he believed they were not proceeding at the pace alleged by the police. Despite this, however, the driver was fined.

### A Helpful Hint.

**A Helpful Hint.**

THERE is much to be said in favour of Mr. Hall's idea being universally applied. In several districts it is already carried out, and on hundreds of milestones there are evidences—worn, discoloured and faintly legible—that mileage measurements were once made public. Possibly the clearest direction posts yet adopted by any local authority are those of the Cheddar country, where a good height and sensible lettering are characteristics that find favour. Of course we do not desire to reduce the scenery to the tameness of a map, but, just as every post office should have the name of the hamlet which it serves conspicuously painted on the outer wall, so the finger-posts might be utilised as measurement recorders, enabling travellers to judge of their rate of progression and affording useful information that all who run, or walk, may read.

### Motor-Car Imports and Exports.

**Motor-Car Imports and Exports.** ANOTHER very large importation of foreign motor-cars and automobile parts into this country took place during last month. The returns now available show that no less than 591 cars were imported, their value amounting to £224,639. Parts were responsible for a further £178,590, giving a combined

total of £403,229 as compared with only £293,903 in the corresponding month of last year and £202,499 in April, 1904. For the first four months of the year the aggregate imports have amounted to £1,527,291, an increase of nearly half a million sterling. The exportation of British-built cars continues to show a slow but steady upward tendency. Last month 62 vehicles were shipped from this country of a value of £23,645. Parts accounted for a further £16,747, the combined total of £40,392 comparing with only £26,225 in April, 1905. For the first four months of the year the aggregate exports have attained a value of £199,570, an increase of £91,120.

### An Injustice to Great Britain.

THE question which an Irish member asked the President of the Local Government Board on Monday served to illustrate one of the anomalies of taxation in this country. It was complained that Irish motor-car owners who brought their vehicles to England had to pay a tax of £2—a charge which Mr. Burns showed was levied on cars and carriages alike without respect to the power that moved them. In Great Britain the tax falls upon all carriages; in Ireland owners of such vehicles escape the infliction. Hence the confusion which arose with regard to the matter.

The Renault 10-14 h.p. Four-Cylinder Landaulet which Messrs. Renault Freres, Ltd., have just supplied to His Majesty the King.

### Not the Fault of the Motorist.

Not often does a magistrate recognise that motorists may, in spite of police evidence, be in the right when prosecuted for dangerous driving, or any of the other offences to which they are said to be addicted. A Harrogate motorist has been summoned at Bradford for driving to the danger of the public, the occasion being when he collided with a horse-drawn trap in such a way as to cause serious injuries to the driver of the latter. There was the usual police evidence as to speed, but, fortunately, other witnesses were able to declare that the horse and cart were on the wrong side of the road, and that the motor-car sought to get around to avoid mishap. This was further proved by Mr. J. G. Hammond, whose car was that referred to, and ultimately the stipendiary magistrate, Mr. C. Skidmore, said the Bench were not satisfied that the car was being driven recklessly or negligently, and they were not satisfied that it was driven at a speed dangerous to the public. The person to blame was the driver of the trap. Mr. Hammond had exercised very great care and precaution in trying to avoid a collision, which forced him upon his wrong side of the road. The summonses had, therefore, failed, and they would be dismissed. Yorkshire motorists should be thankful in the possession of such a fair-minded magistrate.

### Carrying by Motor-Boat.

PICKFORDS have already familiarised Londoners with the fact that they have eighty-three motor-vehicles in public service carrying goods and parcels to the orders of their clients. They are now appearing as motor carriers on the river, having added a motor cargo craft to their steamers which ply from London to Portsmouth and Southampton. The advent of the motor-boat to the realms of commerce is a significant event, for it suggests a new line of thought to the Canal Commissioners now sitting, and should encourage builders of such vessels to develop the commercial motor-boat just as car constructors are finding wide avenues of usefulness in the vehicle for the use of the trader.

### The Derby Club.

ALTHOUGH the Derby and District Club has been comparatively silent in the automobile world, it has done much useful work, and from the report on another page our readers will recognise the interest that attaches to some of its doings. It is more than two years since it adopted the policy of not holding organised runs, but merely appointing a meeting place, leaving the route to be selected by the members according to their individual tastes and convenience. Apparently the members are partial to hill climbs, for the second one is being undertaken to-day (Saturday), and on the 2nd prox. they will participate in the Du Pre Challenge Cup hill climb, limited to members of their own and of the Notts and Leicester Clubs. A similar event will be again contested in July. These, with a gymkhana at Burton-on-Trent and a run to delightful Dovedale, should prove pleasant alternations to the meets of the Motor Union, which will be loyally supported by the motorists of Derby.

### Motor 'Buses v. Tram-cars.

DURING the recent discussions at the A.C.G.B.I., none were of such real importance as that which followed Mr. E. Manville's paper on "The Field of the Electric Tramway and Motor Omnibus." Several leading authorities from the engineering, financial, legal, and other points of view gave their views, and now we have received a very luminous and exhaustive answer to all the criticism from the author of the original paper. Mr. Manville has devoted time and thought to the matter, and we regret that pressure on our space prevents more than the publication of a part of his reply in our columns. The suggestion he makes that the motor-'bus may have to bear some of the cost of road construction sounds novel from the motorists' side of the case, but is, perhaps, perfectly natural to one who has had wide experience in tramway matters. Summing up the whole matter, Mr. Manville believes that both motor-'bus and tramway has its own field, and that only in few cases will the conditions be such that it will be difficult to decide which system is the more applicable. Where ill-advised competition should unfortunately arise, the public on the one hand and the shareholders on the other will decide on the survival of the fittest, and he suggests that no amount of academical argument will alter this, the practical issue.

### Railway Enterprise.

THE London and North Western Railway Company have commenced running a service of motor-omnibuses between Watford Station and Croxley Green, a large village situated three miles from Watford, which has hitherto had no means of railway communication. With the new hourly motor-omnibus service, Croxley Green is brought within 55 minutes of London, by way of Watford Junction Station on the company's main line, and the inhabitants have not been backward in taking advantage of the new facilities. The omnibuses, after running through Watford Market Place and Harwoods Estate, reach the Rickmansworth road at the golf club, situated in Cassiobury Park, the beautiful estate belonging to the Earl of Essex, where

members are set down ten minutes after leaving the station. The vehicles then skirt Cassiobury Park until the Grand Junction Canal is crossed, where the road turns westwards, and after another mile of fine open country they reach Croxley Green Church in little over twenty minutes from the start. The company will shortly inaugurate another motor-omnibus service between Watford and Harrow and Wealdstone Stations, by way of Bushey Heath, and for this purpose some powerful motors are being constructed, to negotiate the severe hills between Bushey Station and the Heath, some of which are as steep as 1 in 12.

#### Cardiff and its Motor-Wagons.

THE experience of the borough of Cardiff with regard to scavenging by motor vehicles as a substitute for horses has been much commented upon, and some reference to the actual facts of the case may be useful as well as of general interest. The Corporation has had four motor vehicles at work, and from the discussion at the last meeting it was evident that the authorities were scarcely satisfied with regard to the higher

#### Short Sightedness in Douglas.

FORTUNATELY the object of the A.C.G.B.I. in holding its Reliability Trials in Manxland was not to convert the local authorities to incline favourably towards automobilism. Had such been the aim of the annual incursions into the island we should have had to write of "Love's Labour Lost." Knowing of the education in motoring that the people have had, and being certain of the popularity that motor-cars would enjoy with visitors, two owners of such vehicles have made applications to ply for hire at Douglas during the season. But, alas! the Town Council has rejected the proposal, and only one councillor seems to have shown sufficient enlightenment to have declared in favour of the idea. It is to be hoped his action will not cost him his seat at the next election; but doubtless local influences have been at work, and the whip of the Jehu had been flung—metaphorically, of course—around the Council Chamber, rendering all willing to prevent the admittance of a new rival. There is no doubt that the institution of a motor-car service in the Isle of Man would prove an advantage to the northern part

The A.C.F.'s Odotachymetre Competition. The competing cars with the speed indicating and mileage recording instruments starting on the 100-kilometre Road Test. (See page 262.)

cost of the motor scavenging as compared with the older style. In the end the city engineer was directed to make minute inquiries as to the methods adopted in other towns where such vehicles were in use, and make an exhaustive report to the Council.

#### The Royal Commission.

DOUBTLESS the fact that the Motor Car Commission has not yet reported has influenced the Local Government Board in its replies to the suggestions of the Roads Improvement Association. It provided the President of the Board with a reason for delaying adequate answers to questions relating to automobilism which were propounded in the House on Tuesday. We would suggest that those interested in furthering the cause of motorism in Parliament should now direct their interrogations with a view to hastening the publication of the Report. All semblance of hasty legislation must be avoided by opportunity for careful consideration of the proposals by those directly concerned before they are embodied in a Bill.

#### A Luxury for the Rich?

of the island and spread prosperity over the whole area. Surely a *modus vivendi* can be arranged, and if the hired motor-car is not to prowl about the promenades it might be allowed to carry visitors to those northern districts which, at present, are but a name to many who seek recreation in Mona.

FROM St. Albans has gone forth a communication to all the District Councils of the country setting forth the disadvantages of dust and advocating the development of a great national movement for its abolition. More than that, those who watch the fortunes of the Hertfordshire town would like to gather in more revenue from the hapless motorist in order to provide him with a well-watered surface. This decision is now being discussed with much heat and, in some cases, reason in many parts of the country. Away in Cumberland the Countess of Carlisle, whose son represents the district in Parliament, has been discussing the matter with the members of the Brampton District Council, and suggesting that a heavy

tax should be imposed upon motorists, "as motoring is a pure luxury at present." We do not know whether the Countess will be disposed to regard us as ungallant, but, despite her well-emphasised views on this point, we must be allowed the privilege of differing from her ladyship.

#### The Man of Moderate Means.

MOTORING may be regarded as a luxury for the rich, but it is also a delightful recreation for the middle-class man and the small trader. The ownership of big cars that seem to devour police traps in their course, leaving only the smaller ones to be engulfed in the machinations of the police, is, of course, only possible to a wealthy person; but the majority of vehicles seen upon the roads belong to people who do not disown the description of "men of moderate means." The professional man engrossed in his work all the week finds a motoring week-end the best tonic that any physician can prescribe, and the trader rejoices in early closing and steady motoring as a happy combination for which St. Lubbock and the Petrol Engine may be jointly thanked. More than that, despite the despondent utterances of a company chairman, the minor form of automobilism, the motor-bicycle, has its devotees, as the roads of all our town suburbs testify any Saturday or Sunday. However accurate may be her opinions on other matters, the Countess of Carlisle must be regarded as speaking tangentially from the truth when alluding to motoring as but a luxury of the rich.

#### Pioneer Workers.

THE retirement of Mr. S. R. Rhodes from the honorary secretaryship of the Wolverhampton Automobile Club brings to mind the services that have been and are being rendered to the motor-car movement by scores of earnest workers throughout the country. There is no doubt that the present proud position of motoring is due in a great measure to the provincial and other organisations that have allayed prejudice and disarmed opponents in influential circles. The honorary officers of such clubs have given splendid service, and can be assured of the value of their work in many ways. The case of Mr. Rhodes is illustrative of several instances that might be given of untiring devotion to the work. He convened the first meeting of the Wolverhampton Club, and not until considerations of health make his resignation imperative has he ceased to promote its prosperity and extend the influence of the automobile movement in his locality. Such men as Mr. Rhodes must be acclaimed as among the best friends of automobilism, and when the motor-car becomes universal their pioneer labours should be gratefully remembered.

#### Sense at Scarborough.

THE whole is wiser than the part is sufficiently akin to Euclid's wording to pass muster in the present age. Certainly the statement is true of the Corporation of Scarborough, which has been considering a proposal on the part of its Watch Committee that application should be made to the Local Government Board for a regulation limiting the speed of motor vehicles in the town to ten miles an hour. This was decided by the Watch Committee on Monday afternoon, but in the evening the Town Council met and rejected the recommendation, apparently recognising the fact that such restriction was not calculated to be in the interest of the townspeople.

#### The Police Inquiry.

WHEN it was announced that a Royal Commission was to inquire into the subject of policemanism, we had hoped the strange methods of combined truth and dubiety which flourish among some county constabulary forces would have formed a section of the investigation. The Automobile Association would have been able to furnish some interesting evidence

on that point, and have convinced the Legislature that the doings of the rural police with regard to motorists are often more atrocious than some of the allegations which have been made against one division of the Metropolitan force.

#### In the Thames Valley.

To those motorists who would explore the beauties of the Thames Valley Maidenhead presents many points of vantage. The great Bath road runs through the town and forms its main street, while the recent freeing of Maidenhead Bridge from tolls is a matter of interest and economy. This is situated at the eastern entrance to the town, and close by is Brunel's famous railway bridge, which spans the river by means of two brick arches. Maidenhead is the centre of beautiful scenery of no ordinary character, Cliveden, Marlow, Dropmore, Burnham, Windsor, Stoke Poges, Chalfont St. Giles, and Bisham Abbey being all within easy return. The town is also happy in the assistance to its prosperity given by a Chamber of Commerce, which keeps a watchful eye on the way the local authorities look after the roads and generally seeks the welfare of the district.

#### Water instead of Reason.

SOME idea of the false notions prevailing in some circles with regard to the dust problem was indicated at the last meeting of the Romford District Council, when a resolution was adopted to the effect that "all motor-vehicles should be in some measure further taxed, and that a grant from the revenue so derived should be made towards the expenses of watering the roads in every district used by motor-cars." This is folly indeed. Firstly, further taxation would bear heavily upon a class of people who are already sufficiently burdened in that direction; and, secondly, the watering of roads is but a temporary expedient that only the water companies would appreciate. We must go to the bottom of the matter, and that means looking after the foundation rather than wetting the surface.

THE WILBURY STABLES COMPANY, LTD., who are proprietors of the Eaton Riding School at Hove, also own a motor garage.

"MESSRS. JAMES BEACH AND SONS, M.D.'s (Motor Dealers)" is the form of announcement by which one of the leading motor firms in Taunton keep their name before the local public.

THE METALLIC MANUFACTURING CO., LTD., Ardrossan, N.B., have sent us a sample of their Halax copper asbestos washers, which are made in various sizes for use on motor-cars.

MESSRS. J. GREEN AND CO., motor engineers, of Loughton, have opened a depot at High Road, Woodford. In addition to a large motor garage, the firm will carry a large stock of accessories, tyres, petrol, etc.

THE Automobile Association patrols are now attending special classes of instruction in tyre repairs by courtesy of Messrs. Harvey Frost and Co., the Continental Tyre Company, and Messrs. R. and J. Pullman.

MESSRS. KELL AND DE LOTZ, of East Street, Farnham, have issued a handy card of mems. for motorists which, in addition to the index marks for England and Wales, gives a table of distances from Farnham.

MESSRS. RICHARD BURCH AND SONS have opened a garage in the High Street, Dawlish. This, with their works at the West End of the town, will give them accommodation for about thirty more cars. The place will be available to motorists at all hours of the day and night.

FROM Messrs. Hutton, Sons and Co., of Summer Hill, Dublin, comes a copy of an interesting pamphlet they have lately issued, entitled "Notes on Motoring Troubles," which contains a number of useful hints for motorists. The end of the booklet is devoted to a description of the various cars which the firm represent, including the White, the Daimler, the Wolseley, the Siddeley, and the Darracq.

## MOTOR-CARS AND THE EARTHQUAKE.

**L**AST week we gave a brief chronicle of some of the unwonted happenings in the saddened city of San Francisco, and made reference to the splendid rescue work which was only possible by the help of the automobile. Now we are able to furnish some illustrations, which depict more forcibly than pen can tell the ravages wrought by the earthquake as well as by the fire by which it was followed.

Three hours after the great shock the city was under martial law. Every automobile appearing on the street, whether in

One of the first garages to be destroyed was that of the Pope-Toledo Agency, then that of the Cadillac, and then the White depot. The White people seemed to realise from the very first that the thing to do was to get their machines to a place of safety, although the fire originally started many streets away. A spot in Golden Gate Park was selected, and the cars were rapidly run out there and a watch put on them. Machines which were not in running condition were towed out.

Mr. Walter C. White, who is known in motoring circles on both sides of the Atlantic, was in Los Angeles on his way home to Cleveland from the city of Mexico, when news of the earth-

Inspecting the Ruins at San Francisco.

charge of the owner or some one else, was accosted by a soldier and put in the service of the militia. The name of the owner, the name of the car, the number of the vehicle, and the hour of the day was written down, and a duplicate copy given to the owner or driver. The machines were in no way spared, often being run without tyres during the four days of the fire. Rubber tyres could not stand the hot streets and pavements that many of the cars travelled, and they collapsed, never to be replaced until the car went out of commission. The principal use of the automobiles was in hurrying doctors and nurses to the injured and carrying explosives to blow up the buildings.

quake reached him. He determined to go to San Francisco, a distance of 475 miles, on his steam car. It proved a trying task—the roads were cumbered with telegraph poles and trees, bridges were lying in ruins, and great fissures in the roads—such as are seen in our illustration of what was previously the main roadway through Golden Gate Park—obstructed the travellers. On reaching the city limits the car was commandeered, Mr. White volunteered as driver, and was ordered to the Mechanics' Pavilion, where he met Mr. C. A. Hawkins, the local manager of his company, and together they rendered valuable aid to the authorities.

## THE ITALIAN COPPA D'ORO TOURING CONTEST.

WHAT is by far the most important and difficult competition of touring cars which has so far been organised is that which is at present being held in Italy under the auspices of the Automobile Club of Milan. The trial will last for eleven days, the total distance to be covered amounting to no less than 2,420 miles, divided into eleven daily stages, as follows:—

May 14.	Milan, Brescia, Verona, Padua, Bologna ...	432.7 kil.
" 15.	Bologna, Arezzo, Perugia, Rome ...	451.8 "
" 16.	Rome, Capua, Naples ...	245.7 "
" 17.	Naples, Frosinone, Rome ...	227 "
" 18.	Rome, Viterbo, Arezzo, Florence ...	371.5 "
" 19.	Florence, Pistoia, Modena, Genoa ...	436.4 "
" 20.	Genoa, Parma, Turin ...	448.2 "
" 21.	Turin, Arona, Novara, Milan ...	226.9 "
" 22.	Milan, Verona, Udine ...	468.8 "
" 23.	Udine, Vicenza, Brescia ...	403.6 "
" 24.	Brescia, Cremona, Milan ...	158.2 "

will prove quite as much a trial of the hill-climbing capabilities of the cars and their brake-power as of their speed qualities. The course crosses the Alps several times, and on five different days the cars have to ascend from the plains to altitudes of between 6,000 ft. and 7,000 ft. The daily runs have been divided into a number of controls between which minimum and maximum speeds of 18½ and 25 miles per hour are required. Any competitor who completes a stage in more than fifteen minutes under the time allowed will be disqualified.

The winner of the event will be the competitor whose average speed over the whole course is the closest to the maximum fixed, while in the case of a tie as regards average the award will be made to the least costly chassis. The first prize consists of the Coppa d'Oro, or the Gold Cup, which is worth no less than £800, and a cash prize of £1,000. A gold plaque and £240 in cash will go to the second car; the third will receive £200, while £188 will be distributed amongst the next five. There is also a prize of £280 to whatever team of cars of the same make achieves the best performance, while £200 will be

Profile of the Route to be covered in the Italian Coppa d'Oro Touring Competition. The distances are on a scale of 1 to 2,500,000, and the altitudes 1 to 25,000.

The majority of the cars taking part in the event are of Italian construction, they numbering thirty-five out of the fifty-two entries, and consisting of eight Diatto-Clements, five Isotta-Fraschinis, three each Itala, Züst, Fiat, Rapid, and Marchand, two Florentia cars, a Bianchi, an Otav, and a S.A.L. Great Britain is represented by four cars—a Daimler, driven by Mr. A. D. Grigg, a Leader (Mr. Shaw), and two Napiers (Macdonald and Glentworth). The French competitors include one each Peugeot, Aries, La Buire, and Krieger, and three Dions. The German cars in the event comprise two Mercedes and three Benz, and three Martinis are upholding the credit of the Swiss motor industry.

The severity of the task can be judged from the fact that while the average daily distance is 220 miles, the journey to be made on six of the days extends to close upon 300 miles. From the accompanying profile of the route, for which we are indebted to "La France Automobile," it will be seen that the competition

gained by the most successful amateur driver who has not competed in 1905 or 1906. The King of Italy's prize will also be awarded on the same conditions, while there is a long list of smaller prizes too numerous to mention.

The start took place at 4.30 a.m. on Monday last, but the cars, which were sent off at two minutes intervals, began to take their places in the line at 3 a.m., so that there was little or no sleep for the competitors, passengers and officials on Sunday night. A ballot had been held for the order of starting, which resulted in the first two places falling to the lot of British competitors, Mr. Grigg, on a Daimler, heading the list, with Macdonald (Napier) second.

Out of the fifty-two entries forty-eight actually started, the absentees being the Leader, the S.A.L., the Krieger and the La Buire. At Lodi the Daimler, which started first, still held the premier place. Raggio was delayed three-quarters of an hour in repairing the petrol tank of his Marchand car, while

Verutto, who was driving the Rapid, No. 40, gave up owing to a burst cylinder. Macdonald (Napier) was the first to reach Verona, followed by Cagno on an Itala. The Daimler car was reported to have met with an accident near this place. Three competitors retired at Padua—No. 37, Conti on a Zust, No. 38, San Donnino on a Marchand, and No. 3, Campana on a Peugeot. The causes are not yet known. The last part of the journey from Padua to Bologna was notable for the large number of sharp corners which had to be negotiated, but no accidents are recorded. Out of 48 starters 41 successfully completed the journey, the missing ones other than those already referred to being a Rapid, a Mercedes and a Diatto-Clement. On Tuesday the run was from Bologna to Rome, a distance of over 280 miles, where the King of Italy personally welcomed the travellers.

### THE ZUST PETROL CARS.

**S**TILL another addition has to be made to the already long list of Italian-built petrol cars on the English market. We refer to the Zust vehicles, which are made at Intra, on the shore of Lake Maggiore, and at Milan, and the British agency for which has just been acquired by the Farman Automobile Company, Ltd., of Long Acre, London, W.C. The cars are being made in two sizes—50-h.p. and 28-h.p. We give a view of the chassis of the latter in the accompanying illustration, from which it will be seen that, generally speaking, the design follows lines adopted in the well-known Mercedes vehicles. As the first of the Zust chassis is not expected for a few weeks, we defer a full description to a later occasion, but in the meantime may briefly mention that the motive power is supplied by a four-cylinder engine having all the valves operated off a single cam shaft, which, like the one operating the low-tension magneto ignition, runs on ball bearings. A special form of automatic carburettor furnishes the mixture, while the power of the engine is transmitted through a disc clutch to a gear-box giving four speeds and a reverse, with direct drive on top speed. From the differential shaft side chains convey the power to the rear road wheels. Ball bearings of the D.W.F. type are used on the road wheels and in the gear-box. The Zust cars enjoy an excellent reputation in Italy, their design and

Chassis of Zust 28-h.p. Car.

construction ranking them among the high-grade automobile productions of the country.

THE new Arrol-Johnston Motor Car Company, Ltd., have just completed a handsome 12-15-h.p. landaulet for Mr. C. W. Fulton, of Paisley.

THE Premier Motor Company, Cornwall Street, Birmingham, the British agents for the Marchand car, have now installed one of their workshops with up-to-date machinery, and are open to do all kinds of repairs.

### A RUN ON A SIZAIRE-NAUDIN CAR.

**W**E had an opportunity a few days ago of making a short trial run on one of the Sizaire-Naudin 8-h.p. two-seated cars, the British agency for which has been secured by Messrs. T. J. Harman and Co. The little vehicle comprises quite a number of special features, and formed one of the attractions at the last Paris Salon and also at the recent Cordingley Show. A fairly complete description of the car, together with illustrations, was given in the *M.C.J.* of December 16th last, but we may mention that not only is the frame and suspension on novel lines, but

The Sizaire-Naudin 8-h.p. Car.

that the transmission is also of a special design, the ordinary gear-box being dispensed with, and the three speeds forward and a reverse obtained by peculiarly-shaped pinions on the end of the cardan shaft. Other noteworthy characteristics of the car are the ignition, which is automatically advanced and retarded by means of a centrifugal governor, and the clutch, the latter simply consisting of a flat disc which is pressed close up to and against the inner face of the flywheel. Coming now to the trial run, the route was along Regent Street, W., the car wending its way through the thick traffic without the slightest difficulty. Once on a clear road a good speed was quickly attained, and although the easy springing of the frame gave us at first a somewhat new sensation, yet this quickly passed away, and the easy riding qualities enforced themselves upon us. On the way home the ascent of the steep gradient known as Netherall Gardens, N.W., which has become by common consent the testing ground in the London area, was included in the journey. Although the little car easily climbed the hill, Mr. Littlejohn, who was at the wheel, was, however, not altogether satisfied, so, after a slight adjustment of the trembler, a second trial was indulged in. On this occasion not only did the car run up in excellent style but we stopped and started on the steepest part of the gradient, the "pulling" powers of the engine and the efficiency of the clutch being thus well demonstrated. The car is exceedingly simple to manage, the number of levers and pedals being reduced to a minimum. Apart from the usual change-speed lever and hand brake there is only one pedal, which controls both the clutch and the foot brake, and one lever on the steering wheel, this regulating the speed of the engine by means of a variable lift to the inlet valve. The customary ignition lever is dispensed with by reason of the automatic advance and retard already alluded to, and which appears to give very satisfactory results in practice, no tendency to "knocking" being discernible in the course of the run. Altogether, our experience of the Sizaire-Naudin, although a short one, gave us a good opinion of the little vehicle, and, in view of its relatively low price, we are not surprised to learn from Messrs. Harman that it is meeting with favour at the hands of a large number of motorists of moderate means.

## SOME CURRENT TOPICS.

### The Arrival of a New Car.

The arrival of a new car is generally a long-expected and frequently much-delayed event, occasioning a thrill of excitement in the bosom of even the veteran motorist, which with the tyro is often accompanied by an amount of anxiety regarding the new-comer's constitution and treatment, not inaptly comparable with that of a mother on the advent of her "first." It is unlikely in these days that an absolute novice will receive his car without the opportunity for practical instruction of some kind, as many did in the early days of the movement, and this should be followed—if not, as it should be, accompanied—by a careful study of the use and function of every part of the mechanism. Where the owner is already familiar with some other type of car, special note should be taken of any important differences in the driving arrangements, as the general tendency to more or less uniformity in these makes small discrepancies more puzzling. Special note should be taken of the position of every lubricator, grease-cup, and other oiling arrangements,

tank and see that the cock at the bottom of the water system is closed. Fill all grease-boxes, if present, see that axle-boxes are lubricated, and that the gear-box and differential case are plentifully supplied with lubricant. For this a thin grease, or mixture of grease and oil, is best; if too thick, the gear wheels cut a track in it without oiling themselves. The addition of a few ounces of good graphite is beneficial in most cases. Fill all drip or other lubricators with a good motor oil, not too thick to travel along the pipes, and see that the crank-case of the motor has its charge of the same, and that the steering-pivots are also attended to. The tyres should always be pumped up hard. It is presumed that the car has been registered, and that the necessary driving and excise licence has already been obtained, as no one may start on their motoring career before these requirements have been satisfied.

### Picnicing in Surrey.

Quite a number of London motorists have discovered the fact that one of the pleasantest spots in Surrey for a motor picnic is on the summit of Boxhill, near Dorking, whence spreads out a most magnificent panorama. We visited the spot last week-end, and found eight or nine cars had already arrived before us, some of their passengers enjoying the beautiful view, others a ramble through the woods, and a few a siesta on the grassy banks. Boxhill can be reached *via* Epsom, Leatherhead,

The Targa Florio Race. On the Road between Buonfornella and Cerda.

remembering that each working part must be supplied with lubricant from somewhere.

### See to the Lubrication.

The chief attention a new car requires is in the matter of lubrication, which should be free and plentiful, with due consideration for the troubles induced by excessive supply to the cylinder. This usually causes rapid fouling of ignition points; but a new cylinder generally lets more oil past the piston at first than after a little running, so the supply should not be cut down too much from this symptom unless persistent. All important nuts and bolts should be scrutinised for looseness after a run, especially those supporting detached parts of the mechanism, such as the silencer, carburettor, piping, pump, etc., not, of course, omitting those of the steering gear and brakes. It is not always superfluous to verify the freedom of petrol, water, and lubricating oil pipes from obstructions arising from dirt or waste left in the tanks.

### Preparing for a Run.

The novice may find the following *resumé* of operations useful in the starting of his car, it being impossible, of course, to include variations necessary with some types. First, fill the petrol tank, using a funnel with a strainer. Next, fill water

and Burford Bridge, but in this case the car had better be left at the latter place, as the ascent is by a steep zigzag road. The best way to go with the car to the top of Boxhill is *via* Sutton, Banstead Downs, and Burgh Heath. A mile or so from the latter place there is a fork in the road, the left leading to Reigate, and the right—the one to be taken—to Boxhill. After a run of about three miles across the open common land a very dangerous corner has to be negotiated at Pebble Coombe. The road to be taken bears sharply to the right and then to the left. A triangular danger signal has been erected near the spot, and the motorist who makes the run will be well advised to slow up and have his car well in hand as soon as he reaches the warning post. The way continues for a mile or so along an undulating but ever-rising road until, after a bend to the right, the beautiful scene which opens out on the left indicates to the traveller he has arrived at his destination. The return home may be made *via* the zigzag road already alluded to, and thence *via* Leatherhead and Epsom. The descent of the hill is, however, rather trying, and we prefer to journey back by the same route as that followed in the outward trip, introducing a change at Burgh Heath by taking at that point the Ewell road, and on *via* Cheam and Morden. The distance out and home is, roundly, fifty miles.

## THE RACE FOR THE GRAND PRIX DE L'A.C.F.

Every effort is being made to make the villagers acquainted with the importance of this event, not only from the point of view of sport, but also as to its benefit to the Sarthe district. Cinematograph Entertainments are being given in all the principal places on the Circuit, and where no suitable building is available, an open-air address is, as the above illustration shows, substituted. [*Allgemeine Automobil Zeitung*.]

THERE are fifteen motor-cars plying for hire at Southport. PRINCE FREDERICK LEOPOLD of Prussia has just ordered a 40-h.p. Benz car.

THE Royal Hotel at Winchester is now fully modernised by the addition of a motor garage, where petrol, lubricating oils, etc., are stored.

MR. BEERBOHM TREE has placed an order with Messrs. Donne and Willans, Ltd., for a 30-35-h.p. Rochet-Schneider car fitted with a landaulet body.

THE REV. R. GRIFFITHS, chaplain to the Medway branch of the Missions to Seamen, has ordered from the Burnham Motor and Boat Company, Limited, a 17ft. carvel built open launch, fitted with a 5-h.p. "Truscott" motor, for use as mission tender, and to give greater facilities for boarding vessels in bad weather and against strong tides.

THE Great Western Railway Company has put into light goods service in London an electrical wagon of 2-tons capacity.

THE County Council of Wigtown is making application for the restriction of the speed of motor-cars on some of its roads to ten miles an hour.

THE Engineering Section of the London Chamber of Commerce is bringing the subject of highway administration to the notice of various important associations.

THE congregation of one of the churches in Dundee is about to consider an offer made by a motor-car company to purchase the building, with a view to its conversion to a motor garage.

IN consequence of the motor-car fatality at the Cobham cross roads on Good Friday, the Surrey County Council have given instructions for the erection of four danger symbols at the respective approaches.

## CONTINENTAL NOTES.

### The Rhone Touring Competition.

The Automobile Club du Rhone is organising a competition of touring cars for July next. The event will commence on the 12th by a run from Lyons to Vals-les-Bains *via* Duerne and Le Puy, a distance of 250 kilometres, while on the 13th a circular trip from Vals to Mayres and Bleymond and back, 270 kilometres, will form the programme. On July 14th there will be a 16-kilometre contest on the Escrinet Hill.

### The Italian Motor Car Industry.

La Societa Officine de Luca Daimler per Costruzione Meccaniche Automobili is the title of a company which has just been formed in Naples with a capital of £130,000 to build motor-cars under licence from the English Daimler Company.

### The Tour of France Competition.

Owing to the labour troubles in the French automobile industry, and the inability of many of the competitors to complete their machines in time, it has been decided to postpone the

### Public Services in France.

A public motor-car service has lately been inaugurated between Villiers-sur-Marne and Plessis-Trevisse. Similar connections are also shortly to be started between Vauvois and Baigneux (Cote d'Or), and between Beaune and Nolay.

### The Labour Troubles in the French Motor Industry.

The motor-car industry in France continues at a standstill. At a meeting of the employers last week it was unanimously decided not to agree to the men's demand for a reduction in the daily hours of working from nine to eight, and for the "English week" of fifty-four hours with pay for sixty hours and a half-holiday on Saturday. A deputation also waited on the Minister of the Interior with regard to the protection of the factories by the military authorities. On Monday posters were put up in the towns of Suresnes and Puteaux announcing that the works would be opened on Tuesday morning at eight, when those workmen who were so inclined could restart on the old terms. In order that no disturbance should take place the Minister of the Interior had drafted a large number of soldiers into the district. As we go to press we learn that the number of men who went in on Tuesday was in some cases satisfactory, but in

The Targa Florio Race. A View of the Grand Stands at the Starting and Finishing Point.

start of the contest known as the "Tour of France," for motor-cycles and voiturettes, from the 12th to the 22nd inst.

### The Odotachymetre Competition.

Twelve entries were received for the French Automobile Club's competition of speed-indicating and distance-recording instruments, as follows:—

- |                               |                               |
|-------------------------------|-------------------------------|
| 1. Glaenger et Perreaud.      | 7. Deutsche Tachometer Werke. |
| 2. Jacquemier.                | 8. Auzout.                    |
| 3. Junghans.                  | 9. Delasalle.                 |
| 4. Cowey Engineering Company. | 10. Jules Richard.            |
| 5. Cowey Engineering Company. | 11. H. Bieh.                  |
| 6. Otto Schulz.               | 12. Krauss.                   |

The instruments were first subjected to careful inspection and test at the A.C.F. laboratory, and on Thursday last week were submitted to a 100-kilometre trial on the Montgeron-Ozoir-la-Ferriere road, they having been fitted to cars of not less than 15-h.p. for that purpose. All but one took part in the run, the absentee being the Junghans, the car to which it was attached having been deranged in course of transit by rail from Germany. The judges are now preparing a report and the awards will be made in due course.

other instances not more than 10 per cent. of the staff came back. According to one estimate no less than 25,000 men connected with one branch or another of the motor industry are on strike. As a result of the troubles it is reported that two firms of motor-car builders have decided to transfer their works to other countries—one to England and one to Italy.

### Public Services in Switzerland.

A company has just been formed at Stein, in the Canton of Schaffhausen, to establish a public motor-car service between Waldstatt, Hundwil, Stein and St. Gallen.

### Miscellaneous Items.

The Touring Committee of the A.C.F. is organising a motor-car lamp competition and also one for devices to prevent the emission of smoke by automobiles.—Owing to the disturbance to production caused by the labour troubles in France the organisers of the competition of voiturettes for the Hydra Cup have decided to postpone the event until next year.—The municipal authorities of Goes, Holland, are reported to be in the market for a motor fire engine.—The German Reichstag has adopted the Bill imposing taxes on motor-cars.

THE L. and N.W.R. have had a special form of van constructed to deal with their increasing traffic in motor-cars.

THE Maidens and Dunure Railway was opened for traffic on Thursday, and the Turnberry Station Hotel of the Glasgow and South Western Railway was also made ready for the reception of visitors.

THE Rajah Muda, of Sarawak, has just taken delivery of a 10-12-h.p. car from Argylls, London, Ltd., and he is now driving the vehicle himself.

MESSRS. JARROTT AND LETTS, LTD., have just delivered a 22-28-h.p. Crossley car to the Earl of Crewe. It is fitted with a handsome limousine body to seat seven persons.

In the Nilgherry (India) hill-climbing trials recently held Major Babbington won the cup on a 7-h.p. Swift. His car was the same vehicle that distinguished itself in the 1904 Light Car Trials.

WE understand that the following leading hotels of Plymouth have agreed to give free garage accommodation to motorists staying thereat, viz., the Royal, the Grand, Chubb's, the Albion, the Continental, and Farley's hotels.

At a meeting of the Council of the Cyclists' Touring Club, held in Edinburgh on Saturday, it was announced that 12,726 members had exercised their right to vote upon the question, "Are you in favour of steps being taken to broaden the basis of the club, so as to admit all tourists to membership?" and that the result showed 10,495 in favour and 2,231 against.

DURING the storm in the Peak district last week, Mr. R. J. Kerr, of Chapel-en-le-Frith, was returning home in his motor-car when it stuck fast in a deep cutting full of water across the roadway, and the occupants narrowly escaped. Horses were subsequently attached to the vehicle, and the party were conveyed home.

THE Hastings and St. Leonards Motor-Car Company, Ltd., has been formed with headquarters at 289, London Road, Hastings, to carry on business as carriers of passengers and goods. An interesting programme of trips has been arranged, and Messrs. E. C. Eldridge and A. Hart, the managing directors, are hopeful as to the success of their enterprise.

BRIGHTON TOWN COUNCIL, at a special meeting, have decided, by twenty-four to fifteen votes, to appeal against a decision recently given by three judges in a divisional court, declaring illegal a payment of £3,000 for laying with tarmac the undercliff used for the motor speed trials last year on the ground that the work was done before it was necessary.

VISITORS to the Burford Bridge Hotel, near Dorking, on Sunday, were much impressed by the valuable assistance which the motor-car is able to render in a case of accident. A Mr. Hodson and his wife were climbing over the precipitous slopes of Box Hill, when by some mischance the former missed his footing and fell a distance of some 50 feet, sustaining a compound fracture of the left arm. A passing motorist conveyed Mr. Hodson to the hotel at the foot of the hill, but, there being no surgeon nearer than Dorking, and no other vehicle available, his friends despaired of securing medical aid before Mr. Hodson became exhausted through pain and loss of blood. Fortunately, however, Mr. H. Gutteridge drove up to the door on his Peugeot car, and took Mr. Hodson into Dorking, where first aid was administered. Mr. Gutteridge subsequently drove Mr. Hodson to the station, and saw him safely on his way to his home in town, where he is progressing quite satisfactorily.

## HERE AND THERE.

THE directors of Messrs. J. I. Thornycroft and Co., in their report to be submitted to the meeting on Tuesday next, refer to the expenses in the experimental work in connection with motor-buses, and express

the belief that, as a result, they have produced a satisfactory vehicle.

MR. A. C. MACLAREN, the captain of the Lancashire cricket team, has been presented with a 10-12-h.p. Humber motor-car by admirers of his prowess in the cricket field.

On the order for the second reading of the Mersey Railway Bill in the House of Commons on Tuesday, an instruction was moved in opposition to the granting to railway companies of power to run motor-omnibuses in competition with local authorities.

THE Home Secretary has informed Mr. Weir, M.P., that in the Metropolitan area during April of last year the number of accidents caused by motor-cars, including motor-cycles, was 433, of which 134 resulted in personal injuries and nine proved fatal. In the same month 424 accidents were caused by motor-omnibuses, seventy-six resulting in personal injuries and three proving fatal.

THERE has just been completed, at Messrs. Spencer's works at Highbury, a balloon de luxe to the order of Messrs. Leslie and Ernest Bucknall. This aerial craft is named the "Enchantress." The gas vessel itself is a sphere of 50,000 cubic feet capacity, made of 360 panels of silken material, sewn together in brick fashion, for strength. The first trial took place on Monday from Wandsworth to Littlehampton, the greatest altitude attained being 8,000 ft.

THE deflation of a balloon at Stagsden, a village midway between Newport Pagnell and Bedford, on Monday, was attended by a serious explosion, which resulted in seven persons being so seriously injured that they had to be removed to the Bedford County Hospital.

The descent was successfully made, but while the balloon was being emptied of its gas an explosion occurred. It is surmised that one of the onlookers, in lighting his pipe, must have caused the explosion, a pipe and a box of matches being subsequently found in proximity to the balloon.

A NEW garage has been opened at Lincoln by Messrs. R. M. Wright and Co. It stands on an area of a little over 1,000 square yards, and will have accommodation for fifty cars. It is near Messrs. Wright's present depot, in the centre of the city, has roads on two sides, and is close to the Witham, which makes it very convenient for motor-boats. Mr. Wright, who has had a great deal of motoring experience, has not lost sight of the minor details, and is to be congratulated on having such an up-to-date garage.

CAPTAIN DEASY, on a 20-24-h.p. Martini, has ascended Balloch Hill, between Lochcarron and Applecross, on the western borders of Ross-shire, carrying six passengers and luggage together with surveying instruments and complete bioscope outfit. The ascent, which was made from the shore of Loch Kishorn, is one of 2,250 feet in six miles. The average gradient is 1 in 10, but there are severer gradients of 1 in 7 and 1 in 5 with dangerous turns. The complete climb occupied just 36 min. Previously in Argyllshire the party ascended the precipitous hill at the head of Loch Striven, a gradient of 1 in 3½, and other steep inclines leading to Otter Ferry and Loch Fyneside.

The Standard 30-h.p. Six-Cylinder Car built for Mr. F. E. Swann.

ABOUT eighty firms were represented at the automobile exhibition recently held at Montreal.

ACCUMULATORS can be charged at Mr. L. L. Sharland's, Winton Motor Works, Jewry Street, Winchester.

MESSRS. J. KEELE AND CO. have recently supplied a 20-28-h.p. Spyker car to Mr. Max Pemberton, the well-known author.

THE Nizam of Hyderabad has placed an order with the Daimler Motor Company, Ltd., for one of their cars for State purposes.

ONE of the most completely equipped motor establishments in Northern Britain is the Arcade Motor Garage, 431, Union Street, Aberdeen.

TROUBLE is said to be brewing among the Vanguard motor-car drivers with the management of that concern with regard to the conditions of service.

DECORATED motor-cars will figure largely in the reproduction of the Nice Carnival at the Crystal Palace on the 1st and 2nd prox. in aid of the Royal Waterloo Hospital.

To celebrate the opening of Mr. J. Fryer's new garage at Leominster, Mr. J. Harley Nott entertained the members of the Herefordshire Club to luncheon on Saturday. Mr. Fryer, whose motoring activities at Kington are well known in the Wye Valley, afterwards entertained the party, numbering about fifty members and their friends, to tea at the Feathers Hotel, Ludlow.

WE illustrate herewith a useful little novelty which has lately been put on the market by Messrs. Brown Bros., Ltd. It is known as the "Duco" Waistcoat Pocket Lamp, and it is intended for use in testing accumulators. By means of the arrangement adopted a good contact with the terminals can be

obtained; the device is well made, and is practically indestructible, and folds to fit the waistcoat pocket. The lamp is removable and is fitted with standard thread.

FROM the American Motor League of New York we have received a copy of a useful little book it has just issued for the use of its members under the title "Roadside Troubles." It explains in plain words the power used in driving motor vehicles, the nature of petrol, and how it should be used and stored—in fact, there is hardly a point in connection with motoring that is not dealt with in the twenty chapters comprised in the work.

THE guarantee of the Acme Rubber and Tyre Company, 343, St. Vincent Street, Glasgow, is in the following terms:—"We guarantee all repairs done originally by us for three calendar months from date of leaving our works, barring accidents and tyres run deflated." Motorists who send their tyres to be repaired by this well-equipped firm will have the satisfaction of knowing that no work is undertaken unless they have reasonable hope of its proving satisfactory in every way.

THE "Mascot" cars, which are made in three sizes—10-12-h.p. double-cylinder and 16-20-h.p. and 20-22-h.p. four-cylinder—and which were only introduced by the Farman Automobile Company, Ltd., towards the end of last year, have quickly become a popular type, as may be gauged from the fact that during a recent week orders were placed for no less than seven vehicles. Lieut.-Col. Coote, of Creaton, Northamptonshire, has ordered a 14-16-h.p.; Mr. Allan F. Joseph, of Cairo, a 16-20-h.p. with landaulet body; while 20-22-h.p. cars are being built for Mr. T. B. Burnham, East Grinstead; Mr. W. D. Stewart, Wallington; Mr. Alfred Naylor, Ware; Dr. Williams, Sherborne, Dorset; and Dr. Sydney Harvey, Queen's Gate, W.

THE Glasgow and Paris Motor Garage and Repairing Company, Ltd., has been registered in Scotland.

A FREE ALCOHOL BILL—so far as industrial purposes are concerned—is on its way through the Congress of the U.S.A.

THE Isle of Wight Central Railway Company has decided to introduce a railway motor-car service as an auxiliary to the present system.

MR. C. JARROTT says that the chains of the Coventry Chain Company, fitted to his 40-h.p. Crossley car which made the recent successful run to Monte Carlo, behaved admirably.

WE hear that some experiments are being made with a new preparation which increases the power of petrol. It is put up in small tubes, and only a few drops are added to the contents of the petrol tank.

MANY complaints are being made concerning the nuisance created by motor-omnibuses in the Fulham district. The neighbourhood particularly affected is Walham Green, where an extensive motor-omnibus depot is located.

THE South Wales Motor Garage Company, whose garage is in Park Street, Cardiff, have now a showroom in St. Mary's Street in the same town. Mr. Parker Thomas, who has driven in several A.C.G.B.I. trials, is the manager of the concern.

AT the annual meeting of Components, Ltd., Mr. Frederick Walker, referring to the trade of the year, said "the demand for motor-bicycles suddenly fell off and they had gone out of favour and out of fashion." And yet they may still be seen upon the road.

THE new price list of the Aston Motor Accessories Company, Ltd., of Birmingham, whose specialities for motor-cars are favourably known, contains drawings and descriptions of the Amac pump, radiator, plug, contact-maker, terminal clip, lubricators, and other devices of good design and finish.

THE motor industry is flourishing at Peterborough, and one large engineering firm recently established there is engaged on motor-bus work. Messrs. Thos. Brainsby and Sons, of Long Acre, W.C., and Peterborough, are also busy at their extensive works building motor-car bodies for many of the leading firms and notabilities. Altogether the motor industry gives employment to a large number of hands at Peterborough. The rates are low, five railways serve the city, and there is plenty of land available near the main lines. The prediction of Mr. G. C. W. Fitzwilliam that Peterborough would soon become one of the most prosperous towns in the Midlands is being realised.

FROM Mr. André A. Godin, of Red Lion Square, London, W.C., we have received a copy of the 1906 catalogue of Ducellier motor acetylene and paraffin lamps which he has just issued. Special prominence is given to the latest patterns of self-contained headlights with optical condensers. They are provided with a tap which cuts off the water supply at the same time as that of the gas, thus allowing the charging of a head light months before it is required to be used. Like other Ducellier head lights, they are worked with ordinary commercial carbide; their lighting power has been scientifically designed so that the lamps in question will project a light from 250 to 350 yards ahead. They contain a charge of carbide which will give a continuous light of over six hours if necessary, and recharging can be effected without emptying the water. Attention may also be drawn to the helmet-shaped and round projectors. The last-named model is not fitted with feet, crown, or a handle, and is therefore very easy to clean, besides giving it a smart appearance. After some useful information with regard to the method of using the lamps, space is devoted to particulars of the latest form of extensible and swivelling brackets for all sizes of acetylene head lamps. These brackets are fitted in pairs, and are connected to the steering rod by means of flexible cable, so that when steering the car the head lamps fitted on the swivelling brackets move together with the front wheels and at the same angle, thus allowing the light to be projected in the right direction when rounding a corner. The measurements of the brackets, taken from centre to centre, which each individual head lamp will fit, are also given, a feature which will doubtless prove very useful to intending purchasers. Altogether the new list is a well-compiled and artistic production.

## THE MURPHY PETROL GAUGE.

WE illustrate herewith a petrol depth gauge known as Murphy's, and intended to be fitted to the dashboard of motor-cars, which is being manufactured and put on the market by Messrs. Schaffer and Budenberg, Limited, Manchester. Fig. 2 gives a general view of the gauge, which can be fitted in any position—above, below, or on

Fig. 1.—Diagram of Connections.

a level with the petrol tank. The instrument can be easily fitted on any car without the necessity of removing or even emptying the petrol tank. There is merely a dip pipe F, as shown in Fig. 2, screwed into the top of the tank at G and dipping into the petrol to the bottom of the tank, and connected at K with the instrument on the dashboard by an air-line pipe. The dashboard instrument is itself charged with ordinary petroleum, i.e., paraffin oil, by unscrewing the filling plug D

Fig. 2.—General View of Indicator.

over the gauge glass and pouring in about half a wine-glassful. The petroleum will appear at the base of the gauge glass when sufficient has been added. To ascertain the amount of petrol in the tank the lever A at the side of the instrument (Fig. 2) is gently raised and then lowered to its lowest point. A quantity of air is thereby forced through the line tube E E (Fig. 1) and the dip pipe F out into the tank. This simple movement causes

a column of indicating liquid to rise in the gauge glass of the instrument to the exact height of the liquid being measured. One complete stroke of the lever is sufficient, each succeeding stroke merely producing a duplicate reading. For petrol tanks under pressure a second line tube is used to connect the second coupling on the petrol gauge with the top of the tank, as indicated in dotted lines in Fig. 1. This has the effect of equalising the pressure on the liquid in the tank and that on the indicating liquid in the gauge. When connected in this way the instrument, as before, shows the exact depth of the petrol in the tank, and is unaffected by whatever gaseous pressure may be present. The gauge can also be used in conjunction with water tanks, water then taking the place of petroleum in the instrument; it is a device which will be found useful in many ways. Thus, when starting out for a run, one can tell at a glance the amount of petrol which the tank contains, instead of having to go through the operation of removing the cushions, unscrewing the top of the tank, and measuring the height of the petrol by means of a stick or tube. When actually running, too, it is useful, for on approaching a town one can tell at once if it is advisable to stop and get in a fresh supply of spirit.

## A SUBSTITUTE FOR THE INSPECTION PIT.

WE illustrate herewith an ingenious yet simple motor platform which has been brought out by an American firm for use in garages where it is not possible to have an inspection pit. The illustrations show the platform so clearly that but little description is necessary; it may be pointed out, how-

Fig. 1.

Fig. 2.

ever, that one of its principal features lies in the fact that the car is raised on to the platform by its own power. It consists of a pair of stout parallel planks supported by an inverted trestle hinged to a base. At one end of each plank is a stationary leg extending below the planks and at the other end a swinging leg, which can be brought into line with the planks. When ready for use the jack is inclined, as shown in Fig. 1; when the car is slowly run up on it the platform falls forward of its own accord, the hinged legs being then turned under and fastened in position by a bolt (Fig. 2) to support the rear of the car. The device is one that motorists could readily have made for themselves by a local carpenter.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

### AN INGENIOUS BRACKET FOR HEAD LAMPS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I send you some photos of a new form of lamp bracket which I have recently designed for my Renault car, as I think that the device may possibly interest those of your readers who possess cars in which (like the Renault) the engine bonnet is hinged to the dashboard. With all cars of this type it is a matter of some difficulty to fix the vehicle's head lights so that the raising of the bonnet shall not be impeded; ordinary lamp "forks" bolted to, and near the extremities of, the front spring hangers are almost invariably employed. This practice, however, presents three serious drawbacks, namely:—(1) The headlights (usually) project beyond the extreme limits of the car, and are therefore very liable to damage; (2) the starting handle is made almost inaccessible, and (3) the headlights are too near the ground to properly illuminate any undulating stretch of road.

The Bracket tilted forward to permit Bonnet to be raised.

The Normal Position.

#### THE MARSHALL HEAD LAMP BRACKET.

The method which I have adopted is free from the above objections, and is carried out as follows:—Each head light, which may be placed in any situation desired, is supported by two bars, pivoted together at their upper extremities, and forming, with the frame of the car, a triangle. The lower extremity of each "front" bar is pivoted to the car frame; while that of each "back" bar may be slid along in a slotted guide, attached to the car, on loosening the butterfly nut shown. The front pivoted bars are solidly connected by a cross member, which allows the whole contrivance to be pulled forward with one hand whenever it is desired to raise the bonnet. The lamp "forks" are attached to the back sliding bars, so that the lamps remain erect in all positions of the arrangement. Referring to the accompanying illustrations, Fig. 1 illustrates the position of the lamp bracket after it has been slid forward during raising of bonnet; while Fig. 2 shows normal position of the lamps. I should add that the bracket, for which a patent is pending, is absolutely rigid; one of my lamps is a lenticular projector weighing over 22 lbs.—Yours truly,

JOHN F. MARSHALL.

### SPEED OF MOTOR-CARS ON PUBLIC HIGHWAYS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a frequent traveller along the public roads in Somersetshire, may I draw attention through the medium of your widely circulated columns to what appears to be a great and growing danger arising from the reckless and inconsiderate driving of many private motor-cars? The chauffeurs, in many instances, greatly exceed the limits of speed which ought to be observed along our narrow roads, if

public safety and the comfort of other travellers are to be the first points to be borne in mind. That in many cases they neglect the ordinary courtesies of the road I, for one, have had most ample proof. If, upon hearing the hooting of a motor-car, a bicyclist or, indeed, any other traveller, whether walking or driving, draws in upon one side, it is only natural to suppose that, when space is limited, the chauffeur will give in on his side also. But, apparently, his object is to rush every one off the road and to claim a monopoly of the highway. It is difficult to write with patience about these people, but the state of things is rapidly becoming intolerable, and our objections to this selfish and reckless driving are not lessened when we reflect that the occupants of these cars come from a distance, are of very little use to the country districts, and break up and pulverise our roads to an alarming extent in dry weather without contributing a single farthing to the local rates.

It is, however, in the narrower turns of the roads that the greatest dangers to life and limb lurk. Very often on the white roads, metallised with the carboniferous limestone of the quarries, the surface just moistened by rain or mist is extremely greasy and slippery, as the bicyclist knows to his cost. At such a time the utmost caution should be exercised by chauffeurs, as the wheels of the cars, judging from their very "wobbly" appearance, do not seem to have that grip upon the roads that they ought. A terrible accident might easily occur to any man, woman, or child in this way.

Again, the chauffeurs ought to "slow down" when they approach a curve. The accident at Knoll Wood, near Quantockshead, the

other day, when a motor-car ran into a horse and broke its leg necessitating its immediate destruction, would never, surely, have happened if a safe speed limit round the two curves of the road which follow one another there had been observed. No car should be permitted to swing round these or similar curves at a dangerous pace, and even twelve miles an hour may be dangerous, to say nothing of fifteen or twenty miles an hour. The latter limit is absolutely ridiculous along our roads. It may be tolerated when there are parallel footpaths running along broad highways, as you see them in the neighbourhood, for instance, of Oxford, but not in West Somerset.

However, I hope that, before worse things happen, a certain amount of watchful police supervision may be brought to bear by the superintendents of police upon the doings of these reckless motor-cars along our Somerset roads, and that a few sharp convictions may serve to remind the wealthy owners, who must be held responsible for their driving, that the public highway is not their monopoly in any sense of the word. In writing the above I have not a word to say against motor-cars in themselves, or those who use them in a considerate way.—Yours truly,

REV. WILLIAM GRESWELL.

### INFORMATION WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I ask through your columns if readers will give me information by letter directed to your office likely to be of assistance in a motor-car tour I am contemplating through England? I want to know of good hotels with a reasonable tariff at the following places which I propose to visit:—Kenilworth, Stratford-on-Avon, Gloucester,

Tintern or Chepstow, Cirencester, Oxford, Bedford, Cambridge, King's Lynn, Hunstanton, Boston, Lincoln, Matlock, Baslow and Buxton.

Advice with regard to roads, traps, petrol garages and accommodation for chauffeur will be welcomed by—Yours truly,

MOTORIST.

[Not often do we receive such a comprehensive question, but prompt letters from any hotelkeepers or petrol agents in the towns named will be forwarded to our correspondent if he will forward his address, omitted from his letter.]

### SLIDING CHANGE-SPEED GEARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On page 208 of the *M.C.J.* of the 28th ult. we notice a letter signed "A. J. Williamson" on sliding change-speed gears. It is quite true that up to now practically the only gear which has met with any real success is the Train Balladeur system, which is mechanically absolutely wrong, for two running cogwheels are suddenly brought into mesh on their extreme edges, where circumferential speed is at its greatest.

Up to the present many attempts have been made to obviate this, but they have all failed owing to poor mechanical design, as cogwheels running loose on their shaft soon wedge together. A new gear, the Crepet, has lately been placed on the French market, which obviates all these difficulties by placing ball ring races between the cogwheels, thus preventing them from wedging and taking up surface friction. Owing to the immediate and unqualified success of this gear, the demand has

1.58 tons and 2 tons, the cost would be 4.47d. per mile. Comparing this with a cost of 0.90d. per mile would show a saving for a car fitted with solid tyres of 3.84d. per mile. In a distance of 12,569 miles, such as our client has run in a year, this would mean a saving, due to the use of solid tyres, of £201, or almost as much as the total expenses of running a car for the year, including 20 per cent. depreciation, which our client allows for, and wages, &c. It is often contended that, while the use of solid tyres may show a saving under this particular head, such economy would be more than eliminated by the excessive cost of repairs. As against this, our client shows for his distance of 12,569 miles a repair bill of £7 17s., or 0.15d. per mile. We take it that the above figures clearly demonstrate the economy of running a car which has been specially designed and constructed for solid tyres.—Yours truly,

THE ALBION MOTOR CAR CO., LTD.

### A PEUGEOT CAR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Re "Sailor Man's" letter in the *M.C.J.* of the 5th inst., I suppose your correspondent means the 7-9-h.p. Peugeot brought out in 1904. I think he will find that the trouble lies in the ball bearings requiring adjustment, which would have a tendency to make the wheels spread. To adjust the bearing, the wheels will require to be taken off. This is easily done by removing the brass cap and then taking off the nut, when the wheels will pull off the square on the axle. When the wheels are off a notched plate will be noticed. In the tool-box will be

Owing to labour troubles, many of the leading automobile works in Paris are at present being guarded by the military. The above illustration shows a number of the soldiers on duty at the Hotchkiss Works examining one of the three new Hotchkiss 130-h.p. Racing Cars which will compete in the race for the Grand Prix de l'A.C.F.

far exceeded the supply, and it has been found impossible to place it on the English market, but very large additions having been made to the works, the gear will very shortly be for sale in Great Britain. We may state that we exhibited one of the first Crepet gears ever brought to England at the recent Cordingley Show, and were astonished at the immense number of inquiries we received for it.—Yours truly,

J. C. LYELL AND CO., LTD.

### SOLID v. PNEUMATIC TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have examined with considerable interest the report on the tyre trials held by the Automobile Club of Great Britain and Ireland during the month of March last. We have been particularly struck with the cost per car mile of running with pneumatic tyres, even under conditions in which the legal limit of speed was not exceeded. At about the same time as this report was issued we received from a client of ours a yearly statement of the expenses incurred in running his 16-h.p. Albion station 'bus, fitted with solid tyres on the rear wheels. The car weighs about 25 cwt., has accommodation for nine persons, and carries light luggage in addition. The total laden weight is about two tons. The distance run throughout the year has been 12,569 miles. Comparing the cost of tyres per mile with that shown in the judge's report, an extraordinary difference is observed. Our client's tyres cost him 0.90d. per mile, whereas, taking the mean of the tyre costs in classes C. and D., in which the weight of the vehicles was respectively

found a C-shaped spanner, which fits the notches. To tighten, turn the notched plate to the right until quite tight, then turn back a quarter of a turn. Care should be taken to see that the bearing is not too tight. I think this will remedy his trouble.

I have used a 7-9-h.p. Peugeot for two years and have not had the trouble mentioned by your correspondent. As to requiring a new axle "Sailor Man" should write to Messrs. Friswell and Co. for their catalogue of spare parts for Peugeot cars.—Yours truly,

ANOTHER 7-H.P. PEUGEOT.

### REPAIR WORRIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—An experience of which I am at present the victim compels me to write to your paper to ascertain if any of your readers can recommend a good firm or company in Scotland or the North of England where one could have any small repairs expeditiously effected at a reasonable cost. When I purchased last year a motor-car, in my simplicity I ventured to think that the makers, for the sake of their reputation, would only have been too anxious to carry out any little repairs or renewals which from time to time might be necessary on their car; but, alas! I have been grievously disappointed. On April 6th I forwarded to the company a broken part of the steering gear, and three days later a part of the change-speed gear, to be repaired. As I had need of the car, I asked them to let me have both parts back in order as soon as possible. Notwithstanding, however, several reminders by

letters and a telegram, and even a request to return the parts that I might get them put to rights elsewhere, I am still without them, and the only satisfaction I have received is that, owing to the congested state of their work, they cannot say when they will be able to comply with my instructions. The work on both parts is, I have ascertained, only a matter of a few hours. My car has thus, of course, been useless to me for the last five weeks, and at a time when I was in need of it. I cannot afford to keep a spare car for such occasions, although I fear that anyone purchasing a car as I did must be prepared to do this unless he wishes to be placed in the same unfortunate position in which I now find myself. Such business methods can hardly commend themselves to the public.—Yours truly,

E. S. 162.

### EXCEEDING THE LEGAL LIMIT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of April 28th, under "Here and There," you instance as a great performance of what a modern motor-car can do, a run on a 20-h.p. Talbot from London to Manchester. The journey was accomplished in 5½ hours. The "performance" is certainly worth noting from an anti-motorist's point of view when one considers that the driver of the car averaged thirty-four miles an hour—in fact, a fraction over—for the entire run. I ask you, Sir, are such facts worth advertising? When everyone's hand seems against us, can we expect the police to give up traps and the public cease writing letters to the Press complaining of reckless and inconsiderate driving? To average thirty-four miles an hour on any road in England is considered very inconsiderate driving, whatever the Talbot driver may think. Of course I don't know the exact route taken; the Manchester road is, through Derby, Belper, Matlock, &c., 188½ miles.

I am not an anti-motorist, having driven various motors since

The brass Car Badge issued to Members of the Automobile Association, to be fixed to the middle of the top of the dashboard or canopy.

early '99. If entered, the 20-h.p. Talbot should, on your showing, have a good chance for the Tourist Trophy, if only for speed. Thirty-four miles an hour on a give and take is distinctly good. Perhaps the Talbot went by a short way and did not exceed the legal limit.—Yours truly,

A. STEDALL.

### TROUBLE WITH DE DION GEAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Medicus" in the *M.C.J.* of the 5th inst., I had much the same trouble with my 8-h.p. De Dion, and had the clutches re-fibred several times, only to give out again. Messrs. Henry Moore and Co., of Brighton, advised me to have a metal-to-metal clutch; which I did, and so far have had no more trouble of any sort.

I have been told that if one has a "tread" on one driving wheel and not the other, the "differential" is likely to suffer; is this so?—Yours truly,

ANOTHER MEDICUS.

### DUST AND MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Why all these experiments to prevent dust? The thing has been done for years by the Corporation of Scarborough owing to their excellent system of road making. Some ten years ago I lived there, and was much struck by the superior roads and the small amount of repair they appeared to require. They were dustless, smooth and always dry. Even after a heavy shower there was no mud and no wet places.

It seemed to me that the roads were coated with tar and sand about twice per annum and needed no more attention. Except that they are black, I have seen no roads to equal them anywhere in the world. Two

men with brooms, and a man with a shovel and horse and cart, have an easy job removing the horse droppings and bits of paper and fruit skins that are to be found here and there, and in summer the water cart has little to do beyond spreading a disinfectant tainly over the perfect surface. There is no expensive patent material used, just common tar and sand, and the effect is perfect.—Yours truly,

C. D. L.

### THE LONDON COUNTY COUNCIL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was glad to see the reference in a recent issue of the *M.C.J.* to the exasperating waste of time which takes place in the motor-car department at the London County Council in Spring Gardens, S.W. The whole operation of taking out a registration number or driving licence wants badly remodelling. First you go up to the third floor, where you wait your turn to receive attention and fill up the necessary form. Then another form is given you with instructions to descend to the cashier's office on the ground floor to pay the necessary charges. Here you have again frequently to wait your turn, after which it is once more necessary to ascend to the third floor to secure the desired registration number or licence. Altogether the whole system is badly arranged, and if the money must be paid into the cashier's department I fail to see why some sort of small lift cannot be installed between the two offices, so that the official who makes out the licence should also take the cash and hand it over to the cashier, and so save a large amount of valuable time.—Yours truly,

ANTI-TORTOISE.

### SPRING WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—While I think all will admit that the pneumatic tyre is the greatest bugbear of the motorist and the chief factor in preventing men of small or moderate means from becoming owners of cars, yet it seems to me that the inventors of spring wheels and other contrivances of a similar nature are not going to do much towards helping us out of the difficulty. They are introducing a new complicated and expensive appliance, which, although it may to a certain extent fulfil its purpose, may also prove troublesome and costly to maintain, while to me it appears that the same result can be obtained quite simply by using wheels of larger diameter and really efficient springs on the car. Can any of your readers inform me what there is against such a very simple and obvious way of getting rid of pneumatic tyres that none of the manufacturers appear to give it a thought? Is it only fashion, viz., that of having small diameter wheels, that stands in the way, or is there something else against it? I quite see that the larger wheels would have the effect of raising the car body somewhat higher off the ground, but this would not matter for moderate speeds, and be a very positive advantage in minimising the dust nuisance. With the live axle and central drive there might be difficulties in increased torsional strain, but this would not apply to the chain drive.

I have been told quite seriously at some of the shows that a car fitted with solid tyres would soon shake all to pieces, but this I know to be absolute nonsense, as I have driven a car for eleven years fitted with solid tyres and over some of the roughest roads in the kingdom and the car is still running as well as ever, while my repair bill has been very small, but then mine really are springs, and though there is, of course, much more swaying movement to the body, yet it is far less tiring than the short, sharp, jerky movement of the cars fitted with small wheels, pneumatic tyres, and rigid springs, such as are the present fashion.—Yours truly,

J. BRYANT.

### TROUBLE WITH AUTOMATIC INLET VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a two-cylinder engine fitted with automatic inlet valves. After starting engine I find it blows back into the carburettor every now and then, especially when running quick. I have ground the valves in and also fitted new ones, but this does not alter it. Would it be caused by exhaust valves? I also find the water gets very hot although there is good circulation with the pump. I will feel very grateful if some of your readers will tell me the cause of the trouble.—Yours truly,

ENGINEER.

["Engineer's" trouble is no doubt caused by the valve springs having become weak. We would advise putting stronger ones on to remedy the firing back in the carburettor. The overheating is in all probability caused by the cylinder head being carbonised inside; to remedy this, it will be necessary to remove the cylinders and clean out the same. This should effect an improvement if the water circulation is good.]

MR. E. EASTON, of 2, Garfield Terrace, Netley Abbey, has made a non-slipping motor wheel of interest to all concerned with the mitigation of the dust nuisance.

THE DAYTON CAR.—Replying to Mr. T. W. Banerji, Calcutta, the car illustrated in the *M.C.J.* of March 17th last is made by the Dayton and Mashey Automobile Works, 4160, Ellis Avenue, Chicago, U.S.A.

CARS FOR MEXICO.—Sr. M. Almeida, of Calle 52 & 502, Merida de Yucatan, Mexico, writes that he is anxious to receive copies of the catalogues of British builders of motor-cars

## CLUBS AND ASSOCIATIONS.

### KENSINGTON.

THE opening meet of this newly-formed club took place on Saturday, the venue being Banstead Downs. The following members were present:—Messrs. T. C. Owen (Panhard), H. E. Rodwell (Darracq), Prof. V. Spiers (De Dion), Dr. W. H. L. Copeland (White), Mrs. Grylls (White), J. H. Reeves (Orleans), J. J. Rawlings (Kensington), Dr. W. S. Cox (Panhard), W. H. Mapplebeck (Winton), Dr. L. C. Dobson (Humber), Dr. V. A. L. E. Corbould (Richard-Brasier), W. R. Beilby (Spyker), W. H. Thompson (Prosper Lambert), E. F. Philbrick (Mors), E. Bridgland (Vinot), D. J. Muirhead (Whitlock-Aster) and R. E. Haywood (motor-cycle). A considerable number of members regretted inability to attend, the most prevalent reason being "car not yet delivered." A run was enjoyed to the Burford Bridge Hotel, where about fifty members and their friends took tea, after which at varying intervals the cars started homewards.

The fixtures for the season include meets at the Hautboy Hotel, Ockham; the Compleat Angler, Marlow; Angel Hotel, Guildford, and attendance at the provincial gathering of the Motor Union.

E. C. Porter; 4½-h.p. Armadale, R. Batchelor; 10-h.p. Armadale, A. C. Godwin Smith.

### AERO.

MR. E. RIDER COOK made an ascent in the balloon Vivienne III. on Saturday afternoon, starting from the Crystal Palace, and making the "solo" trip necessary for qualification as a pilot of the Aero Club. The atmospheric conditions were perfect, and the balloon passed over the Thames at Westminster, and, moving at the rate of fifteen miles an hour, made an excellent descent at Bedford.

### YORKSHIRE.

THE Yorkshire Automobile Club held its first inter-club meet on Saturday last, at Boroughbridge, meeting the members of the Cleveland Branch at the Crown Hotel. The meet was in every way a success, and the club will in the future arrange similar functions. Over fifty cars took part in the meet, about 150 members and friends being present.

A committee meeting was held after tea and it was decided to hold this year's speed trials on the Sands between Saltburn and Marske. The sands had been inspected by a sub-committee the week previously and were found to be eminently suitable for the purpose of holding speed trials. The agent of Lord Zetland and the District Councils of Saltburn and Redcar have been approached, and their sanction obtained to the speed trials taking place on the sands, provided that the course is properly protected; this will be done, for the club is determined not to have

The above illustration is reproduced from the picture portion of the very artistic poster just issued by the Star Engineering Company. As will be seen, it depicts a Star Car at the Ruins of Pompeii. Unfortunately our picture does not show the colouring of the poster, which is a very striking one, and should form an effective advertisement for these well-known cars.

### ESSEX.

STARTING from Ongar, on Saturday, the Essex Motor Club held a non-stop and reliability trial over a 150-miles course in Essex. A feature of the trial was the slow speed and driving tests which were held *en route*. Punctures were plentiful, and, owing to minor ailments, no competitor in the tri-car class finished. In the motor-bicycle section Mr. H. E. Blackeney, on a Werner, was disqualified for arriving too early, and first place went to Mr. F. Hulbert, on a Triumph, Mr. F. Applebee, on a Rex, being second.

### AUTO CYCLE CLUB.

ON the recommendation of the judges, the Committee of the Auto Cycle Club has decided to award non-stop certificates to the following machines, which competed in the second quarterly trial, held on Wednesday, April 25th last:—*Bicycles*—3½-h.p. Brown, R. M. Brice; 3-h.p. Triumph, F. Hulbert; 3½-h.p. Clyde, J. Shaw; 4-h.p. Werner, O. C. Godfrey; 3½-h.p. Rex, F. W. Applebee; 3½-h.p. Quadrant, L. W. Bellinger; 4-h.p. Werner, E. W. Ashworth. *Tri-cars*.—10-h.p. Invicta, W. Barnes; 9-h.p. Riley, L. Vandervelde; 9-h.p. Singer, Bert Holland; 6-h.p. Riley, A. Carpmal; 10-h.p. Lagonda, Morton Stuart; 9-h.p. Riley, J. Browning. Certificates, giving a record of the performance, will also be awarded to the following machines, which had minor troubles on the road. 2½-h.p. Kerry, G. Aldington; 5½-h.p. G.B., F. E. Cox. *Tri-cars*, 6-h.p. Invicta

a repetition of what took place at Filey last year. The superintendent of police for the district has intimated his willingness to undertake the duty of protecting the course, and the club will work in co-operation with him, and if found necessary over 100 police officers and several mounted police will be engaged.

### CARDIFF.

SOME of the results in the hill-climbing competition organised by the Cardiff Motor Club at Penttyrch on Wednesday of last week were interesting. In one event Mr. W. Pollard (3½-h.p. Quadrant) was placed first, and Mr. G. H. Smith (3½-h.p. May M.C.), was second. In the other competition the winners were Messrs. A. Williams and T. Silver respectively, each riding a 3½-h.p. Quadrant motor-cycle.

### ULSTER MOTOR CYCLE UNION.

THE reliability run of the Ulster Centre of the Motor Cycle Union of Ireland, postponed from the previous week, was held on Saturday. Owing to the increase in the number of small cars now in use by the members, it was recently decided by the committee to open the majority of the competitions to members who drive or own cars up to a certain horse-power, with the result that in the contest under notice four out of the eight competitors drove their own cars, as will be seen by the following:—T. Ireland, 10-12-h.p. Humber; T. Clapham, 12-h.p. Cottareau; J. Garrett, 8-h.p. Rover; J. Holden, 6-h.p. Rover;

P. Savery, 3-h.p. Humber motor-cycle; J. Stewart, 3-h.p. Triumph motor-cycle; R. Kenneth, 2½-h.p. Coventry Eagle motor-cycle; C. Montgomery, 3-h.p. Rover motor-cycle. The start was effected from Fortwilliam Park, Shore Road, Belfast, at three o'clock. Owing to the continuous rain of the Friday and the early morning the roads were in a bad state for some miles, but once beyond Whitehead a change set in and an improvement was noticeable until reaching Glenbrow. From there to Coralough roads were as bad as could be, after which some miles of average surface up to Ballycastle, where the finish was reached just on minimum time, ten minutes after six. Messrs. Gorrett, Ireland, and Stewart were the first to arrive, quickly followed by the others, who finished inside schedule, with a non-stop to the credit of every one of the competitors that started in the event.

### THE MOTOR CYCLING CLUB.

THE annual twenty-four hours' motor run from London to Edinburgh, organised by the Motor Cycling Club, will take place on Friday, the 1st prox. Motor-cars will take part in the journey, and a competition for the "Schulte" cup will be held in conjunction with the run. The start will take place from the top of Highgate Hill at 10 a.m., and Edinburgh is to be reached not later than 10 p.m. the following day. Any motorist wishing to participate in the trip should at once communicate with the Hon. Sec., Mr. A. Chandler, 1 Lime Grove, Shepherd's Bush, London, W.

### ROYAL NORTH OF IRELAND YACHT CLUB.

THE motor meet and competition of the Royal North of Ireland Yacht Club was held at Cultra, Co. Down, on Saturday, having been postponed from the previous week on account of bad weather. The club

The Brotherhood 20-25-h.p. car recently supplied to the Right Honourable the Marquis of Zetland. The chassis has a 9 ft. 9 in. wheel base, and embodies all the special Brotherhood points, such as two-pedal control and automatic timing of ignition, whilst the body is a very roomy double landaulet by Hamshaw, of Leicester. A special feature is the great amount of room inside the back of the body for five people on the relatively short wheel base.

entertained the members and friends to afternoon tea in the clubhouse. Between 400 and 500 people were present, the attendance of nearly sixty motor-cars being also recorded.

The course was over a private road, having been placed at the disposal of the club by Mr. R. J. Kennedy, D.L. The total length of the hill is 700 yards, with a rise of 108 feet. The steepest gradient was 1 in 11, the average being 1 in 19½. The results were as follows:—

#### FOR CARS OF 15-H.P. AND ABOVE.

Major M'Cammon	16-h.p. Minerva	1
Mr. G. Craig	18-22-h.p. Daimler	2
Mr. F. Workman	15-h.p. Darracq	3

Mrs. Vincent Craig was the winner of the ladies' competition.

#### FOR CARS OF 10-H.P. AND UNDER 15-H.P.

Mr. F. Gardiner	10-12-h.p. Argyll	1
Messrs. W. H. and J. Carson	10-12-h.p. Argyll	2
Mr. R. E. Workman	14-h.p. Minerva	3

Miss Bostock was the winner of the ladies' competition.

#### FOR CARS OF UNDER 10-H.P.

Mr. J. W. Lemon	6-h.p. De Dion.	
Mr. A. Craig	5-h.p. Oldsmobile.	
Mr. W. P. Donnan	8-h.p. Darracq.	

Mr. R. E. Workman was hon. sec. of the Committee, which consisted of Messrs. H. Barbour, W. H. Carson, H. C. Craig, G. Craig, R. Gaffikin, C. W. Henderson, J. W. Lemon and W. C. Mitchell.

### WEST SURREY.

THE annual hill-climbing competition of this club was held on Saturday over a course of one mile near Pirbright, permission having been accorded by the Aldershot authorities. The average gradient of the hill was 1 in 25, the maximum, near the finish, being 1 in 9½ for a short distance.

One only of the twenty-six competitors failed to appear, and over 110 members and guests were present. An *à fresco* tea was served subsequently on the top of the hill, after which the prizes were presented by Mrs. Buttemer, Mr. R. McCaskill, 28-h.p. Pipe, and Mr. A. Leon, 14-h.p. Renault, being the winners in the class over 12-h.p., while Mr. A. C. Tessier, 12-h.p. DeDion, and Mr. J. F. Ponsford, 8-h.p. Clement, were successful in the class for cars 12-h.p. and under. The latter's Clement, it may be added, was a 1902 car, and had had over three years' hard work.

The handicap was framed by the A.C.G.B.I., the results and times being as follows:—

#### CLASS I.

##### CARS OVER 12-H.P.

	Car.	Handicap.	Net.
2. R. W. Buttemer	14-h.p. Renault	19 sec.	2.40
3. R. Court Treatt	16-h.p. Humber	scratch	2.35
4. J. Fletcher	20-h.p. Durkopp	18 sec.	2.42
5. G. A. Houghton	14-h.p. Renault	22 sec.	2.33
6. A. Leon (2nd)	14-h.p. Renault	12 sec.	2.13
7. R. Kirke	24-h.p. Dennis	27 sec.	2.55
8. R. McCaskill (1st)	28-h.p. Pipe	22 sec.	1.33
9. E. E. Pullman	15-h.p. Durkopp	16 sec.	3.24
10. R. Vogan	20-h.p. Simms		
	Welbeck	14 sec.	3.36
11. O. O. Wrigley	28-h.p. Daimler	3 sec.	2.37

#### CLASS II.

##### CARS 12-H.P. AND UNDER.

	Car.	Handicap.	Net.
2. Dr. B. Bond	10-h.p. Argyll	36 sec.	3.59
3. Dr. F. W. Bryden	10-h.p. Argyll	75 sec.	3.9
4. Dr. F. W. Bryden	6-h.p. Speedwell	91 sec.	4.14
5. W. G. Crothers	9-h.p. Darracq	48 sec.	4.11
6. Col. F. H. Fairtlough	12-h.p. Darracq	21 sec.	4.13
7. Dr. A. Fennings	12-h.p. Argyll	27 sec.	2.22
1. W. C. Houghton	10-h.p. Argyll	69 sec.	2.25
9. Miss Jenkinson	6-h.p. Siddeley	46 sec.	3.22
10. Major Kingdon	10-h.p. Humber	scratch	4.20
11. Dr. Minchin	8-h.p. De Dion	132 sec.	2.28
12. J. F. Ponsford (2nd)	8-h.p. Clement	76 sec.	2.6
14. Col. Rawstorne	8-h.p. Cadillac	50 sec.	3.0
15. R. S. Robertson	6-h.p. Wolseley	38 sec.	3.3
17. A. B. Tessier (1st)	12-h.p. De Dion	57 sec.	1.42
17. Dr. R. Thorne-Thorne	12-h.p. Darracq	21 sec.	3.59

The handicap is the time in seconds to be deducted from actual time of ascent.

### LADIES'.

THE following ladies have recently joined the Ladies' Automobile Club of Great Britain and Ireland:—Mrs. Robert English, Mrs. Guthrie, Lady Hamilton, Mrs. R. H. C. Harrison, the Hon. Mrs. St. John Mildmay, Lady Rodd, and Mrs. Horace Walpole.

The club will hold an automobile gymkhana in the grounds of the Ranelagh Club on the 30th of June. The committee have prepared a varied and interesting programme of six, or, rather, as the first and last are subdivided, eight events. This year it has been decided to open the competition to the sisters and daughters of members, and the Committee hope that many entries will be received before the 25th of June.

### DERBY.

ON Saturday the first of this season's competitions of the Derby and District Automobile Club was held at Hill Cliffe Lane, near Derby, in the form of a handicap hill climb. In order to do away with paper calculations the Derby Automobile Club have instituted a new form of handicap. Of course, as is the case with all such arrangements, it has possible drawbacks, but, judging from the extremely close finishes seen on Saturday last, its success may safely be taken as assured. One advantage over all other handicaps is that the winner is proclaimed at once. All the cars are sent up the hill against the watch, and the members are expected to do their best on this trial run. The cars are then drawn in pairs and the heats run off, the slower car starting first with its time allowance, and the driver first passing the finishing line passes into the second round, when the process is repeated until the final pair decide who is the victor. The closeness of the finishes, especially in the final and semi-final rounds, proved most satisfactory to the competitors and spectators alike; the final especially was a most exciting finish, Mr. F. A. Bolton, a vice-president of the club and the hero of many club medals, on his 30-40-h.p. Daimler, just failing to catch Mr. Cyril Smith driving an 8-h.p. Rover, the latter's consistent driving, by the way, being one of the features of the afternoon. The following were the results of the competition:—

First round.—Fletcher, 9-h.p. Mohawk, 1 min. 15 sec. start, beat.

Paget, 18-h.p. White; Mell, 15-h.p. Darracq, beat Eaton, 6-h.p. De Dion, 1 min. 5 sec. start; C. Smith, 8-h.p. Rover, with 43 sec. start, beat Burford, Minerva Trimo; Turnbull, 20-32-h.p. Darracq, beat Hewitt 8-10-h.p. Humber, who took 1 min. 39 sec. start; Bolton, 30-40-h.p. Daimler, beat Clifford, 10-h.p. Minerva, 1 min. 44 sec.; Leech, 18-22-h.p. Daimler, beat Joule, 15-h.p. Darracq, 38 sec. start.

Second round.—Mell beat Fletcher, 3 min. 13 sec. start; C. Smith, 1 min. 44 sec. start, beat Turnbull; Bolton, scratch, beat Leech, 53 sec. start.

Third round.—Smith, with 1 min. 6 sec. start, beat Mell; Bolton drawn a bye.

Final.—Smith, with 2 min. 36 sec. start, just managed to reach the finishing line before Mr. Bolton, thus taking the silver medal and Mr. Bolton the bronze.

Between the first and second rounds many of the members of the club and their friends adjourned to the house of Mr. H. E. Currey, of Tarncliffe, who had very kindly invited them to tea, and a most enjoyable half-hour was spent in the grounds, where Mr. Currey, assisted by his brother and sisters and their staff, attended most assiduously to the wants of their visitors.

The competition was extremely well attended by the members and their friends and others interested in the trials, and, besides those members already referred to, there were present Dr. W. G. Copestake, W. Sayer, N. Sayer, G. F. Reading, H. Jefferson, A. Ford, Ross-Browne, Major F. W. Peacock, C. A. Newton, H. E. Currey, and numerous friends and others, including Mr. W. Harvey Whiston, Rev. Cecil Currey, Misses Currey, Miss Slade-Jones, and Misses Sayer.

The final round was decided about 7 o'clock, after which the cars began to disperse. As has been the case on former occasions, the weather was perfect and the roads all that could be desired. The timing arrangements were, as usual, in the hands of Messrs. C. T. Leech (hon. treasurer) and Chas. J. Allin (hon. secretary), who on this occasion were assisted by Mr. P. E. Joule (assistant secretary) and their labours were considerably simplified by a pair of field telephones, an innovation initiated by the Derby Automobile Club, which proved of inestimable value in the timing arrangements, the wire, of which there was over a mile, having been laid down earlier in the day by these three officials of the club, who must have been extremely gratified at the immensely satisfactory result of their labours.

To-day the club, at the invitation of Mr. Francis A. Bolton, visit Oakmoor for the third year in succession, who on this occasion has most kindly extended his invitation to the members of the Nottingham and Leicester Clubs, and as an additional attraction Mr. Bolton is offering a silver cup for an inter-club hill-climbing competition, which will be contested by four representatives from each of the three clubs.

Mr. W. E. R. JACKSON, of 9, Hillside, Sunderland, is the Hon. Sec. *pro tem.* of the motor-cycle club that is being formed at Sunderland.

THE North East Lancashire Automobile Club have a reliability run from Whalley to Edinburgh, starting on the 18th inst.

TO-DAY (Saturday) is the last day for receiving entries for the Frome's Hill climb of the Herefordshire Club.

MR. A. W. MOORE is succeeding Mr. S. R. Rhodes as hon. sec. of the Wolverhampton Automobile Club.

AT the Derbyshire and District hill-climb on Saturday last, Mr. Bolton on a 30-h.p. Daimler did the fastest time, and Mr. Leach on an 18-h.p. Daimler the second fastest time.

A HILL climbing competition for motor-cycles, promoted by the Blackburn and District Motor-Cycle Club, was held at Withnell on Tuesday.

## THE ELECTRIC TRAMWAY AND THE MOTOR-BUS.\*

IT is a source of satisfaction to know that the paper is regarded as of sufficient importance to bring together an audience which represents the greatest experience obtainable in this country, both in regard to the operation of tramway systems and of those motor-omnibus systems now running, and, as was only to be expected in these circumstances, the remarks made on both aspects of the question, when intelligently read, form a most reliable and instructive criterion as to the relative fields of these two methods of rapid and popular transit.

I believe that I am justified in considering that the danger of side-slip is ever present, for even in fine summer weather there is the certainty of the omnibus meeting on its route with recently watered pavements, which is even more dangerous from this point of view than pavement that is continually wet, as in the winter weather, and the reference to ordinary touring motor-cars is not justified, since in the case of these it is within the power of the owner to use anti-skidding devices which are not commercially practicable at present for motor-omnibuses.

Again, the danger of the motor-spirit getting on fire in the omnibus is of an entirely different order to the similar danger which exists in a touring car, as the occupants of the latter, being only four or five in number, can readily alight; whilst the passengers in a crowded motor-omnibus might have much greater difficulty in getting free from the place. No doubt this special danger will be minimised in the future by the construction of the bodies of motor-omnibuses from non-inflammable material.

That motor-omnibuses have a large advantage over tramway systems in regard to the absence of need of going to Parliament for

powers when in the hands of private companies is very true, but it by no means follows that if motor-omnibus traction increases, as we hope it may, a general Motor Omnibus Act may not be passed by Parliament involving exactly the same sort of procedure on the part of promoters of such undertakings.

In order to do justice to the motor-omnibus, I have always assumed that improvements in their wear and tear will be made, but the actual expenses at present being incurred in the upkeep of motor-omnibuses do not maintain them in a really satisfactory condition, and most of those running in our streets are, in fact, wanting in greater maintenance, and, before we can talk of the material reduction in the cost of their upkeep, the leeway must be made up between the present comparatively inefficient maintenance and that which will be sufficient to meet the public point of view.

There is a very great deal in the contention that the running of tramcars on fixed rails is a possible help to the rest of the traffic of the road rather than the reverse. Certainly it prevents the whole of the width of the roadway being monopolised, as it often is at present in the London streets, by the motor-omnibus, an evil which is going to increase in the future, when greater numbers of these vehicles are running, and which may effectually serve as an object-lesson, disproving the academical pronouncements of those who maintain that by their use greater numbers of passengers are going to be carried with better convenience to other users of the road than is the case with electric tramway systems.

Motor-omnibuses have up to the present time been equipped with too small a power, and at the present moment the newer types

Mr. H. Pope on the Itala Car he drove in the Targa Florio Race.

of motor-omnibuses are employing motors which are even more than double the power of those originally used, and this will, no doubt, lead to more satisfaction being obtained from these vehicles in the future than in the past. At the same time, it must not be forgotten that the use of larger engines, generally exerting far less than their full power, may lead to increased fuel consumption, and thus to a certain extent neutralise the advantages otherwise gained. It, therefore, seems to me that to meet in an adequate manner the demands for increased power, some other method must be adopted than that of merely increasing the horse-power of the prime mover. In this connection it must also be recollected that the electric motor does not suffer from the same disabilities as the internal combustion engine, since increasing the power of the motor does not necessarily involve any appreciable difference in the energy consumed when working on light loads; and, further, the increases in the power of the electric motor may be obtained with but small increase of weight, whereas in the case of the internal combustion engine material differences in this direction are necessitated.

The statement as to the strain which the motor-omnibus is subjected to owing to the condition of the paving over which it runs raises a point of great importance, since the question of motor traffic may not be solved until the question of the roads is taken more seriously by the general public. This point raises the issue as to whether motor-omnibuses are for all time to be freed from the cost of the proper maintenance of the roads, or whether they are to be saddled with their fair proportion of this, as are the tramways, which do not wear the roads, the paving of which they pay for.

I should like to draw attention to the possibility of the motor-omnibus industry having, in the future, to add another item to its annual cost sheet, i.e., that of paying a portion of the maintenance of the road. In that case, the gulf which at present separates it from the economical

\* From Mr. Manville's reply to the recent discussion at the A.C.G.B.I.

costs of running electric tramway systems in crowded centres will be appreciably increased, and material improvements in other directions of costs will have to be made to keep it even in the position it occupies financially at the present time. I entirely agree that, so far, the motor-omnibuses now running have not had the advantage of proper organisation, both in maintenance and running, which electric tramway systems under experienced management have. It may be, however, that when the motor-omnibus systems are subjected to the same rigorous maintenance the present costs of upkeep may have to be materially increased. There is a great field for the use of motor-omnibuses as feeders to tramway systems, and, therefore, the supporters of the motor-omnibus who wish to see this field developed should behave less cavalierly to tramway systems than they have been in the habit of doing.

### ROAD REPORTS.

**ESSEX.**—Experiments are about to be carried out by the Essex County Council on the main road at Springfield, near Chelmsford, with the object of minimising the evils caused by the dust raised by motor-cars. During the past week the portion of the highway between Springfield village and Stump Cross Lane has been closed to vehicular traffic, necessitating a drive over the green and round by the church. The surface of the road has been treated with a preparation of tar.

**KENT.**—The Kent County Council have withdrawn from the proposed experiments in connection with dustless road materials.

**BLACKPOOL.**—The new road to Blackpool via Kirkham is now open and will be much favoured by East Lancashire motorists. Danger signals have yet to be erected at several of the sharp turns.

**PULVICIDE** is a new preparation for laying the dust. It takes the form of an emulsion, which is mixed with water and then applied to the roads by the ordinary water-cart.

**EASTBOURNE.**—The corporation has resolved upon a considerable extension of tarred slag roadways, with a view of minimising the dust nuisance.

**BUXTON.**—A portion of the main road in Buxton has been laid with cubette paving by the Welsh Granite Company, Ltd. This is a method that has been adopted in Germany with great success.

**TWICKENHAM.**—The Twickenham District Council have prepared plans for a much-needed widening of St. Margaret's Road, close to the top of The Avenue. The scheme has been before the council for over fifteen years, but it is felt that the increasing traffic, particularly in connection with motor-cars, now renders the widening imperative.

**SUSSEX.**—An experiment in dust prevention has been in progress at Billingshurst, Sussex. Mr. W. H. Puttock obtained permission of the Horsham Rural Council, and several of his neighbours have assisted, with the result that about 150 yards of the ordinary macadam road have been given a coat of boiling tar. The experiment has been tried on the old Roman road, Stane Street, the actual cost working out at 1½d. per yard super.

**MIDHURST.**—A direction board with arms indicating the directions of Haslemere, Petersfield, and Chichester, has been placed at the end of the market square at Midhurst, a corner where many motorists have previously gone astray.

### NEW COMPANIES REGISTERED.

**WOKING AND DISTRICT MOTOR 'BUS COMPANY, LTD.**—Capital, £3,000. To carry on the business indicated by the title. Bank Chambers, Woking, Surrey.

**LONDON DAIMLER COMPANY, LTD.**—Capital, £1,000. To carry on the business of motor-car, omnibus, van and cab proprietors, carriers of passengers and goods, etc. Registered office, 1, Broad Street Place, E.C.

**MANCHESTER ELECTROBUS COMPANY, LTD.**—Capital, £100. To adopt an agreement with the X Electric Accumulator Company, Ltd., and to carry on the business of motor-omnibus and vehicle proprietors, jobmasters, contractors, carriers of passengers and goods. Similar companies for Birmingham, Lancashire, Yorkshire, Nottingham, and Liverpool have also been registered, as well as the Provincial Electrobus Company, Ltd.

**ANGLO-FRENCH HERALD MOTOR COMPANY, LTD.**—Capital, £120,000. To adopt an agreement with Hamon and Co., and to carry on the business of manufacturers of and dealers in motor-cars, etc.

**MOYEU A ROUE ET FREIN PICQUENOT.**—Capital, £5,000. To acquire the right to work and exploit a French brevet d'invention granted to F. Grois and L. Picquenot, relating to an axle comprising free wheel and brake for bicycles and automobiles.

**NORTHERN GARAGE, LIMITED.**—Capital, £3,000. To carry on the business of manufacturers, letters to hire, repairers, cleaners, storers and warehousemen of and dealers in automobiles, etc.

**OSBORN AND CO., LTD.**—Capital, £1,000. To manufacture, sell, let on hire and deal in motors, etc. The first directors are Messrs. W. E. Owen and F. J. Osborn. Registered office, 6, Great Marlborough Street, W.

**MILDMAY MOTOR AND CYCLE STORES, LTD.**—Capital, £500. To acquire the business carried on by Mr. S. C. Stevens at 80a, Newington Road, N., as the "Mildmay Motor and Cycle Stores."

**MOTOR MAIL TRANSPORT SYNDICATE, LTD.**—Capital, £5,000. To carry on the business of engineers, manufacturers of motor-cars, motor wagons and accessories, transport agents, financiers, &c.

**AUTO SYNDICATE, LTD.**—Capital, £1,000. Objects: To acquire and turn to account certain patent rights known as "Auto-Mixte" (System Pieper), to promote companies, &c. Registered office, 30, Moorgate Street, E.C.

**NEW SPEEDWELL MOTOR COMPANY, LTD.**—Capital, £50,000. To carry on the business of manufacturers of and dealers in motor-cars, etc., and to take over the agreement entered into by Messrs. J. W. H. and A. J. Dew for the acquisition of the business carried on by the Speedwell Motor and Engineering Co., Ltd., at 151, Knightsbridge, S.W., and at Chiswick, W. The first directors are Messrs. M. L. Braithwaite, H. W. Howe, C. H. Dodd, A. J. Dew (managing director) and J. W. H. Dew (works manager). Registered office, 151, Knightsbridge, S.W.

**CLYDE MOTOR BOAT COMPANY, LTD.**—£1,500. To carry on the business of owners, hirers, builders, designers, storers, repairers, and cleaners of motor-boats, &c. Registered office, 48, West Regent Street, Glasgow.

**MAIL MOTOR COMPANY, LTD.**—£1,250. To carry on in Grimsby and Caistor, Lincoln, the business of carriers of passengers and goods, constructors and proprietors of automobiles, motor-cars, motor-boats and vessels, omnibuses, &c.

**MOTOR INVESTMENTS.**—£5,000. Objects as indicated by the title. **TENAX TYRE AND RUBBER MANUFACTURING COMPANY, LTD.**—£500. To carry on the business of manufacturers of motor and other tyres, agents for the manufacture of rubber, gutta percha, and gums of all kinds, &c.

**SCOTTISH ELECTROBUS COMPANY, LTD.**—£100. To adopt an agreement with the X Electric Accumulator Company, Ltd.

### COMPANY NEWS.

**THE ANGLO-FRENCH HERALD MOTOR COMPANY, LTD.**, closed its subscriptions on Wednesday. The capital is £120,000, and the first issue has been of 75,000 £1 shares.

**A. DARRACQ AND COMPANY (1905), LTD.**—At the extraordinary general meeting of A. Darracq and Company (1905), Limited, held on Friday, the 11th inst., Mr. J. S. Smith-Winby, who presided, said that the Board had been asked at previous meetings why the company had not taken up the manufacture of motors for heavy traction. The reply had been that Mr. Darracq was carefully studying the question, and that, until he was satisfied the problem had been satisfactorily solved, both for buyers and users of these vehicles, the company had determined not to embark on this branch of manufacture. With regard to such types as the Darracq Company were producing, Mr. Darracq was convinced that petrol would continue to hold the sway, but with weights of five tons and upwards it was necessary to look for some other motive power. Electricity might be dismissed as outside the region of practical politics, and when steam was mentioned thoughts turned to Mr. Leon Serpollet. They had decided to enter into arrangement with Mr. Serpollet, which would result in a combination of the inventive genius of that gentleman with the genius of Mr. Darracq as a manufacturer and factory organiser, backed up with ample facilities and working capital. The Serpollet omnibus was of over 40-h.p., and able to be driven up steep hills and over bad roads, either in town or country, with ease, rapidity, noiselessness and smoothness. The chairman then referred to the details of the agreement, and moved its adoption, which was carried unanimously.

### PUBLIC MOTOR SERVICES.

**THE Great Eastern Railway Company** are running a service of motor-buses between Lowestoft and Southwold.

A **MOTOR-BUS** service is to be established between Bridport and Axminster.

**ARRANGEMENTS** are being made for an extension of the motor-car service recently inaugurated in Kent, and there will soon be a service of motor-buses between Margate, Ramsgate, and adjacent villages.

A **NEW Arrow** line of motor-buses has commenced running from Shoreditch Church to the West End of London.

At the last meeting of Holborn Borough Council, the Works Committee reported having communicated with the Commissioner of Police and the London County Council with reference to the noise caused by motor vehicles and the dropping of lubricating oil on the asphalted carriage-way pavements in the borough.

By the refusal of the Select Committee of the House of Commons to sanction the construction of a line of tramways from the Marble Arch to Cricklewood, the motor-bus may be said to have gained a substantial victory. And this, notwithstanding the joint applications of the London and Middlesex County Councils for the tramway.

### THE ALBERT BROWN TROPHY.

THIS competition, organised by the Motor Cycling Club for cars of which the principal parts must be of British manufacture, will take place to-day, and should prove interesting, on account of the somewhat novel lines on which it will be run. The basis on which the awards will be made is a combination of reliability and weight carried for petrol consumed. Owing to the fact that the cars competing must be "home made" and be driven by members of the club, the entry is not a large one, but it is anticipated that as British-built cars increase in numbers the trophy will

be more severely contested in future competitions. The start will be made from Slough, and the route will be *via* Farnham Royal, Beaconsfield, High Wycombe, Dashwood Hill, Aston Rowant, Fullington, Stalhampton, Thane, Aylesbury, Wendover, Amersham, Beaconsfield, and Slough, a distance of seventy-five miles, which will have to be covered twice. The following are the entries:—

J. H. Reeves	...	4-cylinder 95 by 110 New Orleans.
F. J. Jenkins	...	4-cylinder 95 by 110 Rover.
A. Candler	...	1-cylinder 114 by 125 Rover.
C. V. Brown	...	4-cylinder 114 by 130 Rover.
E. Perman	...	2-cylinder 102 by 106 Bel-zie.
J. Platt Betts	...	1-cylinder 95 by 110 Rover.
Miss A. Bess Wood	...	6-cylinder Napier.
F. H. Johns	...	1-cylinder 114 by 120 Rover.
S. J. Sewell	...	4-cylinder 95 by 110 Rover.

The club has secured the services of Mr. F. T. Bidlake to act as timekeeper for the whole of the season's events.

### THE STORAGE OF PETROLEUM.

THE Rapid Road Transit Company, of Great St. Helens, E.C., were fined 40s. and 23s. costs at West London Police Court for improperly storing petroleum. The prosecution was at the instance of the London County Council, one of whose inspectors found five barrels of petroleum in an open yard at the defendants' premises in Prince's Road, Notting Hill, instead of in an adjacent receptacle licensed for the purpose. It was explained for the company that all the men had left the yard, on strike, on the day in question, and the contractors' carmen had simply "dumped" the barrels in the yard.

### A CAR ON FIRE.

CONSIDERABLE excitement was aroused in East Grinstead on Sunday, when just outside the Dorset Arms Hotel a motor-car suddenly burst into flames. It seems that a party of five gentlemen in a motor-car alighted at the hotel, and it was found necessary to replenish the petrol tank. Suddenly the petrol, which was evidently overflowing, ignited. The car had been drawn up close to the kerb in front of the hostelry, and directly it caught alight the hotel was in danger of catching fire. As it was, the signboard and the porch caught alight, and the front portion door and window frame were blistered by the heat. The car was dragged from its position into the centre of the road, and there it was allowed to practically burn itself out, the only portions saved being the tyres.

### TRACTION ENGINE OR STEAM WAGON.

THE Eastern Motor Wagon Company, Limited, of Bow Road, London, E., have come out successfully from an attempt on the part of the Staffordshire police to define a heavy steam wagon as a traction engine. The wagon was one of the earlier type of "Foden" lorries, weighing nearly seven tons unladen, and was being taken to the makers' works at Sandbach to be reconstructed. The traffic manager, Mr. A. E. Brassington, was in charge of the wagon at the time the vehicle was stopped at Trentham, near Stoke-on-Trent, and was then told that there was a bye-law in force in Staffordshire under which all vehicles had to carry two head lights, and at the time this wagon was only showing one light, on the off side. The police-sergeant took the registration number from the front, and asked to see the driver's licence, and also copied the particulars as to weight which were painted on the wagon. The company expected to receive a summons for non-compliance with the county lighting bye-laws, and were prepared to contest the charge on the ground that no bye-law could override the regulations of the Local Government Board, so far as motor vehicles were concerned. They were served with two summonses, first for using a locomotive without having a third man to attend to passing vehicles, and the second for not showing two head lights as required by the Locomotives Act, 1865.

When the case was heard the police sergeant admitted that the defendant had afforded him every explanation, and that a bright light was burning on the off side. The defence produced a photograph of the wagon, so that the magistrate could see that it was not a traction engine, and produced a copy of the Heavy Motor Car Order, pointing to Article 4, Section 5, under which the vehicle was registered. They also produced the certificate of registration, and the Use and Construction Order as to lights. The magistrates said that the summonses should not have been issued, and dismissed them both. On an appeal as to costs, they granted an order for four guineas against the police.

### THE IDENTIFICATION OF THE DRIVER.

BEFORE Mr. Horace Smith, at the Westminster Police-court, Robert St. John Willans, of Gillingham Street, Pimlico, has answered a summons, under the Motor Car Acts, for failing to give information which would lead to the identification of the driver of a motor-car for reckless driving on the Portsmouth road, at Cobham, on the 5th ult.

Mr. Muskett, who appeared for the police, said the proceedings were taken under section 1, sub-section 3, of the Motor Car Act, 1903. If a person had, in fact, committed an offence by reckless or negligent

driving, or to the common danger, it was incumbent upon the owner to assist by giving all the information in his power which would lead to the identification of the driver.

It was alleged that the motor-car of which the defendant was the owner was being driven on a particular day at a reckless or excessive speed. At the time it was impossible to obtain the name and address of the driver, and as it was desired to obtain this and take proceedings against the driver, the Surrey police worked in conjunction with the Metropolitan police, and Inspector Green in due course called upon the owner, who resided in the Metropolitan police district. He asked for the required information, and stated the grounds upon which it was required. Mr. Muskett submitted that the owner was bound by law to give this information, and if he did not he was liable to a penalty under the section.

Mr. Horace Smith agreed that the interpretation really was that the owner shall give every information in his power to assist in the identification of a driver.

Mr. Staples Firth said the summons had been trumped up at Scotland Yard. It had been deliberately concocted. The Surrey man came, and was given all the information he wanted, and then four days later another officer from the Metropolitan police called. It is an outrage that these charges should be concocted for the purpose of taking proceedings against motorists. The police are trying to obtain evidence to bring another charge against us. I submit that the summons absolutely fails. It is contrary to all notions of English law that one person should be compelled to give information against another.

Mr. Horace Smith imposed a fine of £10, and as both sides asked

Pain's Hill, near Cobham, Surrey. The Police are working a Trap from the Footbridge seen in the Picture.

Photo by

(Colonel Boscworth.)

for costs, his worship set one off against the other, and allowed none save that for the summons.

### THE MAIDENHEAD BRIDGE CASE.

RECOLLECTIONS of the struggle for the freeing of the Maidenhead bridge from tolls are revived by the case of Taylor v. the Corporation of Maidenhead, which was in the Courts on Saturday. This case was originally an action in which the writ was issued in 1902, Mr. Taylor claiming 4d., paid by way of tolls over Maidenhead Bridge, and asking for an injunction restraining the Corporation from levying toll on the ground that it was illegal. In 1904 an Act of Parliament was passed abolishing tolls over the bridge, but the action was continued. In February, 1905, when the plaintiff said his costs amounted to about £5, the Corporation offered to consent to a dismissal of the action without costs, but the plaintiff declined the offer. His lordship remarked that after the passing of the Act of Parliament the action became one of 4d. only. He made an order allowing the plaintiff £5 costs up to February, 1905, the costs of the Corporation since that date to be set off against them. The plaintiff's application for a stay of execution pending an appeal was refused.

### A BOMBAY APPEAL CASE.

At the Bombay High Court, on the 11th ult., the Chief Justice, Sir Lawrence Jenkins, delivered judgment in the case referred to by Mr. Ernest Esdaile in his recent letter to the M.C.J., and which excited the greatest interest amongst motorists of all classes in Bombay. Mr.

Bayne appealed for revision of sentence of one day's imprisonment, a fine of Rs. 200 and permanent withdrawal of his licence passed on him by the Third Presidency Magistrate, for negligent driving of a motor-car.

The Chief Justice declared that the sentence of imprisonment could not stand. He could not say that the fine was so severe as to call for the interference of the Court in revision. Dealing then with the order that accused should be permanently disqualified from holding a licence, Sir Lawrence Jenkins said, arguments of this part of the case need not be considered, for this part of the sentence was illegal. It was admitted by the prosecution and by the magistrate himself, who had very properly made a representation to the High Court to this effect and had requested the annulment of the order. There was only the question of the period of the disqualification and the Court ordered the period of suspension to be reduced to three calendar months from the day of the magistrate's order.

#### CASES AGAINST MOTOR-BUS DRIVERS.

WILLIAM ARTHUR TICHNER, a motor-'bus driver, was summoned, at the South-Western police-court, for failing to make prompt and effective use of such means as would stop the action of the machinery when his 'bus was stationary so far as was necessary for the prevention of noise; also for quitting the car without taking due precautions against its being started in his absence. Mr. Muskett, prosecuting for the Police Commissioner, explained that the grievance was that when the 'buses were put on the rank at the journey's end the machinery was allowed to continue in motion, and that the drivers did not take the available steps to stop the horrible noise that was sometimes created. The defendant said that before leaving the car he throttled down the engine, applied the brakes, and, in fact, did everything but stop the machinery altogether. Mr. de Grey, after a lengthy inquiry, came to the conclusion that the driver took all precautions against the restarting of the car in his absence. What the actual effect of the words "due precautions" were he did not know; it might mean every possible precaution, or it might mean reasonable precautions. The driver did take reasonable precautions, and therefore he dismissed the summons. With regard to the noise, he was of opinion that the case had been made out, and he imposed a nominal penalty of 2s. 6d., with 2s. costs. This ruling also applied to three other drivers summoned for similar offences.

At the Thames Court on Saturday, Joseph W. Hussey, 17, Stadium Street, Chelsea, motor-car driver, was summoned for driving a motor-'bus at a speed exceeding twelve miles an hour in the Bow Road, and several witnesses having given evidence of a contrary character to that of the police, the magistrate, Mr. Dickinson, said it was a question of estimated speed on one side and mechanical proof on the other. He could not imagine a more accurate method of testing the speed than by using stop-watches, and the constables had passed tests for taking the times. He could not doubt their evidence, and defendant would be fined 20s. and 23s. costs.

THOMAS ROBERTSON SIMMONS, driver of one of the Great Eastern Motor Omnibus Company's cars, was summoned at the same court for a similar offence, and in this case it was stated that he was going at a speed of 13½ miles an hour, but it was admitted that the two stop-watches did not agree. Defendant was fined 5s. and 23s. costs.

#### POLICE TRAPS.

THE measured furlong in the London Road, Morden, is in daily operation.

POLICE activity continues on the Lancaster-Carlisle road.

HITHERTO the road to Folkestone has been fairly safe to motorists—a state of things that appears to be coming to an end, owing to local enthusiasm for the game of police traps.

It would appear that we shall have to do for the drivers of motor-'buses what we have previously regarded as mainly for those who steer cars, viz., give particulars of special traps intended for their capture. The police have a measured furlong in the Bow Road for the purpose of keeping observation on the motor-'buses plying between Bow Bridge and Putney.

A CORRESPONDENT who follows our list of police traps each week writes that he ran into one the other day which has not been previously notified. It is on a 220 yards length close to Edgware, on the road from Buckingham to London. Three officers are located within half a mile of the spot where the tram lines commence.

#### MOTOR-CAR ACCIDENTS.

At Battersea, Mr. Troutbeck has held an inquest on Arthur J. Porter, whose death occurred as the result of a motor-car accident on April 26th. Sydney White said that on April 26th he saw a cyclist riding towards Battersea, in Windmill Road, Wandsworth Common. At the same time a traction engine, with three trucks, was proceeding in an opposite direction, and a motor-car followed it. The cyclist passed in front of the engine, when the motor-car dashed into him and knocked him some considerable distance. The car pulled up and the deceased man was taken in it to hospital. The engine was large enough to conceal the cyclist from the car and the car from the cyclist. The Coroner, in summing up, said that when driving in London one had to be prepared

for unreasonable and reasonable occurrences. The jury returned a verdict of "Accidental death," attaching no blame to the driver of the motor-car.

AN accident occurred on the hill leading from Beachy Head to Eastbourne on Monday. A motor-car owned by Mr. James Bussey, of London, was being driven down the hill rather late in the evening, and when turning the corner near the reservoir skidded and overturned. The occupants were thrown out, and both sustained bruises.

A RATHER serious motor accident, involving injuries to a Hastings lady and gentleman, has occurred on Silver Hill, between the villages of Hurst Green and Robertsbridge. By some means the driver, Ernest Oliver, lost control of the vehicle, which dashed into a bank at the right-hand side of the road. The impact caused the car to overturn, and the three occupants were violently thrown out.

WHILE a motor-car, containing half a dozen persons, was being driven along Telegraph Road, Gayton, in the direction of Birkenhead, on Monday, it came into collision with a motor-cyclist named Watson, of Hoole, Chester, who was seriously injured.

KNOCKED down by a motor-car in Nottingham Road, Ilkeston, a boy named Levett, aged six, has had his skull fractured, and died at the hospital.

#### CASES AGAINST MOTORISTS.

A MOTORIST named Thomas Carpenter, of Ealing, was sentenced to a month's imprisonment in the second division by the Guildford magistrates on Saturday for driving to the common danger at Shalford, and failing to stop when called upon to do so by the police. Evidence was given that the car was travelling at a speed of 37½ miles an hour. Seven previous convictions, three for driving to the common danger, were proved. Carpenter gave notice of appeal.

SEVERAL cases of exceeding the legal limit have been heard at the Croydon County Bench, fines of about £3 being the average. In one case the defendant had not sufficient money to pay the fine and the chairman lent him the balance on his promising to return it.

ALBERT JOHN CARTER, chauffeur, was again charged at Hemel Hempstead on Saturday with the manslaughter of Mr. Charles Preston, of Lancaster, who died from injuries he received in a collision between a motor-car in which he was riding and a hay-cart at Markyate. He was committed for trial.

AT the West Riding Court, Bradford, Abraham L. Rhodes, managing director of the Rhodes Electrical Engineering Company, Bradford, was summoned for driving a motor-car to the danger of the public. The case for the prosecution was to the effect that on the afternoon of April 25 last the defendant was driving a car on the Leeds and Bradford road at Calverley. As it ran along from Bradford its speed attracted the attention of two constables, who timed it from the moment when it apparently was passing the Farmer's Inn until it reached Four Lane Ends, which distance of 490 yards was traversed in twenty-nine seconds. For the defence it was denied that the speed had been as great as had been stated, and that there was at any time danger to the public. The defendant and others who were in the car with him declared that the speed never reached above fifteen miles per hour, and that for some time the vehicle kept pace with the tramcar past which it had been alleged to "flash." The chairman, Sir Theo Peel, said that the magistrates were satisfied that the car had been driven to the danger of the public. They had considered whether to suspend the defendant's licence, but in view of the fact that there was really nothing against him they had decided to impose a fine of £10 and costs.

MR. ALAN KING, of Chiswick, was the defendant on three summonses issued by the police at the Chiswick Police Court for, (1) exceeding twenty miles an hour on Good Friday in Chiswick High Road, (2) for driving at a speed dangerous to the public at the same place and time, (3) for failing to notify the London County Council of his change of address. Messrs. Kenneth Brown and Co. defended. A police sergeant and two constables gave evidence to support the charge of driving at twenty-five miles an hour. In cross-examination it was elicited that the sergeant and the constable in charge of the stop watches both started the watches whilst holding them in their pocket. Defendant gave evidence stating that he had in front of him a speed indicator which registered seventeen to eighteen miles an hour and that he knew of the trap and therefore kept within the legal limit. The summons was dismissed. The police admitted, in cross-examination, that speed was the only element of danger relied upon, whereupon it was pointed out for the defence that this was not sufficient in law to warrant a conviction, especially in this case, where the speed had been successfully shown to be moderate. Further, the legal point arose that no one can be convicted twice for the same offence. The Bench advised the police to withdraw this summons. This was done. With regard to the summons for not notifying the Council of change of address, it was submitted no offence had been committed as the last postal address was available, and this was all the County Council stipulated for. The Bench dismissed this summons also.

THE Mobile Motor and Engineering Company, Ltd., of Birmingham, have appointed the Motor Electrical Engineering Company, Ltd., of North Street Garage, Leeds, as their sole district agents.

# THE Motor-Car Journal.

VOL. VIII.]

LONDON, SATURDAY, MAY 26, 1906.

[No. 377.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## THE 1907 EXHIBITION.

In view of the great increase in the output of British and Continental firms, as compared with previous years, as well as the number of new firms entering the industry, every effort has now to be made by those in the trade to bring their productions before the public at the proper season.

Hence the importance of the Motor Car Show at the Agricultural Hall, London, which practically opens the buying season for the year. Spaces for the 1907 display are now being booked, and the new features that will be presented point to an even more successful Exhibition than the record event of 1906.

## COMMENTS.

### An Echo of Brighton.

THE position of the Town Councillors of Brighton, who attracted the Automobile Club to that southern resort by the promise of a tarmac track, is not a particularly enviable one just now. They seem to be assailed from all sides, and the costs which have been incurred are certainly not popular in the town. Meanwhile Mr. J. T. Moore-Brabazon has asked one or two pertinent questions with regard to the disposal of the profits received by the A.C.G.B.I. in connection with the event, and wants to know if there has been any decision with regard to this point. According to him the Club made a very handsome profit out of the meeting held at Brighton. It would be a gracious act on the part of the Committee if they were to pay some of the costs incurred by the Brighton Council, and thus end a matter which may otherwise leave a somewhat sore feeling.

### The Rear Light Question.

THE episode of a tail-lamp in a Lancashire borough, reported on another page, suggests an aspect of the administration of the Motor Car Act which should be carefully considered by the Motor Union. The law makes it incumbent on the motorist to keep his tail-lamp burning brightly; the superintendent of police at Church declares that the condition of the road there was so bad as to shake out the best lights; the magistrates assert that the lamp should remain lighted whatever the state of the road. Amid such conflicting views the motorist in question may congratulate himself on escaping from the penalties usually visited upon those who drive cars. But consideration of the incident in its wider aspect suggests that common sense might well be introduced.

### The Blackpool Footpath.

THE view we expressed with regard to the curious action of the Chief Constable in harassing members of the motor trade of Blackpool has been endorsed by those similarly placed in many of the north-western resorts. Local opinion, too, is against the police action. Of course, if the passage of motor-cars over the pavement constituted a fairly regular breakage of

the flow of pedestrian traffic we would not have a word to say in defence of the motor trader. But no such inconvenience is caused, and, in common with the local organ of public opinion, we "entirely fail to see why the Corporation should desire to put any obstacles in the way of the extensive premises on South Beach being used for the object proposed. Surely, if three or four beautifully equipped and expensive motors do stand on the land in front of the shop, it will not be a tenth part so great a nuisance as the howling pandemonium of swindling auctioneers, sweetmeat vendors, and catch-penny tricksters of one sort and another who will be found not far away. Judging from the cars we saw at the garage yesterday, the gentlemen interested in the new venture have invested a few thousand pounds in motors, and there ought to be no attempt to put these pettifogging restrictions in their way, or to call upon them to fight a costly lawsuit in defence of their rights. Those interested have offered to alter the footpath, and to keep it in repair, at their own cost." Surely, after the criticism that has been levelled at the heads of the authorities, and the sorry figure they cut in Court, common-sense may shortly prevail.

### Motor Ambulances.

SOME particulars of the performances of two motor-ambulances in the service of the Metropolitan Asylums Board will be of interest. The petrol ambulance was delivered on December 16th of last year, and has since run 3,970 miles, and conveyed 250 scarlet fever patients. On one day the ambulance covered 112 miles, and frequently the daily run has exceeded 75 miles. The electric ambulance was delivered on March 5th, and, during the forty days covered by the report presented at the last meeting, this ambulance removed 122 scarlet fever patients and ran 1,282 miles. The electric ambulance travelled much more slowly than the petrol one, and never exceeded 56 miles in one day.

### Railway Rates on Car Bodies.

QUESTIONS of railway charges have an interest for the private owner of the motor-car as well as for the dealers in automobiles. Hence the general importance of the memorial which is now being largely signed at the instigation of the Institute of British Carriage Builders for presentation to the associated railway companies of the United Kingdom. During the last few years the coming of the motor-car has made the present classification of "carriage bodies" inconsistent with the requirements of the industry, and as this governs the rate upon which they are conveyed, the anomalies that have grown up press hardly upon carriage and motor body builders. It is pointed out that the firms in these industries require to convey to various points a partly finished article, which is in the nature of a raw material used by other traders in manufacturing varying articles which are placed in Class 5, the highest for any kind of goods. It is anomalous that the minimum rate per "body," whatever its nature or value, should be 5 cwt. in all cases. For example: that the trader should be called upon to pay the same freight for a light car, weighing

$\frac{3}{4}$  cwt. and valued at £3, as for a landau body weighing 5 cwt. and valued at £50. Several railway companies have recently decided that three light "bodies" can no longer be packed one in the other as a consignment, the effect being to largely increase the rate of freight, which it is suggested might be fairly adjusted by the institution of a separate classification for light "bodies," without which it is feared that traffic in goods of this kind will be seriously reduced, if not prohibited. The memorialists therefore submit that, having regard to the circumstances of the case, the existing classification itself, or the interpretation placed thereon, should be so modified as to allow of the articles in question being given the advantage of more equitable rates and conditions.

#### Commercial Van Trials.

At a meeting of the Committee of the Motor Van, Wagon, and Omnibus Users' Association, held last week, the Trials Committee reported that they had met the Committee of the Automobile Club, and that progress had been made with the preparation of the regulations for the forthcoming trials of commercial vehicles. It is now proposed that the trials shall take place in February and March next, and that the entry list will be closed on November 30th of this year. It is expected that the regulations for the trials, when formally approved by the Automobile Club and the Association, will be issued next month. The van trials have had a chequered career, the interest which was previously awakened and then dispelled being still remembered by those who have followed the history of the automobile. We trust, however, that the announcement now made will actually be realised in due course.

Mr. Wright Anderson on his 12-15-h.p. De Dietrich Car.

#### Frome's Hill.

THE hill climbing competition of the Herefordshire Club, to be held on Thursday, at Frome's Hill, has developed into an event of some importance, and the proceedings at the dinner to be held in the evening at Hereford will recall reminiscences of the Light Car Trial. The contest will have at least one novel feature in the fact that arrangements have been made with the police authorities to report to Mr. Wilfred Groom, the hon. secretary, any case of furious driving by competitors while within the borders of the county, and the proof of these charges will carry with it the disqualification of such contestants. In the open class sixty-seven cars have entered, the drivers including Capt. Masui, Capt. D. H. Morgan, Messrs. G. Usmar, Clifford Earp, E. H. Lancaster, P. Brodtmann, C. Jarrott, C. Friwell, E. E. Leverett, H. C. Holder, G. H. Woods and other well-known motorists, while several cars new to the competitions in this country will make their debut.

#### Mr. Burns on London Traffic.

IN view of the important position he now occupies with the Department that is nearest the regulation of motor matters from the administrative point of view, the contribution of Mr. John Burns to the current "Pall Mall Magazine" is of special interest to all who are studying the tangle of London's traffic. He regards the report of the Royal Commission on the subject as "a palpable hint to the present Government to co-ordinate, unify, consolidate and vest in one body the scattered duties now imperfectly discharged" by a dozen authorities and innumerable companies, to the derangement of traffic and the entrenchment of the streets against the citizens of the capital city of the empire. Mr. Burns rightly insists that the widening of roads is useless, and that it is a waste of money to construct tramways unless the whole problem is taken in hand with the view of being dealt with on a broad and adequate plan. The value of the Strand and Regent Street is lessened by the way in which their approaches and thoroughfares are allowed to be congested.

#### Tramcars v. Motor Buses.

WHILE, however, there is much common sense as well as picturesque phrasing, the article is vitiated by an exaggeration of the tramway, as though it were to be the avenue to a delectable country of freely moving traffic. The rapidity with which the motor-bus has come along, the lessening of noise and smell which is already marking its advance, and its ubiquity of motion, should have led Mr. Burns to some other conclusion than the declaration that "for housing, pleasure, trade, health, and the reduction of time wasted by the mere size of cities, tramways are the only, as they are the cheapest and best, remedy and solution." This seems too conclusive and sweeping an assertion, and one which overlooks the advantage that must be obtained by any form of traffic that can move without restrictions imposed by specially laid tracks, and which can glide among the sinuous streets of our overgrown cities, where tramways would be instruments of annoyance and positive danger.

#### The Auto Cycle Club's Eliminating Trials.

THE difficulty in which the Auto Cycle Club was plunged when the Tourist Trophy Race was postponed to September has been overcome by the thoughtfulness of Lord Derby, who, doubtless owing to the good offices of the Hon. A. Stanley, has consented to allow that organisation to hold its eliminating trials for the International Cup Race in Knowsley Park. The course that will be marked out for the event is a circular one of four miles or thereabouts, with plenty of sharp corners, some of which may possibly be regarded as controls. For purposes of testing the speed of the cycles, a run of five miles will be available in another part of the park, and, all things considered, the track should result in the selection of riders well able to sustain national renown in the international event. The trials will take place on the 6th prox., and will, of course, be conducted in semi-privacy. The following entries have been received:—H. A. Collier, 7-h.p. Matchless; C. R. Collier, 7-h.p. Matchless; G. A. Barnes, 8-h.p. Barnes; C. B. Franklin, 7-h.p. J.A.P.; T. Silver, 6-h.p. Quadrant; V. Feeney, 7-h.p. Westlake; R. Marewood, 6-h.p. Westlake.

#### Loyal Lowestoft.

EVIDENTLY the automobile education of the councillors of Lowestoft has been thoroughly looked after by the motorists of the town, or those gentlemen have a larger supply of common sense than is to be found in many council chambers. The question raised by the St. Albans Rural Council with regard to watering the dust came before them at their last meeting, and was discussed in a way that did credit to the town. Mr. L. F. Orde confessed that he had been a great sufferer from the dust raised—not made—by motor-cars, but he

could not agree with the proposal to more heavily tax cars in order to water the roads. Dr. Walker made a really excellent plea on the use of motor-cars for medical men, testifying to his activities of the previous year having been impossible but for his car. Mr. Brooke, whose name is identified both with the progress of Lowestoft and the advance of the motor-car, rightly ridiculed the idea that water would solve the problem, and asserted that such was the way to ruin the roads. Ultimately the resolution to reject the proposition from St. Albans was adopted by a large majority; and we trust the friendly disposition which Lowestoft has always shown to the motor-car will find reward in the prosperity associated with motorists as visitants.

#### The Tourist Trophy Race.

ELSEWHERE we give a list of the entries which have been received for the International Tourist Trophy Race up to the time of going to press. We are asked by the A.C.G.B.I. to remind the trade that the last day for the receipt of entries at the ordinary fee of £20 per car is the 27th prox. After that

makers of the steam car are anxious to match their vehicles against the petrol cars, but the difficulty of handicapping with a view to secure equality of treatment is an obstacle which has thus far surpassed the wit of man. Meanwhile the minority of the steam car makers maintain a vigorous agitation for inclusion in trials and races, and one or two, at least, find satisfaction in the interest with which their particular vehicles are regarded by prospective motorists.

#### Scottish Notes.

In view of the importance which Scotland will assume during the next few weeks in the automobile world, special interest attaches to everything of motor-ing concern from north of the Tweed. There is likely to be considerable motor-car traffic northwards during June, and motorists themselves do not always despise the rail when anxious to cover the maximum of distance in the minimum of time. We would, however, urge upon all our Scottish readers who have influence in the necessary quarters, the desirability of arousing official opposition to the growing practice of laying police traps. There was a

The Italian Coppa d'Oro Touring Contest. The Competitors arriving at Rome. (See page 281.)

date the fee will advance £2 per week until August 27th, after which no entries will be received. The race will take place on Thursday, September 27th, and the whole object of the Club in fixing a definite allowance of fuel for a given distance is simply to limit the horse-power, and thereby the speed, of the competing vehicles. The regulation, in conjunction with the others, restricts the race to *bona fide* touring cars. This method of limiting engine power was chosen on account of its simplicity. The allowance of petroleum spirit for this year's race has been fixed at one gallon for every 25 miles of the course.

#### Steam v. Petrol.

THE A.C.G.B.I. has announced its intention to hold a steam-car trial if sufficient support is promised from the makers of such vehicles. Unfortunately no satisfaction has yet been accorded to anyone in this connection, and it is doubtful whether this attempt of the Club to bring about a match between the various types of steam cars now on the market will be welcomed by those directly responsible. The

time when Sir John Macdonald, Mr. R. J. Smith, and others, who have assisted the movement in the north, could come southwards and picture a land free from such devices. Stands Scotland where it did? The answer will be found in our Scottish Notes on another page.

#### The Motor Cab.

HAVING been duly installed on a rank in Trafalgar Square, London, the motor-cab may now be said to be on the highway to popular service. In fact, its entry into Palace Yard on Monday apprised legislators of the coming of new force among the crawling hansoms of the City. On that day Mr. Henry Norman drove a Renault motor-cab into Palace Yard, thus conveying Sir Christopher Furness to his duties in the House. The cab was fitted with a taximeter, a device that was denounced by the president of the Cab Drivers' Union, in giving evidence before the Select Committee now examining witnesses with regard to the Metropolitan cab regulations, on Tuesday.

**Club Events.**

SATURDAY was a busy day with the clubs, and our pages this week reveal an activity that spells profit for the industry and pleasure for a large number of people. Competitions and trials were held in almost every important automobile district, and the difficulties of recording all with adequate space according to the importance of the events has been greatly multiplied this season. It is an interesting sidelight on the development of a movement which is rapidly advancing to universal adoption.

**A Conference Proposed.**

A MEMBER of the Islington Borough Council is proposing that a conference of all the authorities concerned with the government of London shall be called for the purpose of promoting legislation jointly with the London County Council for "dealing with the problem of motor traffic in London." Herein we see the parochial attitude demonstrated in a very innocent way. It is not specially to look after the motor-vehicle that future legislation must be invoked; the motor-car is but a fraction of the vehicular confusion of our streets, and any conference that is called must have a wide range if its deliberations are to be regarded as of permanent value. Traffic in London must not be looked upon in a sectional aspect; it must be considered in its entirety, with, of course, a view as to future developments as well as the immediate needs of the occasion.

**Water v. Tar.**

LAST week we referred to the suggestion of some Romford wiseacres to the effect that a satisfactory method of dealing with the dust nuisance would be to water the surface of the roads, such idea being in complete ignorance of the fact that any reform must depend on the foundations of the highway. When we wrote we hoped that the suggestion of the Romford people was an isolated one; now, however, we learn that the Cheshire County Council has resolved to recommend the raising of the charge for the registration of motor-cars, with a view to expending the money thus obtained in watering the roads. If this is all a county council can suggest on such a matter, we are afraid for the wisdom of its proposals in other directions. The Kent authorities, however, seem to have shown a keener appreciation of the matter, and have come to the conclusion that the only "unobjectionable and economical method" of dealing with the dust nuisance is the tar treatment. This is certainly more efficacious than flooding the roads with water.

**A Central County.**

FROM its central position the county of Northamptonshire is known to most English motorists who travel the pleasant highways of their own country. Its gradients are fairly easy, and the road surface generally good. The road from London to Chester follows the old Watling Street through Northamptonshire for nearly seventy miles, entering the county at Old Stratford, and passing through Towcester. In his capital little guide to the district, which Messrs. Methuen and Co. have just published, Mr. Wakeling Dry also enumerates the London to Derby road, entering at Horton and going by way of Northampton into Leicestershire, and that between the capital and Nottingham *via* Rushden and Kettering. The Great North Road passes through the neck of the county at the quaint village of Wansford and runs to Stamford; and other main roads are those from Northampton to Peterborough; to Stamford through Kettering; to Brackley and Oxford through Towcester; and to Bedford. Mr. Dry is a pleasant literary companion, and his outlined trip of 140 miles through the county will add to the interest of his book, so far as the busy motorist is concerned.

**Horses and Cars.**

THERE is something so unique about the latest announcement emanating from Messrs. Withers and Co., Ltd., the well-known jobmasters, that we would make special reference thereto, in the hope of reassuring horse owners that the Equine Museum is not yet to be founded. Since 1830 the firm have been dealing in horses; they have now, "in response to the growing demand for motors as well as for horses," converted part of their premises into a motor garage, and are about to introduce the "Withers" chassis to the public. At the same time they wish particularly "that it should be understood that it is not their intention to relax their attention to their jobmasters' business. The monthly hiring of carriage horses will also be continued as before, with or without forage, shoeing, and stabling." To this feature of their business is being added the hiring out of cars, with "suitable charges for washing, polishing, lubricating, and filling the tanks with petrol." This equality of interest in horses and motor-horses seems to suggest a variation of the phrase as to the lion and the lamb dwelling together in amity.

**Methods of the L.C.C.**

EARLY in the year we commented upon the extraordinary form of licence issued by the London County Council, with its blank pages for the endorsement of anticipated offences. The whole form has been severely criticised, and also the procedure necessary at Spring Gardens for obtaining licences and registering cars. Now that the Touring Committee of the A.C.G.B.I. has given the matter consideration with a view to laying the whole subject before the Highways Committee of the L.C.C., we hope that readers who are known to members of that body will make the position clear to those whom they can influence. The travelling up and down associated with paying licence fees is neither dignified nor necessary, however useful it may be as a form of exercise. It may seem a detail, but when repeated by thousands of people in the course of a few months it amounts to a great waste of time—to say nothing of the irritation aroused.

WITH this issue appears the Index to Volume VII. of the *M.C.J.*, which is now in its eighth year of publication.

THE Brouhot Motor Company of Great Britain, Ltd., have just delivered to the Earl of Lonsdale a 40-h.p. Brouhot car.

THE municipal authorities of Bucharest, Roumania, are in the market for a motor-ambulance at an estimated cost of £800.

MESSRS. DENNIS BROS., LTD., have just received an order for six 'bus chassis for Messrs. Thomas Tilling, Ltd. The order is the result of the 9,000 mile trial recently given to this firm of 'bus proprietors.

WE learn that a new type of Mercedes car has just reached this country. It is of 40-50-h.p., the engine of which has the inlet and exhaust valves located on opposite sides of the cylinders. Among other changes are a new carburettor and an improved form of dashboard lubricator.

THE Standard Motor Company, Ltd., Coventry, last week despatched at very short notice one of their 24-30-h.p. six-cylinder cars to Montreal. They only received the inquiry by cable on Saturday, the 12th inst., immediate delivery being specified, and being in a position to give they replied to that effect, and received the order on the afternoon of the 14th. The car was at once packed for shipment, and left Coventry the next day.

AN interesting consumption trial was carried out on the 5th inst. by the Automobile Club of America. The competitors after emptying the fuel tanks of their cars were given a sealed two-gallon tin of petrol, and, travelling over a pre-determined course, the object was to see which vehicle could cover the greatest distance. Sixty-five vehicles took part in the event, the first place in which was taken by a Franklin 12-h.p. four-cylinder car which is stated to have travelled no less than eighty-seven miles on the two-gallon allowance.

# The Westinghouse Car.

**I**N addition to the Peugeot cars, Messrs. Friswell, Ltd., have secured the sole British and Colonial agency for the cars made by the Westinghouse Company, at Havre, France, and the other day we had an opportunity of inspecting the first chassis to reach this country. It is of 30-40-h.p.—the only size at present being turned out—and, as will be seen from the accompanying illustrations, it follows in design the general lines of chain-driven vehicles. The frame is of pressed steel construction, supported by unusually long springs on equal-sized road wheels. The engine comprises four cylinders, 120 mm. bore by 130 mm. stroke, cast in two pairs. The valves are all mechanically actuated off separate cam shafts, the inlet valves being on the right and the exhaust on the left. The mixture is furnished

the engine is maintained by a Dubrulle mechanical oiler, driven by an eccentric off the motor itself.

Passing now to the transmission, the clutch, which is of the metal-to-metal disc type, is so arranged that it can be removed without interfering with the engine or the gear-box. The latter is adapted to give four speeds and a reverse with direct drive on top speed. The single controlling lever works in a "gate" quadrant. From the differential shaft the power is conveyed to the rear road wheels by side chains. Two foot-brakes are provided operated by separate pedals. One acts on a drum on the differential shaft, and the other on one at the forward end of the side shaft of the gear-box; both brake drums are water-cooled, the water being automatically turned on as the pedals

Figs. 1 and 2.—Elevation and Plan of Chassis of Westinghouse Car.

by a special form of automatic carburettor provided with two self-regulating air inlets. At low speeds only one of these opens, but when the engine is running fast the second valve is brought into action. The normal rate of the engine is 1,000 revolutions per minute, but by means of a lever on the steering wheel the speed can be regulated between wide limits, an accelerator being provided to cut the governor out of action when desired. The ignition is by low tension magneto, the make and break tappets being operated off the inlet valve cam shaft. The water circulation is maintained by a gear-driven pump and a honeycomb radiator, a current of air being drawn through the latter by the arms of the flywheel, which are made to act as a fan. The carburettor, magneto, and pump are all mounted directly on the engine. The petrol is fed to the carburettor under pressure from a large tank at the rear, while the lubrication of

are pushed forward. In addition, a hand lever at the side controls internally-expanding brakes working inside drums connected with the hubs of the rear road wheels. The axles are of H section steel, the rear one being dropped. A feature of the car is the employment of an aluminium dashboard. Ball bearings are used throughout except on the engine. The car has a wheel base of 10 ft. and a track of 4 ft. 7 in. Altogether the Westinghouse car makes a favourable impression, the workmanship well upholding the reputation of the company in other branches of engineering work.

THE value of the exports of automobiles and parts from the United States during March last amounted to £56,712, as against only £47,165 in the same month of last year.

## SOME CURRENT TOPICS.

### The Popularity of Motor-Cycling.

Far from declining, as has been frequently prognosticated, motor-cycling seems, to use a popular phrase, to be going very strong, the ubiquitous motor-bicycle turning up in many unexpected places in the course of our motoring journeys. A few years ago quite a boom set in as regards the manufacture of such machines, practically every large cycle-making concern in the country taking up their construction. The natural course of events—an increase of production over demand—quickly ensued, with the result that many concerns dropped out of the business, and even out of existence, the venture into the lighter branch of the automobile industry having proved anything but profitable. While there is no question that the British output of motor-cycles is less than that of a year or so ago, it by no means follows that the pastime is a waning one. Indeed, there is indisputable evidence to the contrary, for, on the one hand, the few concerns which have continued to cater for the

gradually evolved. As regards his racing career, M. Renault remarks that he will long remember his participation in the Paris-Toulouse race with a  $4\frac{1}{2}$ -h.p. car, the engine lubricator of which was broken at the start, and in which event his maximum speed for the 500 mile run was under twenty miles an hour. Paris-Vienna, too, will not be quickly forgotten, for in that memorable contest he had to practically rebuild the rear axle and one of the road wheels on the roadside.

### Remagnetising a Magneto.

In our correspondence columns this week, a writer who signs himself W. H. H. raises a somewhat interesting query as to remagnetising a weakened magneto, an operation which can be carried out provided that the proper apparatus is available for the purpose. To remagnetise a steel magnet, it is necessary to saturate it with magnetism, and this can only be done by keeping it in a magnetic field for a suitable period of time. To do this, two bobbins containing windings of wire are necessary, made of sufficient dimensions to enable them to be easily slipped over the two poles of the magnet. A current has then to be passed through the windings, producing a magnetic field in the interior of the bobbins, which will gradually saturate the steel of the magnet and restore it to its original strength. As soon as the current is

A Bend in the Course at Ardennay.

The Village of Bouloire.

VIEWS ON THE SARTHE CIRCUIT ON WHICH THE RACE FOR THE GRAND PRIX DE L'A.C.F. WILL BE HELD.

demand report an excellent current business, while, on the other, the importation of foreign-built motor-cycles into this country is at present on a larger scale than at any previous time, and is, moreover, showing a steadily increasing tendency. From the import returns we find that during the four months ending with April last no less than 805 complete machines were imported, the value being £22,610. Motor-cycle parts were responsible for a further £9,951, giving an aggregate of £32,561, as contrasted with only £25,186 in the corresponding period of last year, and £22,681 in the first four months of 1904.

### The Origin of the Renault Car.

M. Louis Renault has given some interesting particulars of the origin of the Renault cars in one of our French contemporaries. Right from boyhood he had a great penchant for mechanics, and he was still in his teens when he built his first experimental voiturette. Although only fitted with a  $3\frac{1}{2}$ -h.p. engine, the little car ran so well that within a very short time he had received orders for twenty similar vehicles. To turn these out he and his brothers set up a small factory at Billancourt, France, from which the present huge establishment has

passing round the circuit, it will be found that the magnets are strongly magnetised, but this is only due to the presence of the magnetic field, and if the bobbins were withdrawn the strength of the magnets would disappear. It is, therefore, necessary to keep them in the magnetic field for a considerable time, varying from, perhaps, thirty to fifty hours, according to the strength of the field, which in turn depends upon the number of windings of wire on the bobbins and the strength of the current passing through the circuit. In arranging the latter, care must be taken to make the direction in which the current is flowing suitable to the poles of the magnet, so that the weakened north and south poles of the magnet are put into magnetic fields which will keep the same polarity on each pole. For various reasons it is better to have this done by an electrician, to ensure satisfaction.

MESSRS. MANNING, WARDLE AND CO., of Leeds, who are completing an order for a number of steam rail motor-coaches for the Taff Vale Railway Company, have recently entered into contracts to supply four steam rail motor-coaches for the Great Northern Railway of Ireland and two similar self-propelled cars for the Dublin, Wicklow, and Wexford Railway Company.

## THE ITALIAN COPPA D'ORO TOURING COMPETITION.

THE Coppa d'Oro touring competition organised by the Automobile Club of Milan, which commenced on Monday, the 14th inst., has been in progress during the whole of the past week. The very long daily journeys and the hilly nature of the course to be covered render the contest by far the most severe that has so far been held, and in view of this the news that the weaker cars were quickly out of the running will not prove altogether a surprise. At the same time it must be admitted that the withdrawal of certain of the competitors was due to sheer bad luck, in one case at least a driver heading his vehicle into the ditch to avoid a collision. Out of the forty-eight who started in the event only eighteen reached Milan at the end of the eighth day's run. The English, and, in fact, all the foreign cars are at a great disadvantage in one respect, as the Italian competitors have their own depots at various towns, and any adjustments necessary can be executed there by skilled workmen while the drivers are waiting for the minimum time allowance to expire; on the other hand, the foreign competitors have to rely

153 miles, and, as compared with the previous day, over a relatively easy course. The bad weather, however, continued, rendering travelling anything but pleasant and easy. Both the Napier cars met with slight delays, the one driven by Glentworth on account of tyre troubles, and that in charge of Macdonald by a collision with a dog. The latter, however, again succeeded in arriving first. The day's run was unfortunately marred by an accident which has had fatal results. De Pasquali, who was driving a Benz car, had a nasty skid near Sessa Aurunca, as a result of which his car overturned. He was quickly taken to the hospital, but, although he lingered for a couple of days, he eventually succumbed to his injuries. M. De Pasquali, who was the Milan agent for Benz cars, was an enthusiastic motorist, and his death has cast a gloom over the trials. Other competitors who fell out on the day's run were Marsaglia (Zust), Cariolate (on a Rapid, owing to a broken road wheel), and La Manna (Diatto-Clement). Thus thirty-one out of the thirty-five cars which left Rome in the morning safely reached Naples.

The return to Rome from Naples was made on the 17th inst., when, out of the thirty-one cars which started, all but three

The Cars arriving at Bologna.

on their own resources. Notwithstanding the large area comprised in the trial, the organisation has met with universal approval. The most dangerous spots have been heralded in advance, men being stationed at numerous points of the long route with boards on which the nature of the particular danger is shown by means of arrows, curved to follow the exact direction of the approaching corner.

Bad weather was encountered on the second day's run on the 15th inst.—from Bologna to Rome, a distance of 282 miles. Forty-one cars started, and of these thirty-five finished the day's journey. Macdonald (Napier) was the first to be sent away, Grigg, who had met with an accident on his Daimler on the previous day, being unfortunately unable to start. Not only was the trip a difficult one as regards length, but it abounded with many sharp corners, and furthermore including a number of steep ascents. M. L. de Dion's car was placed *hors de combat* by a collision with Lanfranchi's Otav. The latter was, however, able to continue. Other competitors who failed to arrive were Galli (Florentia), Raggio (Marchand), Spinneli (Florentia), Tamagni (Marchand), and Bussolotti (Diatto-Clement). On the 16th inst. the run was from Rome to Naples, a distance of only

reached the Italian capital, notwithstanding the heavy rain. passed through and the muddy roads which had to be traversed. Tomasselli experienced a bad skid and ran into a bank; the axle of his Bianchi car being damaged, he was forced to abandon. Basevi (Diatto-Clement) and Beutler (Martini) are also out of the running, having exceeded the maximum time allowed for the day's journey. On Friday, the 18th inst., twenty-eight cars left Rome for Florence, a journey of no less than 232 miles—a difficult task in itself, but one which was rendered extremely arduous by reason of the fact that several passes had to be traversed and many dangerous corners negotiated. Notwithstanding this, however, the day's proceedings may be regarded as one of the most satisfactory, as all but one competitor—Coquard (Aries) safely reached Florence within the specified time. The journey on Saturday was again a long and difficult one; it was from Florence to Genoa, 272 miles. During the run the competitors had to climb passes as high as 6,000 ft., while towards the end of the day there was a thirty-mile downhill run along an ever-winding road to sea level. Twenty-seven competitors set out in the morning, of whom twenty-three were duly entered in at Genoa. Of the four

missing ones it is reported that Giovanzani (Isotta-Fraschini) retired at the start of the day's run, Graziani (Itala) gave up at Pistoia, Ceirano abandoned owing to a broken axle which his Rapid car sustained at one of the nasty corners, while Cormier (De Dion) ran into a ditch to avoid a team of mules. After some delay he got his car going again, but arrived ten minutes after the control had closed.

The position of the various leading competitors in the contest at the end of the sixth day's run is as follows:—

	Driver.	Car.	Penalisation over minimum time allowed.	
			min.	sec.
1.	Lancia ... ..	Fiat... ..	0	0
2.	Trucco ... ..	Isotta-Fraschini ...	0	2
3.	Maggioni ... ..	Zust... ..	0	7
4.	Cagno ... ..	Itala ... ..	0	10
5.	Nazzaro ... ..	Fiat... ..	0	35
6.	Boschis ... ..	Fiat... ..	1	27
7.	Fraschini ... ..	Isotta-Fraschini ...	1	38
8.	Macdonald... ..	Napier ... ..	2	22
9.	Boessano ... ..	Benz ... ..	4	28
10.	Glentworth ... ..	Napier ... ..	6	51

The journey on Sunday—from Genoa to Turin, 280 miles—although a long one, was not so difficult as some of the preceding trips. Of the twenty-three cars which left Genoa in the

A Trio of Winton Cars at a Pretty Spot near San Francisco.

morning, twenty safely reached Turin, where a large crowd welcomed the visitors. The three competitors who had not arrived when the control closed were Renaud (Mercedes), Gremo (Isotta-Fraschini), and Bosio (Diatto-Clement).

Bad weather was again encountered on Monday, when the run was from Turin to Milan. The rain came down so heavily and persistently that most of the drivers and passengers were wet to the skin long before they arrived at the journey's end. The trip was relatively a short one—142 miles—and consequently, instead of starting as usual at 4.30 a.m., the competitors were allowed a welcome rest, they not being despatched on their way until 10.30 a.m. The number of competitors was reduced during the day to eighteen, owing to the retirement of Lanfranchi (Otav) and Trucco (Isotta-Fraschini). Up to the end of the seventh day the last-named had done exceedingly well, taking, in fact, the second place, only two seconds separating him from Lancia, who is still at the head of the list, and who, barring accidents, is regarded as the winner of the event. The two Napier cars are still maintaining the British reputation in the contest. Apart from the tyres the vehicles have given practically no trouble, and their excellent behaviour has created a good impression.

A SPLENDIDLY equipped motor garage has been opened by Mr. F. C. Wallace in the London Road, Bath.

## THE ARIES AND GREGOIRE CARS.

THE other day we had an opportunity of going over the large new depot which Messrs. Osborn and Co. and Aries, Ltd., have jointly established—the interests of the two concerns being practically identical—at 6, Great Marlborough Street, London, W.C., for the sale of Gregoire and Aries cars. For some time past the premises have been in the hands of the builders and decorators, who have converted the ground floor into a spacious showroom, while a lift has been installed by means of which cars can be quickly conveyed to the basement, where washing and other facilities are available. Here, too, a supply of spare parts for both the Gregoire and Aries vehicles will be kept on hand ready for despatch at the shortest notice to any user. While arrangements are being made to permit of the carrying out of small repairs and adjustments at the Great Marlborough Street depot, the more important repairs, as regards the Gregoires, will be dealt with at the works at Shepherd's Bush, and in connection with the Aries cars at Reading, where the chassis as they arrive from the factories are tested and *mis au point*. At the time of our visit the depot, which is in charge of Mr. H. G. Norris, who has had considerable experience in motor work, was somewhat bare of cars, the labour troubles in France having considerably interfered with deliveries. By the end of next month, however, it is hoped to have examples of the various models of each make on view.

The Aries cars, which have already been described in the *M.C.J.*, are made in no less than six sizes—14-h.p. two-cylinder, 15-h.p., 22-h.p., 30-h.p., 35-h.p., and 50-h.p. four-cylinder. The vehicles, which enjoy an excellent reputation in France, are of the chainless type, their notable feature being the arrangement of the live axle, which has only the driving effort to transmit, the weight of the car being carried by a separate fixed axle. Coming now to the Gregoire cars, we learn from Mr. Fred. J. Osborn, whose connection with the motor trade dates from the early days of the 1896 Act, that quite a number of new developments are in hand. The 8-h.p. two-cylinder car is now being made in two lengths of chassis, one being adapted to receive two, three, or four-seated bodies, and the other being intended for a side-entrance car. Messrs. Gregoire are also now turning out several sizes of four-cylinder cars, for, in addition to the 15-h.p. vehicle which made its *debut* in this country at the recent Cordingley Show, a new 20-h.p. chassis is shortly expected. Perhaps the most interesting departure, and certainly one which will appeal to motorists of moderate means, is a Gregoire car fitted with a four-cylinder engine of 8–10-h.p. For some time past there has been a growing demand for a reliable little vehicle fitted with a four-cylinder motor, and we are looking forward to the arrival—about the middle of July—of the first of the new chassis with interest. Starting in a modest way at Poissy—about twenty miles from Paris—by building an 8-h.p. two-cylinder car, Messrs. Gregoire are rapidly forging their way to the front as a leading firm of automobile constructors. They have already competed in a number of trials with success, and have now set out upon a more ambitious campaign by entering two 75-h.p. racing cars for the forthcoming contest for the Grand Prix de l'A.C.F.

MR. J. K. HEARD, the proprietor of the Taunton Motor Company, is lending motor-cars on hire. His garage is East Street is lighted by electricity and he holds a large stock of accessories.

THE new catalogue of Messrs. Timson Brothers gives a good idea of the capacity of the firm to deal with the requirements of all classes of motorists, their range of accessories being extremely comprehensive.

ELSEWHERE in the present issue we illustrate a 28–36-h.p. Daimler car recently supplied to Mr. J. D. Lonsdale, Blackburn, by Atkinson's Central Motor Garage, Accrington, the vehicle being one of ten Daimlers ordered by local gentlemen from this concern during the present season.

## CONTINENTAL NOTES.

### The A.C.F. Grand Prix Race.

The entries for the race for the Grand Prix de l'A.C.F., which is to be run on the Sarthe Circuit on June 26th and 27th next, have now been definitely closed. As will be seen from the following table, there are altogether thirty-four competitors, of which twenty-five are French, six Italian, and three German:—

No.	Car.	Driver.	No.	Car.	Driver.
1.	Darracq...	Hémery.	19.	Hotchkiss	Salleron.
2.	Darracq...	Wagner.	20.	Hotchkiss	Fitzshepard.
3.	Darracq...	Hanriot.	21.	Itala	Cagno.
4.	Panhard	Heath.	22.	Itala	De Caters.
5.	Panhard	Teste.	23.	Itala	Fabry.
6.	Panhard	Tart.	24.	Fiat	Lancia.
7.	Brasier	Baras.	25.	Fiat	Nazzaro.
8.	Brasier	Lebrun.	26.	Fiat	Weillachott.
9.	Brasier	Barillier.	27.	Bayard-Clement	A. Clément.
10.	Dietrich...	Gabriel.	28.	Bayard-Clement	Villemain.
11.	Dietrich...	Rougier.	29.	Bayard-Clement	Touloubre.
12.	Dietrich...	Duray.	30.	Gregoire	De Bosch.
13.	Gobron	Rigoly.	31.	Gregoire	Tavenaux.
14.	Vulpes	Barriaux.	32.	Mercedes	Jenatzy.
15.	Renault...	Siez.	33.	Mercedes	Mariaux.
16.	Renault...	Edmond.	34.	Mercedes	Florio or Braun.
17.	Renault...	Riches.			
18.	Hotchkiss	Le Blon.			

Some surprise has been expressed in France at the absence of any British entry. Belgium, Austria, and the United States,

tion of fuel and water, speed on hills, average speed, and price of chassis. The entries so far include a Peugeot (the holder of the cup), four Rochet-Schneders, a Lorraine-Dietrich, a Brouhot, and a Cottin-Desgouttes.

### The Tour of France.

The tour of France for motor-bicycles, tri-cars and voiturettes, organised by the Autocycle Club de France, commenced on Tuesday last, and will continue until the 3rd prox., during which time the competitors will practically make a circuit of the country. The thirteen daily runs range from 80 to 158 miles, and the rules provide for a maximum average speed of 18½ miles per hour. In the light motor-bicycle class there are nine entries, seven in the third of a litre motor-bicycle category, seventeen in the tri-car section, and nineteen in the voiturette class.

### A Non-Skidding Competition.

An international competition of non-skidding devices is to be held in France on August 2nd. Full particulars of the event can be obtained from M. J. Bourcill, Saint-Chaffray, 35, Rue Bergere, Paris.

### The Labour Troubles in the French Motor Industry.

The strike of workmen at the motor-car factories in the Paris district is now virtually at an end, the majority of the employees having resumed work on Tuesday of last week. As a result of the disturbance to production, the masters are forming

Motor-Buses in Vienna.

The motor-bus has now been introduced into the Austrian capital. Although the chassis is identical with the German Daimler vehicles in service in London, the novel construction of the bus bodies gives them a strange appearance. [Allgemeine Automobil Zeitung]

which have competed in the Gordon Bennett races in the past, have also abstained from entering the Grand Prix event, which the French Club have brought forward as a substitute for the old Cup contest. It has been decided that the race shall commence at 6 a.m., and that the competitors will be despatched at intervals of a minute and a-half. The entire course is being tarred on the Lassailly system by La Société Generale de Goudronnage des Routes.

### The Paris-Tourcoing Industrial Vehicle Competition.

The arrangements for the competition of industrial vehicles, which the Automobile Club du Nord de la France will hold from June 6th to 17th next, are well in hand. So far twenty-seven cars have been entered, these comprising three Latil *avant-trains*, two Auto-Camions, a Janvier six-wheel lorry, a Louet, a Mors, a Prunel, three Clément Bayards, three Contal motor tri-cars, three Eugene Brillies, a Delahaye, three Guillermeres, a Turgan, an Aries, two Peugeots, and a d'Espine.

### The Rochet-Schneider Cup Contest for Touring Cars.

The annual competition for the Rochet-Schneider touring-car trophy is this year to be held on June 4th, over the 1905 Gordon Bennett course in the Auvergne, the distance to be covered being 300 kilometres. The event is open to four-cylinder touring cars, and the awards are made on a point basis, marks being awarded for regularity of running, consump-

an employers' association, and a fund to which each will contribute a sum equal to 2 per cent. of the annual wages paid.

### Miscellaneous Items.

The East Switzerland Motor Cycle Union is organising a 300 kilometre reliability trial for motor-cycles for the 27th inst. The route is from Weinfelden to Basel and back.—The municipal authorities of Zurich have, it is reported, decided not to allow motor-cars fitted with non-skids to the tyres to run in the city, on the ground that such devices cause the dust to rise.—A motor cycle race for the Coupe de Normandie is to be held on June 24th over a 165 kilometre circuit, starting and finishing at Caen. The total distance to be covered is 165 kilometres.—A proposal brought forward by the German Club to postpone the Circuit Europeen until next year is being considered by the International Automobile Commission.—Motorists in Algiers are complaining to the local municipal authorities of the high-handed manner of the police in dealing with motor-car traffic, summonses being issued on the slightest provocation.—A hill-climbing competition was held on Sunday last on the Platieres Hill, near Aix, under the auspices of the Marseilles Automobile Club. The fastest time of the day was made by M. Fabre on a Berliet, he making the climb in 37 sec.—The entries for the Herkomer Touring Trophy contest to date number 160.

## SCOTTISH NOTES.

INTEREST in the forthcoming Reliability Trials is developing rapidly, and, with eighty vehicles upon the road, the duties of the officials will be particularly onerous. Among the entries are half a dozen cars with six-cylinder engines, fifty-seven with four-cylinders, twelve with twin-cylinders, and five one-cylinder motors. Whereas the entries last year were equally divided between those of British and foreign origin, this year the proportion in favour of the national make is increased, there being no fewer than fifty-three English and Scottish cars entered.

At a meeting of the Paisley Town Council it has been reported by a sub-committee, to whom the matter had been remitted, that in their view the speed of motor-cars should be limited to ten miles an hour between Hawkhead Road and Ferguslie, between the Cross and Potterhill, between the Cross and Abercorn Station *via* Weir Street, between the Cross and Springbank Road *via* Love Street, and in Moss Street. The recommendation of the committee was adopted by the Council, and application will probably be made to the Secretary for Scotland.

Lord Killanin on his new Argyll Car.

Lord Killanin called recently at the Argyll Works, Alexandria, N.B., to take delivery of his new 16-20 h.p. Brougham, afterwards starting with his driver for a 300 miles tour in the Highlands. During the trip the ascent of Glen Croe was made from both Arrochar and Inverary in a storm of wind and rain, and on his return his Lordship expressed his great satisfaction with the car. The vehicle is provided with a detachable-top brougham, painted dark blue with light blue lines, dark blue upholstery, and nickel fittings.

DURING the recent Glasgow Motor Show the representatives of various exhibiting firms took advantage of the opportunity to test their cars on some of the steepest hills to be found within a day's run of the city. A favourite test hill was that leading from Arrochar, at the head of Loch Long, through Glen Croe, *via* the Rest and Be Thankful hill, to Inverary. At the time the roads were at their worst, being softened by the winter's snow and rain. Mr. David Russell, of the shipowning firm of David Russell and Co., Edinburgh, made the same ascent three days later, when it was blowing half a gale of wind, and not only reached Rest and Be Thankful, but went down the other side, lunched at Inverary, and came back to Tarbet Hotel, where he was staying for the week end. This was done in his 16-20-h.p. "Argyll," and was also accomplished with five passengers, averaging 12 stones each in weight, in the car all the time.

AMONG the projected automobile services for the coming season is one between Tomintoul and Grantown. The former place has interest as being the highest inhabited village in Britain. As was the case last year, it is on the route of the Scottish Reliability Trial.

WE hear that the Engineering Laboratory of the Heriot-Watt College, Edinburgh, is being equipped with a view to the

development of the automobile side of the work, in which Professor R. Stanfield, M.I.C.E., has always taken a keen interest. It is his intention to start a course in motor-car engineering for owners, users and drivers, the curriculum consisting of lectures, laboratory work and drawing office practice. The syllabus has been carefully prepared and should become a model of its kind. Doubtless many of the motor-car engineering firms will see the wisdom of lending engines during the term, and Professor Stanfield should have full support in his laudable effort to secure a really complete course of instruction for those interested in motoring.

A NEW motor-omnibus service has been established by the Great North of Scotland Railway Company between Alford, Kildrummy and Strathdon. Now it will be possible for passengers from Aberdeen to visit Strathdon and return the same day. This has not been practicable hitherto.

THE police trap is becoming as ubiquitous in Scotland as in the southern counties. That in Prince's Street, Edinburgh, has already been reported. Others in active operation are at Stonehaven and at Ayr, the latter being a furlong in length and located in the St. Leonard's Road. The views of Sheriff Robertson with regard to these traps, as reported on another page, will be of interest to all in the habit of touring in the northern part of Britain.

SUPPLEMENTING the short account in last week's issue of mountain climbing by motor-car, the following notes, supplied by Captain H. H. P. Deasy, will be of interest to those who contemplate travelling over the steep hills between the head of Loch Striven and Otter Ferry. The sharpest gradient is said to be 1 in 3½. Captain Deasy successfully ascended this precipitous hill, which is situated on the top of a long steep ascent, preventing the car from getting a run at the worst gradient. The surface was exceptionally rough, and there were five people on the 24-h.p. Martini. The car was driven backwards down this steep gradient, probably the steepest road in Great Britain. They then went on to the top of the mountain road to Otter Ferry, and, making a descent to Dunoon, put the car on the ferry to Greenock, and thence drove to Glasgow, from where they trained to Inverness to save time. From Inverness there was a drive over rough and narrow roads to Loch Carron, and from there up a very steep rise to Tornapress, where the ascent of Balloch Hill commences. Judging by the section of the road as depicted in route 330 of the Contour Road Book of Scotland, the ascent is a long and steep one, the surface bad, and turnings very abrupt and dangerous. The driver of the car which was hired at Inverness to take Mr. Gilbert Thomson from Glasgow, who came up specially to survey the gradients, and the representative of the Charles Urban Company, having refused to attempt the ascent, Captain Deasy was forced to accommodate these gentlemen, and their heavy instruments, on the Martini. With this abnormal load he started for the hill and successfully climbed it. The steepest gradient is 1 in 5·7, and that at one of the turnings, thereby rendering the ascent infinitely more trying than if it were on a straight part of the road. When endeavouring to descend to Applecross they suddenly ran into a heavy snowdrift, which completely blocked the way and rendered further progress impossible. This mountain road is generally considered the highest and the worst in Great Britain. In former years the mails to Applecross were sent by this way, but, owing to the difficulties of the route, they are now sent by sea. As the result of some careful inquiries made in the neighbourhood of Loch Carron, it would appear that no other motor-car has ascended this hill by its own power.

A NEW garage has been opened at Bervie, Kincardineshire, by Messrs. W. P. Davidson and Son.—Messrs. Murray have a capital repair shop at Crawford, a village on the main road from Glasgow to Carlisle.

MESSRS. J. THOMSON AND SON are opening a depot at 15, Renfield Street, Glasgow, where they will deal in motor accessories.

MESSRS. HARPER AND CO. have well-equipped motor repair works and garage in Canal Street, Wolverhampton. They also stock spare parts, etc.

THE Health Department of the Corporation of the City of London are open to receive tenders for the supply of a motor-car. They must be submitted not later than the 6th prox.

THE L. and N.W.R. Company has hotels in connection with its railway services at Euston, Birmingham, Bletchley, Crewe, Preston, Holyhead, Liverpool, Dublin, and Greenore.

The 12-15-h.p. Arrol-Johnston Car, with Cape Cart Hood, just delivered to Mr. John Osmond, of Blackheath.

CAPT. THEO. MASUI has just issued a very useful pamphlet, enclosed in a leather case, entitled "Hints on the Germain Chainless Car." The little work is one which should prove indispensable to all users of these vehicles, as hints are given on all parts likely to need attention or adjustment. The diagram and remarks as to lubrication are arranged in a very handy form. Particularly useful, too, should be the diagram of the ignition wiring, which takes in both the Eisemann high tension magneto and a reserve accumulator set.

THE vehicles and horses used in connection with the "Atlas" buses are to be sold by auction, the owner, Mr. C. W. French, having become converted to automobilism.

THE Vacuum Oil Company has prepared a special oil for use in connection with the engines on the Argyll cars. This is being put up in special tins for the London depot.

THE advent of the motor-buses of the Isle of Wight Express Motor Syndicate, Ltd., has opened up new possibilities of inexpensive travel to visitors to Ryde, which is one of the best centres from which to explore the island.

PASSING through Hampstead on Thursday last week, we came across one of the Herald 30-h.p. double-deck buses built for the Alliance Motor Bus Company, which was being subjected to a trial trip. Among the passengers were Mr. H. F. Clutterbuck and Mr. S. K. Albright, the chairman and managing-director respectively of the Alliance Company. The vehicle successfully mounted Haverstock Hill on the second speed.

THE standardisation of lamp brackets for side and tail lamps is being advocated by many motorists—both trade and amateur.

MESSRS. WITHERS AND CO., LTD., have converted part of their premises at 35, Edgware Road, into a large motor garage, and there they will carry on business as motor body makers, automobile engineers, and agents. A special feature will be made of the garage of the cars of private owners.

## HERE AND THERE.

MR. MAX GRADDON informs us that his new motor carriage building works in Mildmay Avenue, Mildmay Park, London, N., are approaching completion.

MR. MAX PEMBERTON has expressed himself well pleased with the business methods of the Motor House. With Sir Conan Doyle, Mr. Rudyard Kipling, and other well-known authors, he is an enthusiastic motorist.

THE annual motor races on the sands at Mablethorpe are fixed for Saturday, July 31st, and it is believed that the stream across, which made awkward little gullies last year, will be diverted, so that there will be an unbroken course.

MR. J. A. RYLEY, of Birmingham, has issued a new and comprehensive list of his motor specialities, which he will be pleased to send to any member of the trade who has not yet received a copy.

MR. W. F. CARPENTER has removed to 13, Cecil Court, Charing Cross Road, W.C. He is agent for C.A.V. accumulators, coils, lamps, etc.; he is also retaining his agency for Messrs. Bennett, Sons, and Shears, Ltd., radiators, tanks, bonnets, and silencers, which were exhibited at the Cordingley Show.

WE illustrate herewith a new collapsible and portable wind and dust shield, known as the "Moray," which has recently been put on the market by Messrs. Harrison and Brass, of Elgin, N.B. As will be seen, the arrangement is intended to protect the driver and his passenger on the front seat, and it is claimed to render the latter as comfortable as those at the rear. The shield, which is made of leather and lined with cloth, is supported by means of a wood frame so mounted as to give absolute protection to the arms, hands, and lower part of the body of the driver or other occupants of the car, and it does not interfere with the manipulation or operation of the steering wheel or levers, over which it projects, while, owing to the shield being bevelled inwards and rounded, it is claimed to diminish the wind resistance. The shield is fixed by four bolts to the front of dashboard and two iron pins to the elbows of the front seat. To

The "Moray" Collapsible Wind and Dust Shield in use.

gain access or egress to and from the car, it is only necessary to raise the arm of the shield from the elbows of the front seat, which can be done instantaneously, while when not in use it folds down over the top of the dash, taking up very little space. The shield, which only weighs 14 lb., can be fitted to all types of car by any coach builders or motor-car firm, Messrs. Harrison and Brass supplying the necessary fittings.

MR. EDWARD SMYTH has opened a new motor depot in Athboy, co. Meath.

WITH the object of familiarising the public with the "Car" vulcaniser, Messrs. Harvey Frost and Co. are offering a free tyre repair to motorists.

MESSRS. A. LEGE AND CO. are engaged on the construction of a 25-30-h.p. five-cylinder engine on the lines of the one described in a recent issue of the *M.C.J.*

MESSRS. BARKER have opened a garage with accommodation for forty cars at Lowesmoor Place, Worcester, where they are able to repair motor-cars, re-charge accumulators, etc.

WE illustrate herewith a new type of alternating to continuous current transformer, for use in connection with the charging of ignition of accumulators, which has been put on the market by the Crypto Electrical Company. This firm has for some time been making a machine for this purpose, but it has been composed of an alternating motor mounted on a cast iron base plate and coupled to a dynamo. As will be seen from the illustration, the base plate, coupling, and one pair of bearings and the rotor of the motor have been done away with. The motor is built on the same shaft as the armature of the dynamo. This renders the machine more efficient, owing to it being shorter in length and to the elimination of one pair of bearings. It also has the advantage of making the machine much more compact, its dimensions being only 15 in. by 13 in. by 11 in. The machine has been designed to enable those situated in districts supplied

by an alternating current to obtain continuous current for charging accumulators. The primary side can be wound for any voltage or periodicity on single two or three phase alternating current mains, and the secondary has an output of 100 watts, being usually wound for 15 volts 6 to 7 amperes. With this output it will charge nine motor-bicycle accumulators at a charging rate of 2 amperes, or three car batteries at a charging rate of 4 amperes and three cycle accumulators.

ACCORDING to a Covent Garden salesman, the West End tradesmen are suffering much loss of trade "owing to the long week end and the motor-car."

MESSRS. J. E. HUTTON, LTD., have established a well-equipped repair factory at 15, Britannia Street, Gray's Inn Road, King's Cross, N. While a specialty will be made of Mercedes, Panhard, and Berliet vehicles, repairs to all types of cars will be carried out.

THE 14-16-h.p. engine manufactured at the Argyll Company's new works at Alexandria is giving excellent practical results. The other day Mr. J. A. Bennett, of Manchester, called at the works to take delivery of a new car, which he drove all the way to Cottonopolis, climbing every hill from Helensburgh onward on the top gear.

A PLEASING incident took place at the Collier Tyre Company's depot a few evenings ago, when the staff presented Mr. W. G. Williams with a handsome tantalus as an expression of their appreciation. As we have already noted, Mr. Williams has now taken up the position of general manager to the Deasy Motor Car Manufacturing Company, Ltd.

MESSRS. S. HICKS AND SON have a well-equipped motor depot at Truro.

A BRANCH garage has been opened by Messrs. Letzer and Jordan in Clarence Street, Kingston.

A MOTOR repairing depot has been opened by Mr. W. Crumpin at 171, Church Street, Fulham Road, S.W.

A BULB-CARRIER for attaching to the steering column of the car has been introduced by Mr. H. Littlewood, of Huddersfield.

MESSRS. W. WEEKS AND SON, LTD., are opening well-equipped and spacious repair premises and garage on the main road, Maidstone, to be known as the Maidstone Motor Garage.

ATHERTON STREET, LIVERPOOL, now possesses a motor garage, the same having been opened by Messrs. John Wilson and Sons, of South Castle Street, Liverpool. Mr. Wilson, jun., will be in charge.

IN a case before the Brighton Bankruptcy Court the debtor alleged that her drapery business fell off when the motor-buses began to run past her shop, taking people away and spoiling the takings.

FROM the A.C.G.B.I. comes a handy summary of the legislation now in operation with regard to motor-cars, compiled for the benefit of those entering for the Club's driving and mechanical proficiency certificates.

A COMBINATION motor police patrol and ambulance is being constructed by the Reo Motor Car Works for the Police Department of Lansing, Mich., U.S.A. The vehicle will be propelled by a 16-h.p. motor, and will have a seating capacity for twelve persons. A stretcher will be carried under one of the seats.

MR. T. M. DREWETT, of Northfield End, Henley, has added to his business as a carriage builder a motor and motor accessories department, under the superintendence of an experienced engineer. The charging of accumulators will be undertaken on the premises, and all descriptions of tyres and motor parts stocked.

THE Continental Tyre Company have now over 250 stocks of tyres distributed over the country, and stockholders can be easily recognised by the blue and white enamel plate hanging outside. Bold signs have also been placed on some of the principal country roads indicating the name and address of the nearest stockholder.

A FIRM of publishers at Clifton have issued the following advertisement:—"Motor-buses within 120 yards of the door, but do not pass our premises, so that carriage customers can pull up without annoyance. Flaneurs in the pleasant Mall, who wish to study our windows, can do so in quietude and yet gain the motor and tram system within half-minute to any part of the City."

THE Rotax Motor and Cycle Company, of 43 and 45, Great Eastern Street, E.C., have issued a new catalogue of motor accessories. Special attention may be drawn to the Rotax magneto, which is of the high tension type, but is worked direct from the magneto to the plug without any coil. By the use of the Rotax combination coil it is possible to switch from an ordinary high tension to the magneto using the same set of sparking plugs and the same set of wires. The anti-vibration buffer, the Rotax coil with self-adjusting trembler, the Sphinx accumulator, and the Rotax non-skid are other specialties of merit.

MR. F. L. ANDERSON, of Furnival Street, London, E.C., has recently introduced a half compression and petrol injection tap for use on petrol motors. The feature of the device, which is known as the "Gnaviter," replaces the ordinary compression tap for which provision is usually made. When open it acts as a valve for releasing compression, but with the advantage that it does not weaken the quality of the incoming charge of gas, since on the inlet stroke a ball is drawn into the corresponding seating in the plug of the tap and forms a practically air-tight valve, the admission of air into the cylinder being prevented. For the injection of petrol the tap is turned so that the ball is removed from the seating and placed upon a grating formed at the end of the hole in the plug.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, W.C.]

### SMELL AND SMOKE FROM MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Whilst conducting some experiments on the relation of the viscosity of oil with the lubrication of internal-combustion engines I received indication, so it appears to me, of the cause of smell and smoke which issue from the exhaust. I ran a four-cylinder 20-h.p. engine (with the back wheels of the car jacked up), replacing the ordinary crank-chamber and cylinder oil entirely by "water white" American burning paraffin oil, and, although a large excess of paraffin was used, there was no visible vapour and only a slight smell of paraffin oil, showing, I think, that such proportion as did not undergo complete

### LOCOMOBILE CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Would any of your readers kindly give me their experiences with and opinions of the above cars? I am going in for a small car in a very hilly district and am uncertain what to have. In the first place I am not wealthy, and in the second do not, as a rule, want to carry passengers other than myself. Distance forty to fifty miles per day. I mention the above cars for this reason: While travelling the Cotswold district recently in a 7-h.p. petrol car belonging to a friend, we got stuck on a hill, and, although for no great length of time there, we were overtaken by a 4½-h.p. Locomobile, carrying two, and they gave us some valuable assistance which enabled us to restart in a few minutes. Before starting, noticing our friends were of the mechanic class, we said we were sorry not to be able to offer them anything, having at the moment but little silver on us, and suggested a call at the nearest "public" as some slight recognition. They mentioned one about two miles further on up a long steep hill with a mile or more fairly level run. "All right," we said; "as you were good enough to wait for us, we will wait for you." They saw us start, and, to our amazement and disgust, before we had run 100 yards their gong was going for us to pull

Motor Touring in the Dauphine District of France. A View of Grenoble and the Belladonna Range.

combustion was simply distilled, without decomposition, and came away with the exhaust. As soon as the paraffin was replaced by a pure mineral lubricating oil (also in excess), the vapour became visible and the smell unpleasant, being evidently caused by the decomposition as distinct from the distillation of the mineral oil.

When proportions of fatty oils (such as rape, coconut, lard, &c.), were used in admixture with the same mineral lubricating oil, one could not detect any increase in the density of the smoke, but the smell became far more pungent, as would naturally be expected from the decomposition of the glycerides composing the fatty oil. I therefore believe that the best oil to use to minimise the smell and smoke is one which will distil most completely at the temperature in the combustion space, without decomposition, and such oil will also be the one most free from carbonisation, because carbonisation of the oil is only caused by its decomposition as distinct from its distillation. I find that a small pipe brought from the exhaust through the dashboard gives the driver an indication of smoke due to over lubrication before the effect is noticed beyond the silencer, and I think perhaps if some such device were adopted by the omnibus companies the excessive smell and smoke might be avoided.—Yours truly,

A. DUCKHAM.

on one side. The rest was a surprise. Their car, which was of the shabby order, simply romped away from us up the hill and, with no noise or dust, soon left us a long way behind. On approaching the pub, they had already restarted, leaving us to pay for the drinks as arranged. What I am sorry for is, that there was thus no opportunity of having a chat with these men nor any correspondence since. I should like to know in regard to these cars: How long it takes to get steam up? How many miles per gallon petrol? What speed capabilities they offer and the distance they run with one filling of water? A friend tells me that there is such a lot of hand pumping for air pressure and water for boiler. Can this be remedied? Thanking you in anticipation.—Yours truly,  
E. MARTIN.

### SPRING WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letter of Mr. J. Bryant in the *M.C.J.* of May 19th is exceedingly pertinent. It has long been a wonder to me why cars were not made with springs which would allow of ample comfort without pneumatics. And, as he says, somewhat higher wheels would probably mitigate the dust nuisance, and afford additional mechanical power

without sacrificing safety. Will Mr. B. kindly state the maker of his car which is so well sprung? But when he goes on to recommend solid tyres, is not this a case of merely exchanging one trouble for another? Of course solids cannot be punctured like pneumatics; but are they not very liable to stretch and creep and finally come off? Such, at least, has been the experience of a medical acquaintance of mine, who bought last autumn a car fitted with solids, but two months ago discarded them for pneumatics for the reasons stated.—Yours truly,

F. C.

### A DARRACQ CAR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am very much troubled in starting my new 20-32-h.p. Darracq car. The accumulator and commutator both give four volts when tested and each plug is sparking, yet when running on high tension the engine misses fire though running very well on magneto, so the carburettor must be in order. The high tension wires from the coil to the plugs are in order, having been recently renewed. Can you suggest the cause of the difficulty in starting and of the misfiring when running on high tension? Would it be any advantage for easy starting to fix a trembler coil?—Yours truly,

LANCASHIRE.

[With reference to "Lancashire's" trouble we should rather think the difficulty is at the contact breaker; this might be carefully cleaned and adjusted, or the points of the sparking plugs should be tested to see if they are too far apart. A high-speed trembler would be a great advantage to facilitate easy starting, but with the type of contact breaker it would need to have a very high speed coil, unless the cam be lengthened to give a longer contact.]

The Motor Van which for some time has been travelling round England to demonstrate the agricultural resources of Canada recently broke down about four miles from Bromyard. Messrs. A. and E. Pettifer, motor agents in this town, after trying to tow the van, which weighs 6½ tons, by means of three motor-cars, had to give up and call in the aid of one of their road traction engines, with which they towed it to Hereford for the Fair, a distance of sixteen miles, in three hours. The incident is interesting as showing the resources of a motor firm in a small provincial town.

### THE COURTESY OF THE ROAD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice a writer has had a hit at what he terms the "Provincial motorist." No doubt, in the eye of the "London scorcher," he is a poor fool, as nine times out of ten he keeps and uses his car in place of horses and carriage, and having driven the latter for years has learnt the etiquette of the road, and how to behave thereon towards the other users of the road, even if they are retrograde enough to still prefer the horse. I notice there is still a considerable percentage of drivers (non-provincial). I generally see who appear to think the roads were made entirely for their benefit, and that they can scorch from one place to another, regardless of the hideous dust they make and the close shaves they give any unfortunate vehicle which does not get into the gutter to let them pass.—Yours truly,

L. F. ARCHDALE.

### FOUR SPEEDS ON THE REVERSE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—One of the most irritating drawbacks to the motor trade at the present time is the lack of competent motor-car repairers. Far too small a percentage of those concerns which advertise on their signboards that they are motor-car engineers have qualifications to the title. Thus a few days ago a medical man, resident not far from Nottingham, left

his Talbot car in one of these alleged repair shops for overhauling. In course of time the job was reported finished and the doctor went to drive his car home. Judge of his astonishment when he put in its first gear and let in the clutch, instead of, as he expected, moving out of the garage the car promptly went backwards. Naturally there was much astonishment, which was increased when it was discovered that putting in the reverse gear caused the car to go forward, and investigation disclosed that the engineer responsible for the repair had been most careful in meshing the bevel gears in the back axle, but had put these in right hand for left, with the natural result that the doctor's car had the peculiar combination of one low speed forward and four on the reverse. This is no fairy tale but an actual fact.—Yours truly,

R. W. S.

### THE TYRE TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It would be interesting to know how the cost of the tyres in the recent competition organised by the A.C.G.B.I. compares with actual touring experience. These were as follows:—

Tyre.	Weight of cars in tons.	Miles run.	Cost per ton mile in pence.	Cost per car mile in pence.
815 by 105 beaded edge	1.31	4004	1.9	2.48
34 in. ...	1.58	4092½	2.11	3.34
36 in. ...	2.03	4008	3.08	6.15

Evidently these trials have but demonstrated that we have not yet reached the penny a mile stage. When we do perfection in automobile work will be nearer than now.—Yours truly,

A PROSPECTIVE MOTORIST.

### MOTOR TRIP FOR CRIPPLED CHILDREN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We are venturing to call your attention to the claims of the Manchester and Salford Crippled Children's Help Society.

Last year we succeeded in interesting sixteen gentlemen owning motor-cars, who very kindly let them for the purpose of giving the children an afternoon's outing.

The experiment proved so very successful that it is intended to give them the same pleasure again this year. There are, however, several hundreds of these children in the city on the Society's register, and it is with the hope that a greater number may be included that we solicit your interest on their behalf.

Saturday afternoon, June 30th, is the date decided upon, the distance out to be about fifteen miles, to some suitable rural spot where tea can be obtained.

If any of your readers can see their way to assist us in this very worthy object, we should be glad if they would kindly communicate with any of the undersigned as early as possible, stating the seating capacity of the car, and also whether they will drive themselves or send their chauffeur.—Yours truly,

WM. HYDE, J.P.  
SAWLEY BROWN.  
W. COISWORTH.  
C. B. HOLMES.

### WORM GEAR TRANSMISSION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Could you or any of the readers of the *M.C.J.* explain what takes place on a car having a worm drive to back axle, when using the engine as a brake, as I fail to see how a cog-wheel is going to drive a worm?

One would naturally expect the whole thing to smash up, although it certainly does not do so; but why is it?—Yours truly,

W. L. ALMOND.

[The reason that a worm gear back axle does not "smash up," as our correspondent would expect, is that the worm and wheel are both cut at the same angle, viz., 45 degrees. The worm having a number of threads and cut a very coarse pitch, getting as near to the 45 degrees as possible, the wheel of course has to be cut at a corresponding angle, thereby allowing the wheel to drive the worm as well as *vice versa*. If a worm were cut with a single thread, there would certainly be a smash up, for, as soon as the worm stopped rotating, the wheel would lock.]

### REPAIR WORRIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your last issue I observe a letter from "E. S. 162," in which he asks if any of your readers can recommend a good firm or company in Scotland or the North of England where one could have any small repairs expeditiously effected at a reasonable cost.

Regarding tyre repairs, I have found one firm who undertake to return tyres properly repaired, and further, to guarantee them for three months, and you may with confidence forward the enclosed name and address to your correspondent.

Manufacturers at present are suffering from swelled head, and once they or their agents effect a sale they simply do not care any—

thing for the long-suffering owner. The charge they make when once they do condescend to execute a repair or renewal order is simply monstrous.—Yours truly,

UTILITY.

### FAILURE TO CLIMB HILLS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a Little Star 7-h.p. four-seated car, and I fail to get on top speed even on level road, and although I have been able to take four persons up a certain hill on third speed, I failed with two up last week. The gearing must be right because down hill the car runs sweetly on top speed, but stops on the level if I do not change to second and to first at the slightest gradient. The water circulation is perfect, never getting hot. The carburettor is the one supplied by the Star Company. Would this be the cause of the trouble, and would you recommend a Longuemare carburettor be substituted?

Do you know any 10-h.p. engine (good make) that could be fitted on a 7-h.p. Star car?—Yours truly,

WELSH SWANSEA.

[The trouble mentioned by "Welsh Swansea" may be due to many things, and in all probability it may have nothing to do with the engine. We would advise him to go carefully through the transmission to see if any parts are tight or any of the bearings are worn, as this would cause the car to drag, although it would run down hill apparently all right. If the transmission is found in order, the various parts of the engine should be inspected and the wiring and carburettors gone over. As the carburettor already fitted has given such good results, we should certainly not dispense with it, as there cannot be a great deal the matter in this direction. With reference to fitting a new engine, we do not know of a suitable one for this type of car, and if more power is desired we would recommend consultation with the Star Company.]

### DRIVING THROUGH CRAWLEY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I enclose you a cutting I have taken from a local paper of Saturday relative to the speeds of motor-cars passing through Crawley. As a result of the discussion by the local authorities the police had a trap working up through the Crawley High Street, on each side of the level crossing, on Sunday.

Personally, I think if motorists will only drive slower through the High Street (which has several very nasty corners abutting on to it) the friction that now exists will gradually wear off. At all times of the week, from Sunday morning till Saturday night, motorists will do well and possibly save themselves several pounds if they keep on the look out from the county boundary of Surrey and Sussex, situated about two miles on the London side to about half-mile out on the Brighton side of Crawley, which is now infested with police traps.

I have been given to understand that on last Sunday week they were out at the game between 6 and 8 a.m., when they caught one motor-cyclist.—Yours truly,

FAIR PLAY.

[The cutting relates to a local discussion which reveals considerable animus against motorists.]

### PROSPECTS IN SHANGHAI.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In last week's issue of the *M.C.J.* I notice a statement by an American lady in Shanghai to the effect that the scarcity of good chauffeurs is the chief drawback to motoring out there. If that is the case, I am quite sure there are plenty of Englishmen who would like to go out there. I myself would not mind it for a year or two.—Yours truly,

G. S.

### RE-MAGNETISING A WEAKENED MAGNETO.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be greatly obliged if you or any reader of the *M.C.J.* can kindly tell me if the permanent horseshoe magnets of an ordinary low tension magneto can be successfully re-magnetized, and if so, how.—Yours truly,

W. H. H.

[A reply to the query raised by our correspondent will be found elsewhere in the present issue under the heading of "Current Topics."]

### THE GEARLESS CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I note that Mr. S. F. Edge has had the courage of his convictions and allowed one of his 60-h.p. six-cylinder Napier cars to be tested by the A.C.G.B.I. for possibilities of running without the necessity of a gear-box. In the A.C.G.B.I. official report of the trial I notice that the engine was stopped no less than seven times, and that five of these were in traffic. I think it would be of advantage if it were stated whether it was possible to start the engine from the driver's seat,

or was it necessary for the engine to be turned by hand to get it to start, as, if the latter was the case, I think it would be a very serious objection.—Yours truly,

INTERESTED.

### WHY WAIT?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was pleased to see your note under this heading in a recent issue of the *M.C.J.* There are those who still await the coming of the perfect car before investing, and it may be said without hesitation that they are not at all apt to purchase this season any more than they have been in the past three or four years. It is not that the perfect automobile is no nearer to-day than it was then—this phase of the question does not call for comment, although there is a large part of the population that still regards the motor-car as a mystery which may or may not go, as the whim strikes it. During the last few years, the automobile has been perfected beyond the expectations of its most sanguine advocates, and it may safely be said that it has attained a point where reliability and endurance are merely matters of intelligent care and attention on the part of the owner.

In short, the car has practically reached the status of the locomotive. After more than a century of development under conditions that have afforded a powerful incentive to improvement, the railway engine is still considered a long way from perfection by its designers. The sceptical ones usually select the locomotive and the ocean-going steamship as examples of reliability and endurance for the motor-car to approach, without considering for a moment that the former undergoes expert inspection daily and goes to the repair shops without a moment's delay if attention be required, while in the case of the

The 12-14 h.p. 2-cylinder Whitlock-Aster Delivery Van. The carrying capacity is approximately 15 cwt., and the petrol consumption about 25 miles to the gallon. The rear wheels are shod with solid tyres and the front with pneumatic.

latter the engine is thoroughly gone over at the end of every trip. Worn parts are replaced and painstaking care devoted to adjustment, so that every time a steamer leaves port its machinery is in the best of condition.

A motor-car seldom gets a thorough overhauling more than once a year, and in the interim is, in many instances, accorded but perfunctory care. As long as the motor continues to run, little attention is devoted to seeing that its various functions are being performed in a manner that makes for a uniformly high degree of efficiency. Repairs and adjustments are, more often than not, delayed until further procrastination is impossible, and the time comes when the motor refuses to run any longer. The man who is looking forward to the advent of the perfect car is awaiting a mechanical millennium, and if his enthusiasm is worth anything he need have no hesitation in acquiring a modern car which, if given proper and timely attention, will very closely approach to the ideal.—Yours truly,

R. W. BELL.

S. AND M. STEAM CAR.—We have an inquiry for the address of the maker of S. and M. steam motor-car mentioned in the "Complete Motorist."

HUB CAP FOUND.—Dr. Perceval Adamson, Marbury House, Birchfield Road, Birmingham, found a hub cap belonging to a Lanchester car at Sutton Coldfield, Warwickshire, on Saturday last. The owner can have it by applying to Dr. Adamson.

DARRACQ CARS.—"R.C." writes that he would be glad if any owner of a 20-32-h.p. Darracq car would give his experience of the same.

MOTOR-CARS FOR JAVA.—Mr. J. Chr. Lapp, Winconderneming, "Paal Lime," Wanasari-Bandoeng, Java, is anxious to receive catalogues of motor-cars.

## CLUBS AND ASSOCIATIONS.

### NORTH-EAST LANCASHIRE.

ON Friday of last week the North-East Lancashire Automobile Club commenced a non-stop run from Whalley to Edinburgh—a distance of 191 7-8 miles, via Clitheroe, Settle, Kirkby Lonsdale, Kendal, Penrith, Carlisle, Teviothead, Hawick, Selkirk, and Galashiels. A stop of an hour and a half was allowed for luncheon at Carlisle, and the arrangements were carried out by an enthusiastic committee, with Mr. A. Birtwistle as hon. secretary. The twenty-eight entrants with the official observers were as follows:—

1. Dr. Fox (Accrington), 6-h.p. Belsize; observer, F. Rushton.
2. J. S. Cordingley (Haslingden), 10-12-h.p. Humber, F. Davis.
3. Dr. Stephenson (Blackburn), 10-12-h.p. Midland, H. Garstang.
4. Mrs. T. M. Crook, 15-h.p. Rolls-Royce, T. P. Campbell.
5. A. Birtwistle (Wilpshire), 16-20-h.p. Daimler, F. Walmsley.
6. H. V. Blake (Accrington), 15-20-h.p. Belsize, R. P. Gerland.
7. Kendal Chew (Helmshore), 16-20-h.p. Humber, J. Marchant.
8. J. S. Cordingley (Haslingden), 16-20-h.p. Humber, T. Saul.
9. C. E. Kenyon (Wilpshire), 16-20-h.p. Humber, Rd. S. Crossley, junr.
10. A. Thompson (Whalley), 20-h.p. Rolls-Royce, T. Robinson.
11. Burton Hacking (Accrington), 18-24-h.p. Belsize, A. Barnes.

Mr. J. D. Lonsdale, of Accrington, at the wheel of his new 28-36-h.p. Daimler Car.

12. Jos. Birtwistle, 22-h.p. Daimler, F. Hodgkinson.
13. R. Crossley (Accrington), 24-h.p. Belsize, G. D. Walmsley.
14. J. Bibby, 28-36-h.p. Daimler, F. Rowland.
15. G. Burton, 28-36-h.p. Daimler, C. E. Kenyon.
16. C. F. Bury (Accrington), 28-36-h.p. Daimler, J. Davies.
17. J. D. Lonsdale (Accrington), 28-36-h.p. Daimler, H. Redman.
18. W. R. Allan (Accrington), 30-40-h.p. Belsize, Milton Birtwistle.
19. J. Briggs-Bury (Accrington), 30-40-h.p. Daimler, Wm. Cunningham.
20. Ed. Berry, 30-40-h.p. Daimler, H. Barton.
21. A. S. Bury (Accrington), 30-40-h.p. Belsize, Frank Birtwistle.
22. W. D. Coddington (Southport), 30-40-h.p. Daimler, G. W. Hardman.
23. Havelock Lonsdale (Accrington), 30-40-h.p. Daimler, S. Jackson.
24. W. Smith, jun. (Accrington), 30-40-h.p. Belsize, S. Whitehead.
25. Robt. Mangnall, 40-h.p. Napier, J. Hacking.
26. J. E. Baxter, 40-50-h.p. Wolseley, E. Berry.
27. Arthur Birtwistle (Blackburn), 35-h.p. Daimler, Herbert Arthur.
28. F. Birtwistle (Blackburn), 60-h.p. Mercedes, E. Haydock.

### LINCOLNSHIRE.

THE second annual 100 miles non-stop run of the Lincolnshire Automobile Club was held on Saturday, and was marred by the heavy rain which fell. The starts were from the homes of the respective owners, but the finish was at the club headquarters, the Great Northern Hotel, Lincoln, between half-past four and five, cars arriving before or after being disqualified. Two of the eighteen entries decided to scratch, while five others did not run, or at least did not finish. Of the rest, only two failed to do the non-stop. Mr. Cyril Nelson, 8-h.p. De Dion, had to put in a new sparking plug; and Dr. Percy Sharp suffered from a fierce clutch on a hill, thus spoiling his chance also. The following, who made absolute non-stop runs, will receive the club medals,

and the special prize awarded by the committee for the most meritorious performance goes to Mr. C. W. Pennell:—Mr. J. R. Richardson, Lincoln, 14-h.p. Mass; Mr. W. B. Jevons, Market Rasen, 10-12-h.p. Humber; Mr. A. A. Padley, Market Rasen, 16-20-h.p. Humber; Mr. C. W. Pennell, Lincoln, 16-22-h.p. Martini; Mr. G. Garnett, Gainsborough, 8-h.p. M.M.C.; Mr. Mayo, Bourne, 15-h.p. De Dion; Captain H. E. Newsum, Lincoln, 30-40-h.p. Daimler; and Mr. H. Marshall, Gainsborough, 12-16-h.p. Clement.

### MOTOR CYCLE UNION OF IRELAND.

THE Dublin centre of the Irish Motor Cycle Union of Ireland held a hill climbing contest in Co. Wicklow on Saturday last. Twenty-three competitors took part in the event, in which pedalling was allowed and horse-power of machines unrestricted. The weather was fine and bright up to the finish, but a drenching downpour set in just as the return journey to town was commenced and continued long after the majority had reached home. The times were taken by Messrs. T. W. Murphy and Colman O'Connell, the former acting as starter. Appended are details:—

Name.	Weight of Rider. st. lbs.	Machine.	Weight. lbs.	Time. min. sec.
C. G. H. Lewis	9 4	2½-h.p. F.N.	145	3 33
E. Badmaster	10 0	4½-h.p. Minerva	190	3 34
W. Ladley	11 0	2½-h.p. Morehampton	—	3 36 4-5
W. Jacques	11 5	2½-h.p. Alcyon	158	3 38 2-5
J. Armstrong	10 12	3½-h.p. Swallow	203	3 59 2-5
J. G. Drury	10 4	3-h.p. Triumph	160	4 1 1-5
B. Dumphy	8 4	2½-h.p. Minerva	140	4 2 2-5
T. W. Murphy	9 7	3-h.p. Singer	168	4 10
R. E. Price	11 6	4-h.p. Warner	136	4 15 4-5
C. W. Smyth	10 10	3-h.p. Triumph	156	4 20 4-5
D. O. B. Gill	9 2	2½-h.p. Minerva	122	4 24
Dr. R. White	11 0	2½-h.p. Peugeot	110	4 34
H. Quinn	11 6	3-h.p. Triumph	150	4 35
W. Guilfoyle	—	2½-h.p. Minerva	—	4 37 2-5
R. Howison	13 3	2½-h.p. F.N.	165	4 45
J. Mooney	15 11	3-h.p. F.N.	201	4 51 2-5
H. Mooney	11 13	2½-h.p. F.N.	179	4 52
P. S. Sheardown	11 0	3-h.p. N.S.U.	175	4 56 4-5
S. Black	10 0	2½-h.p. Buchet	100	5 41 1-5
V. H. Meredith	13 3	2-h.p. Triumph	136	5 17 1-5

Also competed, A. J. Kettle (13 st.), 3½-h.p. Wellington; E. Cannon (—), 2½-h.p. Minerva (—); C. Kavanagh (9 st. 7 lbs.), 2½-h.p. Morehampton (110 lbs.). The 3-h.p. Singer entered in the name of Mr. T. W. Murphy was, by permission of the committee, driven by P. J. O'Donohoe.

### HERTFORDSHIRE.

THE Hertfordshire Club held its fifty miles consumption trial on Saturday, and the event was an unqualified success. The start was made well to time from the club's headquarters, the Red Lion Hotel, Hatfield, where competitors' cars were filled before being despatched on their journey to Biggleswade and back, via Hitchin. The judges, Messrs. D. Corse Glen and W. Whittall, are to be congratulated on the very satisfactory manner in which they carried out their onerous duties. Below we append the official results:—

#### CAR CLASS.

Place.	Car.	Driver.	Weight. Tons.	Total consumption. Gals.	Consumption per ton mile. Gals.
1.	22-h.p. Sunbeam	Mrs. Woodhouse	1.5	1.525	.0203
2.	40-h.p. Napier	Mr. Cecil Edge	2.1	2.268	.0216
3.	12-h.p. de Dion	Mr. W. H. Colliver	1.35	2.0	.0296
4.	9-h.p. M.M.C.	Mr. H. R. Hickman	0.95	1.456	.0306
5.	12-h.p. Argyll	Mr. T. Hooydonk	1.25	2.025	.0324
6.	14-h.p. Marples	Mr. S. Marples	1.225	2.150	.0350

#### Huber

The Marples-Huber went about four miles out of the way, through the driver mistaking the road.

#### MOTOR CYCLE CLASS.

1. 3½-h.p. Quadrant... Rev. A. J. McKinney ... 0.15 ... 0.531 ... 0.708

Mr. H. L. Gibbs on a 3½-h.p. Quadrant also started, but had to give up owing to the sparking advance lever breaking.

### NORTHAMPTONSHIRE.

THE members of the Northamptonshire Automobile Club met, by the kind invitation of Lord Lilford (president of the club) at Lilford Hall on the 16th inst., and, in spite of the somewhat unsettled state of the weather, there was a goodly muster of about forty. There were present:—Major Hibbert (chairman of committee), Messrs. C. W. Bartholomew, W. Parker Gray, H. R. Greening, Dr. Henshaw, Dr. A. A. Hope, A. F. Mulliner, A. N. Mobbs, Chas. W. Phipps, Alfred Webb, Chas. Wicksteed, S. Yarde, and the hon. sec., Mr. Sidney Harris. The members and their friends were very much interested in viewing the fine collection of birds, etc., for which Lilford Hall is noted. Afternoon tea, very kindly provided by Lord Lilford, terminated a most enjoyable visit.

### BLACKBURN MOTOR CYCLE.

THE Blackburn and District Motor Cycle Club held a hill-climbing competition near Withnell, as announced in last week's issue, the highest award being a challenge cup presented by Mr. Harold Eccles. Several medals were also offered. Twenty-two competitors started. The best times were made by D. Duckworth, 3½-h.p. Fleet Ariel; H. Garstang, 3-h.p. Triumph; R. Holmes (Preston), 2½-h.p. Ariel; G. Ramsbottom, 3½-h.p. Minerva. In the passenger class A. E. Beard was first with his 4½-h.p. two-cylinder Minerva and side car.

### SUNDERLAND MOTOR CYCLE.

THE above club was formally started at a meeting on the 16th inst., a capable body of officers being elected, with Major E. Vaux as president. Thirty-three members were enrolled, and considerable interest was shown. Affiliation with the North-Eastern Automobile Association and the Motor Union is being carried out. Mr. W. E. Russell Jackson, 9, Hillside, Sunderland, is the hon. secretary and treasurer.

### SOMERSET.

THE annual general meeting of the Somerset Automobile Club was held on the 12th, at the invitation of Mr. and Mrs. Alfred Armitage, at their charming residence at Haygrass, Taunton. There was a large attendance of members, and some magnificent cars were lined up in the field adjoining the house. Among those present were:—Mr. Orme, Frome; Dr. Curd, Bath; Col. Barrett, Moreton, North Curry; Mr. Metford, Clifton; Mr. H. Hippisley, Ston Easton; Mr. Vaughan Jenkins, Monkton Combe; Mr. Elwes, Somerton; Mr. Eccles, Honiton; Mr. Hills, Bridgwater; Mr. J. J. Barstowe, Weston-super-Mare; Mr. Boles, Yeovil; Mr. Aspinall, Weston-super-Mare; Mr. Bayldon, Frome; Dr. Benson, Bath; Major Little, Taunton; Mr. Wills, Bridg-

F. Hesse (treasurer), H. W. Cranham, H. Bright, A. O. Jones, J. Arrowsmith, Langenbach, V. O. Neill, F. Smith and J. Whitehead.

The route lay right across the Cheshire plain through Middlewich and Nantwich on to Whitchurch and the historic town of Shrewsbury, with its meandering Severn. Church Stretton is on a line of railway, but it is to the motor-car that some of the party owed their first acquaintance with this ancient town, now inhabited by some 2,000 people, who, desirous of emulating the example of their county town, with its avenues of limes in the famous Quarry Park, have laid out a walk lined with trees, which "in future," in the words of the guide book, "will form one of the finest sheltered walks in the country." The church dates from the twelfth century, and has a splendid peal of eight bells, but the curfew is no longer rung at eight o'clock as in days not long since past, to guide travellers lost on the hills.

### KENT.

THE third meet of the season took place at Sevenoaks on Saturday. About forty members and friends sat down to tea served in the new luncheon room overlooking the beautiful gardens of the Crown Hotel. Those present were the chairman, Dr. Firth, and Mrs. Firth, Dr. and Mrs. MacFarland, Mr. and Mrs. Gardner, Mr. and Mrs. Austin, Mr. and Mrs. Bailey, Mr. and Mrs. Batchelor, Mr. P. J. Neate, Mr. Edward Latter, Mr. and Mrs. A. Booth Hearn, Mr. and Mrs. Shrubsole, Mr. J. Stace, Mr. and Mrs. Siddeley, Mr. and Mrs. Wyllie, the hon. sec. and Mrs. Kenyon.

The date of the hill climb event has been altered from June 2nd to June 9th, 1906.

### BLACKHEATH.

THE Westerham meet on Saturday last, as usual, attracted a good attendance of members, amongst them being:—Messrs. L. and H.

The Auto-Cycle Club's Hill Climb at Fernhurst. Mr. S. A. Ives taking the awkward corner on his Lurquin-Coudert Machine.

(See page 292).

water; Mr. C. Leslie Fox, Rumwell; Mr. Batten, Yeovil; Dr. Ingall, Somerton; Mr. Morgan, Shepton Mallet; Mr. Austin, Glastonbury Abbey; Dr. Duport, Frome; Mr. Clark, Street; Mr. Gliddon, Weston-super-Mare; and Mr. A. C. Allen, Taunton.

Mr. J. J. Barstowe was elected to the chair.

The balance-sheet, which was presented by Mr. Armitage, showed that the club had a balance in hand of £30 9s. 1d., the receipts having amounted to £159 16s. 1d. The membership is 105.

The Chairman proposed the adoption of the report and balance-sheet, remarking that he was pleased to notice that they had not suffered in regard to police prosecutions. Mr. F. J. Clark seconded the adoption of the report and balance-sheet, and this was agreed to.

The following gentlemen were elected as officials of the club:—President, Sir Wroth Lethbridge; vice-presidents, Sir Cuthbert Slade, Mr. J. J. Barstowe, Mr. J. Hargreaves, and Mr. R. A. Sanders; committee, Mr. J. W. Aspinall, Mr. S. Austin, Colonel Barrett, Mr. H. P. Batten, Dr. Benson, Mr. H. L. T. Blake, Mr. C. H. Dawe, Mr. P. F. C. Elwes, Mr. H. Hippisley, Mr. Vaughan Jenkins, Mr. R. B. Graves Knifton, and Mr. C. Chestermaster; hon. secretary and treasurer, Mr. A. Armitage. The Chairman, in proposing the re-election of Mr. Armitage as hon. secretary and treasurer, referred to the excellent work that gentleman had done, and a hearty vote of thanks was accorded Mr. Armitage.

### MANCHESTER.

THE Manchester Automobile Club held an outing on Saturday last at Church Stretton, some eighty miles from Cottonopolis. The occasion was the fifth run of the season, and a good contingent spent the week-end in this picturesque valley of the Shropshire "highlands." Despite a few minor derelictions from duty of one or two of the cars, all arrived early in the evening at the Longmynd Hotel. Among the members present were Messrs. J. A. Morris (president), J. Hoyle Smith (secretary),

Beadle (Regal); J. H. Bowden (Humber); H. A. Cunis (Krupcar); R. Cunis (Renault); A. Edwards (Humber); Colin Gordon (Humber); A. Jackson (Georges-Richard); Professor Lambert (Argyll); Leslie C. Lambert (Tri-car); Ralph Lucas (Lucas); T. Marshall (De Dion); H. J. Reeves (Tri-car); T. Thorne (Argyll); and W. Whiteway (Regal).

Four members of the club kindly placed their cars at the disposal of Col. E. J. Howard, commanding the 2nd Volunteer Battalion of the Queen's Own (Royal West Kent Regiment) on Sunday last for the purpose of a regimental tour, when the pleasure of motoring was combined with that of serving the country.

### AERO.

MR. FRANK HEDGES BUTLER, accompanied by Mrs. Harold Gould, Lord Royston and Professor Huntingdon, King's College, made a balloon ascent from the Wandsworth Gas Works on Friday, the 18th inst.; and at the same time Mr. C. F. Pollock, the Hon. Mr. Harbord, Count Biron, of the Aero Club of France, and Mr. W. Hall, of the Aero Club of America, ascended in another balloon. Mr. Harold Gould and Countess Castellane followed the balloons in a motor-car driven by the Hon. C. S. Rolls. Mr. Butler's balloon descended at Sunbury, after passing over Richmond Park and Kempton racecourse. The other balloonists came down near Chobham, within three miles of Woking Station.

### SOUTH HERTS.

THE first week-end run held by the club was that to Clacton-on-Sea on Saturday. The Royal Hotel, Clacton, was the meeting-place, and sixteen members sat down to dinner after a most enjoyable evening by the sea. On Sunday morning it was decided to start for home about two o'clock, in the driving rain. The troubles experienced on the home

ward road are still a nightmare to the writer. The run was a series of stops, either to help a friend with some adjustment, pump up a slowly leaking tyre, or express in vivid words a magnificent experience of the latest side-slip. Waltham Cross was reached about 8 o'clock by a bedraggled, worn-out assortment of motorists, who wondered, as they changed their drenched garments, whether the pleasure of a warm bath and dry clothes again balanced up for the seventy miles in the northerly rain.

MR. T. SANDERSON has been elected hon. sec. of the Edinburgh Motor Club.

THE headquarters for the hill climb of the South Herts Automobile Club at Newgate Street, Herts, on the 9th prox., will be at the "Coach and Horses," at the top of the hill, which is five miles from Waltham Cross and eighteen from London.

OWING to the inclement weather on Saturday only two members of the Sheffield Automobile Club took part in the projected run to Barnley Moor.

MOTOR-CYCLISTS in the Ipswich district are forming a Suffolk Motor Cycling Club. Mr. Standley Nunn, of 4, Tavern Street, Ipswich, is taking the initial steps.

THE result of the hill climb and brake test competition of the Essex County Automobile Club, recently held at Laindon, has been officially announced as follows:—First, Mr. J. Gurney Fowler, 24-h.p. Panhard; second, Capt. J. R. B. Newman, 18-h.p. Mercedes.

### THE BROWN TROPHY.

ON Saturday last the Motor Cycling Club held the competition for the trophy, valued at seventy guineas, offered by Mr. Albert Brown for competition by British cars. Starting from Slough, the run was over a seventy-seven mile circular course, which had to be covered twice.

Preparing for the Brown Trophy Contest. Mr. Albert Brown, the donor, is seen in the right of the picture.

Originally there were ten entries, but those who started, with the weight of car, passengers, and equipment, were as follows:—

		Cwts.
J. H. Reeves ...	8-h.p. New Orleans ...	19-875
A. Candler ...	8-h.p. Rover ...	15-25
C. W. Brown ...	8-h.p. Rover ...	18-7
E. Perman ...	12-h.p. Belsize ...	18-625
J. P. Betts ...	6-h.p. Rover ...	11-93
Miss Wood ...	60-h.p. Napier ...	41-93
S. J. Sewell ...	16-20-h.p. Rover ...	25-12

Mr. F. J. Jenkins had weighed for the start, but a derangement of the torque rod led to his withdrawal. In the end Miss Wood, Messrs. Betts, Brown and Perman finished, their losses in marks being respectively 50, 10, 25 and 140. The consumption of petrol was as follows:—Miss Wood 7-62 gals., Messrs. Betts 3-87 gals., Brown 5-84 gals., and Perman 7-3 gals. In the end, after taking into account the weight, petrol consumption and marks lost for stoppages, etc., Miss Wood was declared the winner of the trophy, Mr. J. Platt Betts being second, and Mr. C. W. Brown was third.

### IN A SCOTTISH TRAP.

AT Stonehaven recently, before Sheriff Robertson, three Aberdeen motorists were charged with having driven their motor-cars beyond the legal limit near Stonehaven. The names of the defendants were Mr. Peter Bisset, Aberdeen, Mr. J. H. Paterson, and Mr. J. B. Keith. After the evidence had been given Mr. Watt and Mr.

Blacklaw, in addressing the Court, maintained that the evidence given by the constables was unreliable. They held that the constables should have produced the paper on which they had first noted the time, and that the cases had not been made out.

The Sheriff said he considered that the cases were very important and he would postpone judgment.

On Wednesday of last week he said he found the charge proven and imposed a penalty of £2 in each case. In doing this the Sheriff said he did not consider these cases as serious. If he had his own way he should probably take the view that conviction should not follow unless it was clear that the driving was to the danger of the public, but the Act of Parliament stood, and, of course, he must act in accordance with it. He also thought it was perhaps a pity that this trap should have been laid in an unfrequented and safe part of the road. It would have been more satisfactory to catch people going too fast where there might be real danger. This, however, was probably the affair of the police authorities. He might also refer to the fact that in none of these cases had the parties got warning on the spot that they had been timed. No doubt there was no provision in the Act for this being done, but it was only fair that the accused should have this warning, and it should not be beyond the wish of the police authorities to devise means to give it to them. As he accepted the evidence there as conclusive, it did not affect these cases, but it might easily affect one's position in another case.

### THE INTERNATIONAL TOURIST TROPHY RACE.

THE following is a list of entrants for this event, which will take place in the Isle of Man in September next:—

1. Mr. John S. Napier ...	Arrol-Johnston.
2. Mr. A. Rawlinson ...	Darracq.
3. Mr. A. Rawlinson ...	Darracq.
4. Hon. C. S. Rolls ...	Rolls-Royce.
5. Hon. C. S. Rolls ...	Rolls-Royce.
6. Mr. Warwick J. Wright ...	Minerva.
7. Mr. D. Citroen ...	Minerva.
8. Mr. T. B. Browne ...	James and Browne.
9. Mr. C. Harman Wigan ...	Vinot.
10. Mr. John S. Napier ...	Arrol-Johnston
11. Mr. Alec Govan ...	Argyll.
12. Mr. Alec Govan ...	Argyll.
13. Mr. Harry Smith ...	Rover.
14. Mr. Albert Brown ...	Brown.
15. Mr. A. Mosses ...	Clement.
16. Mr. Claude Watney ...	Pipe.
17. Mr. T. C. Pullinger ...	Humber.
18. Mr. Edward Powell ...	Humber.
19. Capt. W. E. D. Owen ...	Aries.
20. Capt. W. E. D. Owen ...	Aries.

33. Mr. E. Lisle ...	Star.

### MOTOR CYCLE HILL CLIMB.

ON Saturday the Auto-Cycle Club held an open hill climb contest in the grounds of Blackdown House, near Fernhurst, Sussex, by permission of Mr. F. S. Philipson-Stow, J.P. Situated within the shadow of Blackdown Hill, amid beautifully wooded preserves, the wide, steep drive of the park has been found eminently suitable for testing the climbing powers of cars and cycles. One mile in length, the average gradient is one in eleven. Over some 380 yards, however, the incline is slightly more acute, while there are about 250 yards of one in 4½, which include a sharp corner about half-way up.

Appended are the particulars of the various events:—

CLASS 1.—For machines with engines having a cylinder capacity not exceeding 76 by 76, or the equivalent volume swept out.

E. W. Goslett, 2½-h.p. N.S.U., and Basil Pemberton, 2½-h.p. Minerva. Neither succeeded in covering the course.

CLASS 2.—For machines with engines having a cylinder capacity exceeding 76 by 76, but not exceeding 80 by 80, or the equivalent volume swept out.

Triumph Cycle Company (J. Marshall), Triumph, 3-h.p., 2 min. 17-4-5 sec.

Also competed: H. L. Cooper, Triumph, 3-h.p., and S. E. Pemberton, Singer, 3-h.p.

CLASS 3.—For machines with engines having a cylinder capacity exceeding 80 by 80, but not exceeding 85 by 85, or the equivalent volume swept out.

R. M. Brice, Brown, 3½-h.p. Brown, 1 min. 41 4-5th sec. ... 1  
 W. W. Genn, Eland, 3½-h.p. Minerva, 1 min. 45 sec. ... 2  
 S. E. Raffety (E. Hunt), Swallow, 3½-h.p. Kelecom, 2 min. 0 1-5 sec. ... 3  
 Also competed: Werner Motors, Ltd. (H. E. Blackney), Werner, 4-h.p. Werner; W. Pratt, Durkopp, 3-h.p. Durkopp; Werner Motors, Ltd. (O. C. Godfrey), Werner, 4-h.p. Werner; A. W. Wall, Ltd. (H. P. Rose), Roc, 4-h.p. Kelecom; L. W. Bellenger, Quadrant, 3½-h.p. Quadrant; G. Aldington, Quadrant, 3½-h.p. Quadrant; S. Webb, Quadrant, 3½-h.p. Quadrant; Triumph Cycle Company (F. Hulbert), Triumph, 3-h.p. Triumph; Magneto Motor Manufacturing Company (S. S. Hickson), C.I.E., 4-h.p. C.I.E.

CLASS 4.—For machines with multi-cylinder engines.  
 D. G. Gilmour, J. A. P., 6-h.p. J.A.P., 1 min. 40 3-5 sec. ... 1  
 D. G. Gilmour (C. L. Flood), Peugeot, 8-h.p. Peugeot, 1 min. 42 sec. ... 2  
 South British Trading Company (W. H. Wells), Vindec Special, 5-h.p. Peugeot, 1 min. 48 1-5 sec. ... 3  
 Also competed: Werner Motors, Ltd. (H. E. Blackney), Werner, 4-h.p. Werner; G. H. Tripp, J.A.P., 6-h.p. J.A.P.; H. C. Ebbutt (R. J. Bell), J.A.P., 6-h.p. J.A.P.; A. B. White (E. J. Hancox), Swallow, 6-h.p. J.A.P.; Magneto Motor Manufacturing Company (E. Warner), C.I.E., 5-h.p. C.I.E.; A. G. Reynolds, Vindec Special, 5-h.p. Peugeot; Hugh W. Gray, Rex, 5-h.p. Rex.

CLASS 5.—For machines with any size engine.  
 R. M. Brice, Brown, 3½-h.p. Brown, 1 min. 42 sec. ... 1  
 South British Trading Co. (W. H. Wells), Vindec, 5-h.p. Vindec, 1 min. 47 3-5th sec. ... 2  
 L. C. Motor Agency (S. A. Ives), Lurquin-Coudert, 7-h.p. L.C., 1 min. 56 4-5 sec. ... 3  
 Also competed: W. Getting, N.S.U., 5½-h.p. N.S.U.; G. H. Tripp, J.A.P., 6-h.p. J.A.P.; Triumph Cycle Company (F. Hulbert), Triumph, 3-h.p. Triumph; George Barnes, Barnes, 8-h.p. Barnes; G. H. Tripp, Bat, 4-h.p. Stevens.

CLASS 6.—For quad-cars, fore-cars, side-carriages, or trailers, carrying two passengers. Engine to have a cylinder capacity not exceeding 85 by 85, or the equivalent volume swept out, and to be fitted with a variable gear.

Magneto Motor Manufacturing Company (S. S. Hickson), C.I.E., 4-h.p. C.I.E. This machine did not succeed in covering the course.

CLASS 7.—For quad-cars, fore-cars, or trailers, carrying two passengers. Singer and Company, Ltd. (A. J. Geldsworthy), Singer, 9-h.p. Singer, 3 min. 4 2-5 sec. ... 1  
 Lagonda Motor Company (Wilbur Gunn), Lagonda, 10-h.p. Lagonda, 3 min. 9 sec. ... 2  
 J. Buckingham, Lagonda, 10-h.p. Lagonda, 3 min. 17 1-5 sec. ... 3  
 Also competed: A. Clifford Earp, Singer, 9-h.p. Singer; Riley Cycle Company (J. Browning), Riley, 9-h.p. Riley; Singer and Co., Ltd. (T. Read), Singer, 9-h.p. Singer; Phoenix Motor Company (J. Van Hooydonk), Phoenix quad-car, 7-h.p. Fafnir; A. Wright Riley, 6-h.p. Riley; E. C. Baker, Lagonda, 10-h.p. Lagonda.

### A JOINT CLUB MEET.

ON Saturday last, for the third year in succession, at the invitation of Mr. Francis A. Bolton, J.P., one of the vice-presidents, the members of the Derby Club had a most enjoyable run to Moor Court-Oakamoor, Staffs. In order to add to the attractiveness of the meeting Mr. Bolton had on this occasion kindly extended his invitation to the members of the Nottingham and Leicester Clubs, and offered a handsome silver cup for the winner of an inter-club hill climb, which was contested by four representatives of each of the three clubs. Soon after two o'clock the cars began to arrive in great numbers and were formed up on the cross roads at the top of Star Hill, the site chosen for the competition, from whence an excellent view could be obtained of the finishing point, and shortly afterwards the trials commenced. The teams chosen were as follows:—

#### DERBY.

E. H. Joule	...	...	15-h.p. Darracq.
F. Smith	...	...	16-20-h.p. Rover.
G. F. Reading	...	...	10-h.p. Wolseley.
C. R. Hewitt	...	...	8-10-h.p. Humber.

#### NOTTINGHAM.

M. Ross-Browne	...	...	40-50-h.p. Richard-Brasier.
E. W. Wells	...	...	30-40-h.p. Daimler.
J. Gaskin	...	...	16-20-h.p. Argyll.
H. Belcher	...	...	16-20-h.p. Humber.

#### LEICESTER.

H. Byron	...	...	20-h.p. Rolls-Royce.
J. Harpur	...	...	16-20-h.p. Humber.
H. B. Boreham	...	...	10-12-h.p. Darracq.
Doran	...	...	22-h.p. Minerva.

The timing arrangements were on the lines instituted by the Derby Club, and resulted in some very close and exciting finishes, the heats in which Mr. Wells beat Mr. Harpur and H. Belcher beat F. Smith being particularly well contested. The actual results were as follows:—

#### FIRST ROUND.

E. W. Wells (scratch) beat J. Harpur (with 1 min. 31 sec. start) in 2 min.

E. H. Joule, with 39 sec. start, beat H. Boreham in 4 min. 38 sec.  
 H. Belcher (scratch) beat F. Smith with 9 sec. start in 3 min.  
 Doran, with 15 sec. start, beat Gaskin in 3 min. 8 sec.  
 G. F. Reading, with 2 min. 41 sec. start, beat W. Ross-Browne in 4 min. 37 sec.  
 C. R. Hewitt, with 3 min. 39 sec. start, beat H. Byron in 6 min. 6 sec.  
 F. Smith and J. Harpur, the two best losers, passed into the second round to avoid a bye.

#### SECOND ROUND.

G. F. Reading, with 2 min. 37 sec. start, beat E. W. Wells in 4 min. 36 sec.  
 F. Belcher (scratch), in 2 min. 40 sec., beat E. H. Joule, who took 1 min. 38 sec. start.  
 Doran (scratch), in 2 min. 58 sec., beat Hewitt, taking 2 min. 58 sec.  
 F. Smith (scratch), in 3 min. 7 sec., beat J. Harpur, taking 19 sec.

#### THIRD ROUND.

G. F. Reading, with 1 min. 56 sec. start, beat Belcher (scratch) in 4 min. 20 sec.  
 Doran (scratch), in 3 min. 24 sec., beat F. Smith, with 9 sec. start.

#### FINAL.

Doran (scratch), in 2 min. 54 sec., beat Reading, with 1 min. 22 sec. start.

At the conclusion of the trials the members and their friends, to the number of some 200, adjourned to Moor Court, the picturesque residence of Mr. F. A. Bolton, where a most sumptuous repast awaited them.

The above illustration shows a view of the Wolseley Motor Garage, York Street, Westminster, which, from its enormous area, nearly three-quarters of an acre, gives special facilities for the storage of a large number of cars, any one of which may be taken out when required without interference with others.

Mr. Bolton and his staff were unremitting in their attention to the comfort of the visitors. After tea had been served, Mr. Bolton, with a few well-chosen remarks, presented the cup to the winner, who suitably acknowledged the same, many of the members afterwards taking advantage of the opportunity of strolling round the spacious and beautifully laid out grounds surrounding Moor Court, and towards seven o'clock the cars began to disperse, all who attended on this occasion being unanimous in the expressions of their appreciation of Mr. Bolton's kindness. The weather, unfortunately, though fine on the whole, was far from genial, and towards the close of the competition became cold and dull, rain falling slightly.

The course, which is a singularly picturesque one, was admirably kept by a special staff of police, who were aided in their efforts by the officials of the various clubs. The Derby Club had kindly lent their field telephones for the occasion (which had been laid down earlier in the day by Mr. C. T. Leech, hon. treasurer, and Mr. C. J. Allin, hon. sec., assisted by Mr. Bolton's staff) and proved of the greatest service in expeditiously starting and timing the cars. Mr. A. Barlow (Notte) acted as starter, and the times were taken by Mr. C. J. Allin (hon. sec. Derby A.C.), while Mr. F. A. Bolton acted as judge.

### ROAD REPORTS.

GLOUCESTERSHIRE.—We understand it is the intention of the Gloucestershire County Council to apply the fees for traction engine and motor-car licences—amounting last year to £600—for the improvement of the surface of the roads within its area.

NORTHWICH.—The surveyor reported to the Northwich Urban Council last week that experiments with calcium chloride liquor had

been remarkably successful, and that it proved to be an admirable dust preventative. The cost was less than ordinary street watering.

**BRAINTREE.**—The Baintree Urban District Council has asked the Essex County Council to set up danger signals warning motorists at the crossing near the Fox and Hounds, in Coggeshall Road.

**CHESHIRE.**—At the last meeting of the Cheshire County Council, there was a discussion on the dust question. Mr. Barlow, of Marple, and Dr. Hodgson, of Crewe, criticised the inactivity of the Main Roads Committee in the matter. The latter said that no county suffered more than Cheshire, and he knew a nursery gardener whose business was ruined by dust.

**TAUNTON.**—Attention is being called to three dangerous places on the road between Taunton and Bridgwater. There are also several awkward corners on the Minehead road, a particularly noticeable one being on the Taunton side of Crowcombe.

**CUCKFIELD.**—The Cuckfield Rural Council experiments in tarred macadam roads will not be made until the weather becomes settled and the roads thoroughly dry, so that the trial may be made under the best conditions. The Cuckfield Urban Council decided, as a Council, not to experiment with dust preventives, but some of the Councillors have been providing tar at their own expense in order to find out how far a tarred surface on an ordinary road is a palliative of the dust nuisance from motor-cars.

**YORKS (EAST RIDING).**—The whole of the main roads in this district are repaired with whinstone, which is said to throw off less dust than almost any other stone used for a similar purpose.

### COMPETITION FOR THE "GAMAGE" CHALLENGE CUP.

THIS event, between the North London Automobile Club and the Southern Motor Club, took place on Saturday last on the Bath road, proving to be a speed judging contest, each team consisting of six cars. The competitors drew lots for the speed at which they had to travel over the course, ranging from fourteen to nineteen miles per hour.

The following was the route chosen:—Start from the Berkeley Arms Hotel (main Bath road, two miles beyond Hounslow), take first turning to left, then straight to Bedford Church, cross main Staines road and straight to Feltham—passing over railway bridge and past Industrial School—through Feltham High Street, over railway station bridge, taking left-hand turning at four cross roads, then to Hatton (crossing main Staines road again), arriving in same road leading to Berkeley Arms Hotel.

The North London team consisted of the following:—

Mr. Max Graddon	...	...	15-h.p. Panhard.
Mr. Chas. Smith	...	...	12-h.p. Darracq.
Mr. W. Holmes	...	...	12-h.p. Darracq.
Mr. F. Horton	...	...	6½-h.p. Darracq.
Mr. C. Cannon	...	...	6½-h.p. De Dion.
Mr. E. Swingle	...	...	4½-h.p. De Dion.

The contest resulted in a win for the Southern Motor Club, the aggregate in their favour being 1,037 yards.

The following were the officials:—Mr. Durley (timekeeper); observers, Messrs. Brown, Barber, Hampton, Jenrick, Vincent, and Willden.

Amongst the North London members present were Mr. and Mrs. Cutler, Mr. Rodda, Mr. Pattison, Mrs. and Miss Graddon, and Mr. B. Smith, Mr. Bennett and Mr. H. Johnson.

The Southern Club were responsible for all arrangements, which were excellently carried out, a *manubal* being stationed at each turning to indicate the course, so that mistakes were impossible.

### NEW COMPANIES REGISTERED.

**GENERAL MOTOR-CAB COMPANY, LTD.**—£260,000. To adopt an agreement with the United Investment Corporation, Ltd., and to carry on the business of motor-cab, omnibus, car, carriage, van and vehicle proprietors, etc.

**MERCEDES DAIMLER AND DE DION MOTOR COMPANY OF GREAT BRITAIN, LTD.**—Capital, £1,000. To carry on the business of motor-car, omnibus, van and cab proprietors, carriers of passengers and goods, etc. Registered office, 1, Broad Street Place, E.C.

**BURNLEY MOTOR PLEASURE COMPANY, LTD.**—Capital, £2,000. To carry on at Burnley or elsewhere the business of motor-car and motor-boat proprietors, 23, St. James Row, Burnley.

**INDUSTRIAL MOTORS, LTD.**—Capital, £2,000.

### THE ENDORSEMENT OF LICENCES.

**JOHN CRAMP**, chauffeur, of Carlton Vale, London, did not appear to answer an adjourned summons at the Steyning Petty Sessions on Monday, for not producing his licence for the purpose of endorsement. Superintendent Hooker stated that on the 30th April defendant was fined for furiously driving a car. His licence was ordered to be endorsed on that occasion. The fine had since been sent, but the licence had not been produced for the purpose of endorsement. The magistrates ordered a warrant to be issued, the same to be suspended for seven days to enable the defendant to appear.

### PUBLIC MOTOR SERVICES.

THE G.E.R. have commenced a service of motor-omnibuses between Chelmsford and Writtle, Chelmsford and Great Waltham, and Chelmsford and Danbury.

THE motor-omnibus intended for service between Hurst and Hassocks station has arrived at Hassocks from London. Since its arrival it has made trips to Henfield, Brighton, Lewes, Bolney, Cowfold, and other neighbouring places.

THE ALDERSHOT AND FARNBOROUGH MOTOR OMNIBUS COMPANY, LTD., has been formed to carry on a motor service between the stations of the London and South-Western Railway at Farnborough and Aldershot, and between the towns and districts of Fleet, Ewshot, Guildford, Ash, Farnham, Frimley and Camberley, and any camps or other places where troops forming part of the First Army Corps may be stationed.

A MOTOR char-a-banc has been put in service by Messrs. J. I. Thornycroft and Co., Ltd., between Farnham and Haslemere, running in connection with the L. and S.W. Railway service.

### POLICE TRAPS.

THERE is a measured quarter of a mile in the Scotland Road, Carnforth.

TRAPS are being worked frequently on the London and Brighton Road, at Norbury.

IN the Plymouth Road, at Harberton, there is a measured half mile of road where the police are extremely watchful of motorists.

SUPERINTENDENT Marks is now timing motor-cars on Saturdays and Sundays in the Queen's Road, Hershaw.

CHANDLER'S FORD, near Winchester, is the scene of a police trap the length of which is 220 yards.

A POLICE trap, worked by an electrical apparatus is in active operation on the London road at Maresfield (near Uckfield, on the London-Eastbourne road). The police are hidden behind the hedge and the trap extends over a measured furlong, slightly down hill, and seemed to work very effectively last Sunday. News of this device is forwarded to us by a victim.

THE police have a measured half-mile near Bourtreebush, on the Stonehaven road.

THERE is a trap between Reigate and Crawley.

### MOTOR-CAR ACCIDENTS.

CROSSING Upper Brook Street, Mayfair, a girl named Emily Deane became confused at the "toot-toot" of an approaching motor-car. She hesitated, and then, stepping back, was knocked over by the car, sustaining injuries which proved fatal three hours later. At the inquest witnesses described the speed of the car as not more than four miles an hour. The owner, Mr. J. A. Dewar, M.P., who was riding with his wife at the time, said they had previously been stopped by the traffic. Deceased did not seem to realise her danger until too late. The jury returned a verdict of "Accidental death."

### DISMISSED, BUT TO BE "CARRIED FURTHER."

AT Chertsey, Lord Crichton Stuart, an officer stationed at Aldershot, has been summoned for exceeding the limit on his motor-car at Egham on the 7th inst. His Lordship told the police that he could not remember who was driving on the night in question, but he accepted the responsibility. For the defence it was contended that as the defendant was not told on the date of the information that he would be summoned the summons must fail. Further, no notice of the intention to summon him had been sent him. The summons was dismissed, but the magistrate expressed the opinion that the case should be carried further. The police said this would be done.

### A TAIL LAMP EPISODE.

THE state of Union Road, Oswaldtwistle, and Market Street, Church, came in for condemnation at Church (Lancs.) Police Court on Thursday last week, during the hearing of a summons against Absalom Westwell, for not keeping the rear lamp of a motor-car lit for the illumination of the identification number plate. P.C. Tipping stated in evidence that he saw the motor-car driven by defendant proceed along Market Street, Church. The three lamps at the front of the car were lighted, but the rear light for identification purposes was out. Replying to defendant, witness stated that he saw defendant drive up the road half an hour previously and get out and light the rear lamp. The lamp was still burning when he arrived home, where he found the lamp glasses so blackened with smoke that he could hardly see through them.

P.S. Graham agreed that the road was very rough and uneven, and after Supt. McKean had said the road in that particular place was liable to shake good lamps out, the magistrates decided that, as there did not seem to have been any negligence, the case would be dismissed. All the same, lamps ought to be provided that would keep in whatever the state of the roads.

# THE Motor-Car Journal.

VOL. VIII.]

LONDON, SATURDAY, JUNE 2, 1906.

[No. 378.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## THE 1907 EXHIBITION.

In view of the great increase in the output of British and Continental firms, as compared with previous years, as well as the number of new firms entering the industry, every effort has now to be made by those in the trade to bring their productions before the public at the proper season.

Hence the importance of Cordingley's Motor Car Show at the Agricultural Hall, London, which practically opens the buying season for the year. Spaces for the 1907 display are now being booked, and the new features that will be presented point to an even more successful Exhibition than the record event of 1906.

It should be remembered that those who sign Bonds seriously handicap themselves against those who prefer to retain their Commercial Freedom.

## COMMENTS.

**B**IRMINGHAM deserved the distinction of being the first provincial centre to welcome the Motor Union this year, and all must be congratulated on the success which attended the gymkhana and the dinner—two of the three main factors in the event. This year the discussions at the meeting presented no points of special interest likely to arouse keen feeling or evoke lively debate. The point upon which Mr. Rees Jeffreys has been asked to circularise educational authorities and chief constables is one of value to motorists on

tour, who have long experienced the dangers of stone throwing by children, a habit which seems to thrive in many districts. Often have we urged that this should be done by the Club, as the only effective way of checking the nuisance, and we trust that not only will the educational committees be communicated with, but that the resolution will be placed before the National Union of Elementary Teachers and other organisations of teachers, as the most effective means of getting to close quarters on the subject.

### The British Success in Italy.

As is recorded elsewhere in the present issue, the victory in the recent severe touring contest in Italy lies with the Fiat Company, for not only did Lancia carry off the gold cup and the first prize of £1,000 on a Fiat 24-40-h.p. car, but every one of the three vehicles entered finished the eleven daily runs with an evenness of record that is really marvellous. The performance of the two Napiers, which, together with a Daimler, represented the British motor industry in the event, is, however, little less noteworthy, and, in view of the way they were handicapped, their drivers, Macdonald and Glentworth, are deserving of the highest praise. Owing to the unfortunate accident to the Daimler car, it fell to Macdonald's lot to lead the way on all but the first day, the difficulty of which, having regard to his being unacquainted with the country and practically having no knowledge of the language, may well be imagined. Both he and

Glentworth, as indeed all the foreign competitors, had also to rely on their own resources as regards repairs and adjustments, while the Italians were able to call in the assistance of expert workmen from the factories stationed at intervals on the line of route. Although the result to the drivers of the Napier cars in the way of prizes is disappointing, no discrepancy in the timing can rob them of the honour of having achieved for Great Britain the highest position—nation for nation—in the contest, for of the three British cars entered two went through the entire trial, (equal to 66½ per cent.), as against only ten out of the thirty-two Italian vehicles (31½ per cent.). Germany's proportion of machines finishing to those entered was two to five (40 per cent.), Switzerland's one to three (33½ per cent.), and France's only one to five (20 per cent.), a somewhat disappointing result for the premier motor manufacturing country.

### Motor-Cars and Horse Troughs.

THE contamination of water in the horse drinking trough at Ebury Bridge has been receiving the serious consideration of the Works Committee of the Westminster City Council. It has been the practice of some motor-omnibus drivers to draw water from the trough by means of a pipe, which, as a rule, deposits oil in the trough, and so makes the water unfit for drinking purposes. The Town Clerk has been instructed to have affixed notices "warning persons that the water is the property of the council, and any persons found taking it for any purpose other than that for which it is provided, or in any way rendering the water unfit for animals to drink, are liable to be prosecuted."

### Fifty Feet from the Centre of the Roadway.

In view of the many applications for local improvements always before the House of Commons, we would draw attention to the advisability of those M.P.'s who pay regard to the requirements of the automobile industry to secure, where possible, adequate provision for the future needs of traffic. It would be a good notion to try and secure that no new building should be erected within fifty feet of the centre of trunk roads, so that the motor traffic of the future may have good wide thoroughfares whereon to disport itself. The popularisation of such an idea might be carried out through the local clubs if they could unite on a plan of campaign.

### The Width of Roads.

PRIVATE philanthropy is deserving of encouragement when it is concerned with the provision of light and air for the people; but such delights for the individuals residing in any particular part of the country must not be obtained at the expense of the general community. The tendency should be to increase the width of the roadways—a point quite as important as setting aside an area around the houses abutting thereon. And yet the promoters of the Hampstead Garden Suburb—whose zeal for the public interest all will recognise—have made an arrangement with the Hendon District Council by which they need not be under the obligation of making certain of the roads in the suburb more than 40 ft. wide. This

agreement is now being sought to be ratified in a Bill that has just come before a Select Committee of the House of Commons. There is no precedent for taking roads out of the bye-laws of the local authority, and the Committee, while agreeing that the company had a laudable public object in view, have rightly adjourned the matter before consenting to surrender such an important principle. Now that there seems a general consensus of opinion in favour of more uniformity in road maintenance and control, the present does not seem an opportune time to allow even the most unselfish organisations to contract out of the general tendency of things.

#### The Strike of the "Vanguards."

Not for the first time, has there been trouble among the motor busmen of the Metropolis. The dispute which has occurred this week is, however, the most important bother that has taken place in the new service, and the progress of the strife is being anxiously watched both by masters and men. These are not the columns in which to join issue with either party. Its effects have, however, been clear from the windows of the *M.C.J.*, where the proportion of motor-buses on the road is perhaps greater than on any other route in London. From

Dr. Page Robertson, of Gourock, N.B., on his Whitlock-Aster 18-22-h.p. car. The vehicle has seating accommodation for five persons, and, as will be seen, is fitted with canopy front glass and side curtains.

the absence of the Vanguards it has been evident that the men have become united under the lead of the London 'Bus, Tram, and Motor Workers' Union, which will naturally strain every effort to secure a result likely to hasten all the motor-bus drivers into membership. There seems much discontent with regard to lost journeys, and consequent low earnings, often attributable to mechanical causes over which the drivers have little and the conductors no control. The men demand a regular daily wage and a working day of reasonable length. On Wednesday the men resumed work, some different arrangements being agreed to by the company, and other points of difference being left for future settlement.

#### Motor Boating.

ALREADY there are signs that motor boating bids fair to have a good run of popularity. Several motor-boats are now plying on the Scottish lochs, and there should be profitable waters for development north of the Tweed. According to report received, private enthusiasm is even more pronounced in the south, and nearly 500 motor-boats have been

registered by the Thames Conservancy, while the activity of motor-boat builders is really pronounced. Meanwhile the Enchantress is proving popular with members of the Motor Yacht Club, and several cabins were occupied last week end. Half a dozen boats, ranging in size from Mr. Brickwood's 36-ton steam yacht Chrysophrase down to Mr. Winans' 13 ft. motor dingy, took part in a short cruise up the Hamble River to Bursledon. At present the number of motor-boats afloat in the Solent is somewhat limited, but every week sees additions to the fleet, and it is expected that future cruises will be well attended. Several applications for moorings have been received for the season. The long line of boom defence vessels moored fore and aft forms an excellent shelter for boats lying between the ships and the shore.

#### The Coaching Club Meet.

SAD and dampened was the outing of the Coaching Club in Hyde Park on Saturday, the occasion being the first meet of the season. The attendance of members was scanty, and some of those who were present were late in arriving. Rain, and not the victory of the motor-car, was the cause of the dispiriting character of the assembly. Lord Desborough, the new president, led the procession, and only three or four coaches went on to Hurlingham. As for the general public, there have seldom been so few seen in that pleasant drive by the side of the Serpentine; in fact, it was practically deserted but for half a dozen electromobiles at Hyde Park Corner.

#### The Road Club.

THE glories of the old coaching days are past; whether some of them will be revived by the Road Club now setting to work is a matter upon which we await the verdict of time. We understand that already seventy-six hosteleries have been selected as the roadside quarters of this club in different parts of the country, and that the "Iolanthe" room in the Savoy Hotel, London, is to be placed at the disposal of the Committee. Other recognised hotels of the organisation will be at the North British Station Hotel, Edinburgh; "Ye Olde Bell," on Barnby Moor; the George, Grantham; the Bellevue, Dunbar; the Royal County, Durham; the Red Lion, Hatfield; the Station, York; and Skindle's Hotel, Maidenhead. Arrangements are being made for the appointment of hotels on all the main trunk roads, and evidently the comfort of the motorist is being regarded as a matter of prime concern to the members of the Road Club.

#### The Airship at Sea.

NAVAL as well as military experts are watching with interest the developments that are progressing with regard to aerial navigation, and Rear-Admiral Sir James Campbell believes that the airship has become one of the possible weapons of future naval warfare. Free airships, when perfected and capable of accurate navigation, would be most useful in "spotting," but by that time, if the "conquest of the air" advanced at the present rate, the watership would have assumed the role of the sparrow and the airship that of the hawk. He hopes that it will be possible before long to do away with funnels. At present the two most probable solutions of the problem of dispensing with the funnels seemed to lie between a system of utilising the wasted energies of coal to obtain power, and a system of propulsion without fires, substituting in the latter case explosive force, as already used in motor-cars and boats in internal combustion engines. The Admiral predicted that such motors—oil, gas, petrol, or chemical—will grow in size and number, and will eventually become the motive power for the purposes of commerce and war. In fact, he declares that in the long run air fleets would be a serious menace to water fleets, and might eventually replace them.

### The Length of Traps.

MAGISTRATES are beginning to realise what motorists have long declared, that a measured distance of 220 yards or thereabouts is not a fair distance in which to decide the speed of a car. In such a short stretch the error of a few feet in measurement or a second in timing may mean a great difference in the alleged speed compared with that actually performed, while the justice of the business is further minimised when the trap is marked out on a road that has a descent. Several police authorities have abandoned this idea of the short run in favour of the more equitable plan of judging the pace over a distance of two or three miles. Unfortunately, however, the exponents of the "furlong trap" seem to reign in districts where motorists abound.

### The Motor-Car Commission.

M.P.'s are being frequently reminded that a Royal Commission on Motor Cars is now cogitating with regard to the future legislation affecting automobiles. Fortunately, the patience of motorists is untiring, and persecution has given them experience in suffering and trial, so that they do not arise in numbers at the apparently lethargic state into which the Commission seems to have fallen. Now and again a member in the House asks whether the report is ready, and Mr. Burns is able to reply in the negative. This circumstance happened again last week, when a little more official optimism seemed to run through the right hon. gentleman's answer, for he understood that the preparation of the report is being proceeded with "as rapidly as possible"—a rate of speed much below the legal limit and also the celerity of the present Parliament. In fact, it

The Italian Coppa d'Oro Touring Contest. Cagno on his Itala Car, which secured third place. (See page 301).

### The Cheshire Method.

IN view of the remarks of the magistrate at the South-West London Police Court, some interest attaches to the new plan now adopted by the Cheshire police in timing the speed of motor-cars. The method hitherto has been to station constables an eighth or a quarter of a mile apart, and within sight of one another. Now the police take up positions at milestones, and may be two, four, and even ten miles apart from each other. They are supplied with watches, which are compared, and printed cards. On the card they set down the number of a car which passes them, the exact time, and the direction in which it is travelling. The second man at a milestone beyond also jots down the number of the car and the time it passes him. Afterwards a sergeant, mounted on a bicycle, goes from one constable to another and compares the cards. If it is found by the times that the speed limit has been exceeded, it will be ascertained to whom the car belongs and a summons issued.

would appear that something will be gained by the adoption of Mr. H. J. Tennant's suggestion with regard to the inclusion of the present measure in the Expiring Laws Continuance Bill. In that case the new measure would stand a better chance of adequate discussion than if introduced in the present crush of legislative efforts.

### The Motor Mileage Map.

ONE of the appurtenances of every garage and hotel that caters for the motorist should be a reliable and accessible map of the country likely to be explored by their visitors. Those hitherto published have scarcely been suitable for this purpose, but at length the want has been filled by Mr. E. Touboul, who has issued a motor mileage map for the wall as well as for the wallet. Strongly mounted, it has the essential merit of durability; intelligently prepared, it supplies the motorist with the distances between villages and towns,

these being plainly set forth for easy reference. Altogether this map, which is published at 161A, Piccadilly, London, is one of the best we have seen, and deserves success. Main and subsidiary roads are shown, places where good hotels are to be found are indicated, a table of mileage distances from London is given, and a convenient index adds to the comprehensive character of the map.

#### A Sensible Bench.

THE example set by the chairman (Mr. J. E. Le Feuvre) of the Southampton Borough Police Court should find imitation wherever magistrates are desirous of dealing out justice without partiality and prejudice. After hearing a case in which the policeman charged a motorist with driving at a dangerous speed when there was no evidence as to traffic being in that particular part of the road, the chairman called the inspector and requested him "to instruct constables to give the Bench information in future cases as to whether there were any tramcars, carts, or any number of pedestrians about at the time of such alleged offences. For all the magistrates knew, in this particular case there was not a single person or vehicle in the road at the time." Without venturing into the legal intricacies which may be involved in the interpretation of such an instruction, we would emphasize its value from a common-sense point of view. It would seem that the term "dangerous driving" should involve possibility of hurt to someone on the roadway; but the opinion of the police is generally regarded as sufficient.

#### The Diversion of Trade.

QUITE a wave of consternation has come over the pleasant Sussex town of Hailsham in consequence of the erection of direction plates at the ends of Summerheath Road and North Street, showing that the way to Eastbourne lies through those residential thoroughfares. Shopkeepers are complaining that traffic is thus diverted from the High Street, where passing motorists might be tempted to linger; the residents of the roads through which the cars are directed are indignant at the dust that is raised by the motorists; and the ratepayers generally object to the passage of traffic over roads which they maintain in preference to a thoroughfare that is a county main road, and, therefore, of no direct financial drain to themselves. Probably the result of this triple opposition will be the withdrawal of the directions, and motorists will find their route the best way they can.

#### Interest in Shanghai.

RECENTLY our correspondence columns contained a letter from a driver willing to go to Shanghai to look after a motor-car if he could find employment there. From all accounts the automobile movement is progressing there, but we should not advise anyone to journey thither without knowing more than is, at present, apparent with regard to motor matters. Several letters have lately reached us from English chauffeurs which indicate a great curiosity with regard to automobile prospects in Shanghai. We shall be glad to hear from some of our readers in that part of the world as to the actual state of affairs and the position of motoring there, both from the industrial and social aspects.

#### From Ross to Chepstow.

MOTORISTS in the Bristol or South Wales district are familiar with the Valley of the Wye and that charming run of twenty-six miles from Ross to Chepstow. This is the road distance; by river the journey is another ten miles; in a straight line the journey would be within the hour's legal limit as known to motorists. Ross is the acknowledged centre for the trip, whether by car or cycle. The road is downhill to Kerne Bridge, near which is Goodrich Castle, from whence there is the choice of way to Monmouth through Whitchurch, or direct to Symond's Yat, by way of Huntsam Bridge. The former

road, though easier, has less to commend it in the way of scenery. The Yat is one of the most romantic spots in the county, and will detain those who love the beauties of natural scenery more than Monmouth, which is the next town of importance. Thence the Wye becomes a winding stream with limestone gorges, making the district a place of entrancement indeed. Tintern, with the grey walls and roofless abbey, lies in the midst of delightful meadows, and justifies its world-wide reputation. Between there and Chepstow is very little of interest, and care should be taken by motorists after leaving St. Arvan's.

#### Cars for an International Conference.

FEW movements are so international in character as automobilism, which has established itself on cosmopolitan lines, both with regard to cars and their drivers. The frequent interchange of visits between the motorists of the various countries, and the long tours that have been organised through different lands, have all done something to soften the asperities of social and national differences, and to establish a motor freemasonry throughout the world. Now it is understood that further demonstration of the pacific value of the motor-car will be afforded in July, when the great international conference of legislators favourable to the idea of peace and arbitration will take place in the historic Westminster Hall. Already the use of 500 automobiles has been promised to the British organising committee, and a procession longer than that which greeted Princess Ena in Madrid will testify to the universal favour of the car.

#### Progress in New Zealand.

THE Government of New Zealand is to be asked to bridge some of the creeks on certain routes with the view of enabling private enterprise to launch a motor-car service next summer between Timaru and the Hermitage—a trip that Messrs. Wigley and Chaffey regard as offering opportunities of profit. This is but one evidence of the growing popularity of the motor-car, towards which, trials and competitions held by the local automobile associations have made substantial contributions. The latest of this series was a four days' run from Auckland to the Hot Lakes District and back again, the way being over some hilly and sandy districts. In this a Cadillac 12-h.p. and a 15-h.p. Darracq tied for the Cup that was offered the victor.

THE Birmingham Small Arms Co., Ltd., are about to undertake the manufacture of motors and component parts at Sparkbrook.

A SENIOR in the mechanical engineering department of the University of Pennsylvania is carrying out a series of tests to investigate the efficiencies of the entire mechanism of a motor-car, from the engine shaft to the wheels. The conditions under which the tests are being carried out are, as far as possible, those of road operation. The trials are being made at several different loads for each gear ratio.

AFTER the racing at Frome's Hill, the competitors returned to Hereford, where, at the Green Dragon Hotel, opposite the headquarters at the Mitre, a pleasant evening was spent, Mr. Charles Friswell proposing the toast of "The Herefordshire Club," on behalf of which Mr. J. T. Hereford responded, mentioning that although located in a sparsely populated district, it had 100 members, and had attained a distinction among clubs with which all were in cordial agreement.

IN the A.C.G.B.I. speedometer trials the gold medal has been awarded to the Jones speedometer, the silver medal to the Elliott device, and a special gold medal for excellence of design, workmanship and accuracy to the Kirby appliance. The order of merit of the various devices is declared to be as follows:—1, Kirby; 2, Jones; 3, Elliott; 4, Cowey Indicator; 5, Gratz; 6, Vulcan; 7, Cowey Recorder; 8, Warner, and 9, Staunton. The Club's silver medal has been awarded to the Corelanus tail lamp, and a silver medal to the Ryta tail lamp.

## THE FROME'S HILL CLIMB.

THERE has always been a good understanding between the local authorities and the automobilists of Herefordshire, fostered by tact and common sense. During the Light Car Trials of 1904 the district surveyors were instructed by the county authorities to make clear the way of the voyagers, and those who journeyed to Hereford last week found that some of the spirit then manifested is still in vogue. In the previous trials on Frome's Hill, out of thirty-eight cars that essayed the ascent the times of only twenty-three were published in the official report, the speeds attained ranging from 5.4 miles to 11.8 miles per hour. At the trial held last week cars of a higher power were conspicuous, the arduous nature of the ascent having drawn many new competitors to the county of Churches and Cider.

When the cars arrived in the generally somnolent city of Hereford, on the 23rd ult., the rain was descending in torrents, and the roadways presented a greasy welcome to the contestants as they came from all parts of the country. Everyone was

long, and though there is a welcome relief half-way up, the greatest test is very near the top, a strip of fifty yards or so having the stiff gradient mentioned.

Of 67 entries in the open classes 62 cars actually started, a splendid muster that must have impressed the spectators, among whom agriculturists from all the surrounding district were prominent. The behaviour of most of the cars was excellent.

Each car was allowed to make two ascents, and the fastest runs were those of the following:—

1. Mr. Greswolde-Williams's 30-40-h.p. Daimler.
2. Mr. C. Friswell's 30-h.p. Peugeot.
3. Mr. C. Jarrott's 40-h.p. Crossley.
4. Mr. C. Edge's 40-h.p. Napier.

Other good runs were made by Mr. Thornycroft's 24-h.p. Thornycroft, Mr. Douglas Graham's 30-40-h.p. Martini, Mr. C. Friswell's 30-h.p. Westinghouse, the Hon. C. S. Rolls's 20-h.p. Rolls-Royce, Mr. Norman Parish's 15-h.p. De la Buire, Mr. T. H. Woollen's 20-h.p. Clement-Talbot, Mr. Gerald Usmar's 14-h.p. Vinot, Mr. Philip Graham's 16-h.p. Rover, Mr. Robert Burn's 9-h.p. Swift, Mr. R. L. Jefferson's 8-h.p. Rover, and Lord Shrewsbury's 12-h.p. Clement-Talbot.

The Frome's Hill Climb. Mr. E. E. Leverett's 24-30-h.p. Standard Car.

expressing surprise at the interest aroused in the contest; and the Herefordshire Club in general, and its hon. secretary, Mr. Wilfrid Groom, in particular, are to be congratulated on the importance assumed by the meet. The officials were as follows:—Judge, Capt. A. A. H. Inglefield (Breinton); clerks of the course, Mr. T. Butt Ekins, Mr. Q. Miller, and Mr. J. C. M. Vaughan; timekeepers, Mr. T. D. Dutton and Mr. A. V. Ebbelwhite (official timekeepers of the Automobile Club of Great Britain and Ireland, under whose rules the contests took place); starter, Mr. A. Townsend; marshal, Mr. J. W. Orde; secretary of the meeting, Mr. Wilfred Groom; clerk of scales, Mr. J. Russell.

On Thursday the weather was more genial, although the spell of sunshine was broken by heavy storms which laid the dust and inconvenienced many of the competitors. Taken altogether, however, the day was a delightful and interesting one for the hundreds of people who assembled at the trysting place, and the panoramic views of the surrounding pastoral country obtained from the summit of the hill greatly enhanced the pleasure of all.

Frome's Hill, which is situated about half-way between Bromyard and Ledbury, near the Worcestershire border of the county, is a veritable *dele nobis* to the motorist, having a gradient at its steepest part of one in 6.37. Withal the rise is a mile

The award was made on a handicap determined by multiplying the time in seconds by rated horse-power, and dividing by the total weight of car and passengers in pounds. Horse-power was arrived at by multiplying the square of cylinder-diameter in inches by the number of cylinders, and dividing by three. When the results were worked out by Mr. J. Lingham Lees, with the assistance of several pupils from one of the public-schools of the county, it was seen that the placings and awards were as follows:—

- Gold medal, 10-h.p. Alldays, driven by Mr. F. W. Huband.
- Silver medal, 10-h.p. Alldays, driven by Mr. S. Downing.
- Bronze medal, 10-12-h.p. Clement-Talbot, driven by Mr. S. Kennedy.

On Wednesday morning we were informed that a mistake had been discovered, and that Mr. C. R. Garrard's 12-16-h.p. Clement-Talbot had tied for the Gold Medal. The 10-h.p. Clement-Talbot driven by Mr. T. W. Bowen was fourth. This conspicuous success of British cars in such a large competition of international character is certainly notable, especially when read in conjunction with the prize list in the closed competition at the same meeting.

In the club handicap Mr. W. Groom (6½-h.p. Wolseley) took first prize, Mr. F. W. Greswolde-Williams (32-h.p. Daimler) second, and Mr. W. Bradford (8-h.p. Vulcan) third prize.

## SOME CURRENT TOPICS.

### The Gordon Bennett Cup Race.

Considerable surprise has been caused in French motoring circles by the news that, at the demand of the Automobile Club of Great Britain and Ireland, a meeting of delegates of all recognised national automobile clubs is to be held at Pont de Genes (Sarthe), on the 25th inst., to consider the question of the future of the Gordon Bennett cup. The proposals of the A.C.G.B.I. to be submitted to the meeting, which is to be held on the day preceding the contest for the Grand Prix de l'A.C.F., are as follows:—(1) That the Gordon Bennett cup shall continue to be a speed contest. (2) Recognised national clubs shall be represented by three cars. (3) The race shall be over an approximate distance of 500 kilometres, and held on a 50-kilometre circuit. (4) The cars not to weigh more than 850 kilogs.,

### Brakes for Motor-Cars.

There has been a very general and marked improvement in the braking devices on motor-cars during the past few years, and if accidents due to ineffectiveness of brakes still occur, it is generally the fault of the drivers in not keeping them properly adjusted. The improvement has been partly a natural development, and partly necessitated by the increase in horsepower and speed which has characterised automobile design in recent years. There seems to be no need of further increase of braking power, as in many cars the brakes are sufficiently energetic to cause the wheels to slide on the ground if applied with full force, which is undesirable; and further improvement should be in the direction of preventing as much as possible their liability to get out of adjustment.

### External or Internal Brakes?

The rivalry between the external contracting and the internal expanding brake has largely turned in favour of the latter in recent years, owing to its theoretical advantages of better facilities for enclosing and protection against wearing

Some of the Competitors at the Midland Automobile Club's Gymkhana. To the left of the picture are seen some of the novel obstacles employed. (See page 312.)

the balance of 150 kilogs. being made up with ballast. It is considered that this distribution of weight would be more calculated to perfect touring vehicles than the old 1,000 kilog. limit. Further proposals are that the cars shall be driven by members of the clubs taking part; entries to close on December 31st, and the race to be run in May or June. As was to be expected, the proposals are meeting with opposition in France, where it was thought that the Gordon Bennett contest was as dead as Queen Anne. The French objection to the race on the old lines was that in view of the relative importance of the motor-car industry in France, as compared with other countries, they were entitled to a proportionately larger number of entries in the contest, and it was with the object of securing this point that the Grand Prix was instituted. The same objection is being raised to the new proposals, and, with the view of strengthening their case, the French Press is magnifying the importance of the industry in Italy, with the idea of winning over the Italian Club to its way of thinking. The result of the deliberations of the international meeting will, therefore, be awaited with interest.

influences. As a result of experience, however, there are many motorists who incline to the opinion that the preference is likely to soon turn the other way. It is urged that the internal expanding brake possesses in a minimum degree the valuable quality of self-adjustment for wear, and that, although its actual wear may be somewhat less, the need of adjustment is much more frequent. An internal brake operated on the toggle principle may be enormously powerful when perfectly adjusted, but comparatively little wear will throw such a brake out of adjustment, when it becomes practically useless. This fault is aggravated by the fact that in an enclosed internal brake the means for adjustment are rather inaccessible, and the chance of neglect are therefore multiplied.

ATTENTION may well be drawn to the merits of the Liquid Metal Polish which Messrs. Brown Bros., are introducing. For the polishing of all bright parts of motor-cars it will be found useful, its special features being that it does not leave anything of a greasy nature on the articles treated, but polishes clean, and does not scratch. It is known as the "Une Minute."

## THE ITALIAN COPPA D'ORA TOURING CONTEST.

IN our last issue we left the competitors in this event at Milan. On the ninth day of the trial the journey was from Milan to Udine, the longest of the series, the distance between the two places being 292 miles. The start took place at 4.30 a.m., the cars which were despatched comprising two Napiers, two Italas, two Fiats, a Zust, two Isotta-Fraschinis, two Benz, three Diatto-Clements, two Martinis, and a De Dion. The weather showed a considerable improvement, and, notwithstanding the long distance that had to be covered, all but one safely arrived well up to time. The absentee was M. Martini, on a Martini car. On the 23rd ult. the competitors set out from Udine to Brescia, 252 miles. An early start was made and an excellent run was made by the cars, no less than fourteen getting through without the loss of any marks. Von Lude,

No.	Driver.	Car.	H.	M.	S.
4.	Nazzaro ...	Fiat ...	0	0	14
5.	Boschis ...	Fiat ...	0	1	27
6.	Macdonald ...	Napier ...	0	2	28
7.	Glentworth ...	Napier ...	0	6	51
8.	Fraschini ...	Isotta-Fraschini ...	0	12	2
9.	Pfanz ...	Benz ...	0	40	51
10.	Bossano ...	Benz ...	1	19	11
11.	Vercellone ...	Diatto-Clement ...	1	23	35
12.	Minoia ...	Isotta-Fraschini ...	1	28	44
13.	Arbitrie ...	Diatto-Clement ...	1	43	20
14.	Fabry ...	Itala ...	3	18	44
15.	Von Lude ...	Martini ...	5	48	26
16.	Nagliate ...	De Dion ...	9	32	53

The awards were made known on Saturday. Lancia is the winner of the Coppa d'Ora, or gold cup, and the prize of £1,000; he also secures the cup offered by the "Corriere della Sera" and the prizes of the cities of Florence, Biella, Turin and Udine, and of the Ministry of Agriculture. Maggioni carries off the King's Gold Medal, the L'Automobile Cup, and £240; Cagno obtains

Glentworth on the Napier Car which secured the seventh position in the Trial.

(Martini) and Nagliati (De Dion) experienced slight delays, while Nasi (Diatto-Clement) did not arrive until after the control was closed, thus putting him out of the competition. The last run of the competition was made on the 24th ult. The trip was only a short one—from Brescia to Milan, 99 miles—so the start of the sixteen remaining cars did not take place till 1 p.m. The arrival at Milan was made the occasion of a brilliant scene. As the vehicles came in their drivers were welcomed by Princess Laetitia. Macdonald on his Napier was as usual the first to appear, and as soon as he came in sight the band struck up "God Save the King."

The appended table shows the finishing order of the sixteen competitors who survived the contest, a number which is just a third of those that started:—

No.	Driver.	Car.	Penalisation.		
			H.	M.	S.
1.	Lancia ...	Fiat ...	...	...	...
2.	Maggione ...	Zust ...	0	0	7
3.	Cagno ...	Itala ...	0	0	10

£120; Nazzaro, £60; Boschis, £40; Macdonald, Glentworth, and Fraschini, £20 each. All the others will receive a gold medal, Vercellone, in addition, securing the Darracq prize for the cheapest chassis and those offered by the town of Perousa.

The penalties in the case of the first twelve competitors were incurred for arriving at the control or "arrivo" 60 sec. short or over the time required to complete the day's journey at the maximum rate of 40 kilometres an hour. They reflect no discredit on the cars, but on the judgment of the driver in estimating the exact time he should arrive. In view of the excellent performance of the majority of the cars which managed to survive the trial, the disparity in the value of the prizes is to be regretted. Macdonald's case seems particularly hard, for to him fell the lot of leading the way on each of the eleven days, and his penalisation is apparently due to a discrepancy between watches. Not only has this affected his position in the list, but it has also robbed him of several of the cups offered by the municipal authorities of the leading towns passed through.

## SOME HINTS ON HOME WORKSHOPS.

BY J. H. KNIGHT.

-♦-

THE following description of a workshop that I put up, many years ago, may be of interest to some readers of the *M.C.J.*, as such a workshop would be invaluable for doing home repairs to motor-cars. It was in this shop that I made my steam carriage in 1868, which was illustrated in these columns some years ago. The workshop was about 18 ft. long by 12 wide, and was lighted by three skylights. I do not, however, recommend skylights, as they are apt to leak. A window also opened to an open shed, both north of the workshop; this shed was covered with galvanised iron.

A plan of the workshop, showing the positions of the tools, is given herewith. The tools consisted of a 6½ in. screw cutting lathe, with 6 ft. bed, worked by a 3 in. cylinder steam engine (the boiler being fired from the open shed); a hand planing machine; all drilling was done by a swing brace and drill post; a forge with anvil, screwing tackle for rod and gas piping, besides sundry smaller tools. There was really space for five

men to work in this shop, one at the lathe, at the vice, the drill post, the carpenter's bench, and the fifth at the forge. The shop was conveniently arranged, but the stoking of the boiler and the delay in getting up steam in the morning were sources of trouble. In the present day the steam-engine would be replaced by a gas-engine, or if gas were not available, an oil or petrol motor. A motor-bicycle of 1½ or 2-h.p. would do very well for driving the lathe, although one might ask why a 1½ or 2-h.p. engine would be necessary, as two men could work the lathe with a very fair cut on it, but unless the bicycle-engine was kept very cool by an efficient fan the power would soon fall off, as no air-cooled engine is likely to work as well indoors as in the open air. As the treadle shaft of a foot lathe runs at only 70 to 80 revolutions per minute, and the bicycle-engine at from 800 to 1,000 revolutions, some reducing gear must be employed. The simplest plan would be to put in a counter-

shaft and drive this by a chain from the motor; it would be better still to have a small spur-pinion on the motor gearing into a wheel of considerable size on the countershaft, and drive the lathe from this shaft by pulleys and a belt, fast and loose pulleys being placed on the treadle-shaft of the lathe. As the attachments of small bicycle-engines differ in each make, it is almost impossible to give drawings that would be of any use of the method of fixing engine on to its bearers. A water-cooled engine would be far better than an air-cooled one. An empty paraffin oil cask, which can be bought for about three shillings, makes a very good cooling water-tank. The engine would be best placed outside the workshop, as the noise of the working would be a nuisance. The belt would be brought through a hole in the wall, and a light movable cover would protect engine from rain. If a petrol engine be used, the insurance company must be informed of it; although insurance companies do not object to a motor-car being on the premises, it is extremely probable they would require some additional premium if a petrol engine were used to drive a lathe. The company might also insist on the engine being some distance from the workshop, and placed in a small brick house by itself. There are some small gas engines at very low prices in the market, and as these run at a lower speed than the cycle motors, one of them would be better, if a supply of gas is procurable.

As regards tools, a hand shaping machine is preferable to a hand planing machine. These shapers are sold by several of the tool dealers who exhibit at motor-car and other shows. A small emery grinder is useful for grinding away anything that is too hard for a file to touch, such as parts of the gear in motor-cars when the edges have become rounded off or burred with wear. It consists of an emery wheel about 6 in. in diameter, driven by a handle from a small fly-wheel, the latter being mounted on a free wheel clutch, so that it only rotates in one direction; on its spindle is coiled one end of a leather thong, the other end being attached to a treadle on the floor. The up and down motion of the foot rotates the fly-wheel, and consequently the emery wheel, at a high speed. An adjustable rest close to the wheel supports the object to be operated on. The machine is fixed to a table or bench by two or three stout wood screws. The price is about £1 5s. Some people run an emery wheel on a mandril in a lathe, but this is a bad practice; few lathes run fast enough for an emery wheel, and the emery dust must be injurious to the lathe.

The acid method of sharpening files is one of those things not generally known. If an old worn file be examined and compared with a new one, the ridges of the teeth will be seen to be flat and bright owing to wear, and consequently the file will no longer cut. To make the file in good condition it should be carefully cleaned with card cloth, and then washed in hot water in which some soda has been dissolved, to remove any grease. After this it should be washed in water to get rid of the soda, and placed in a tall deep vessel containing dilute acid; the latter immediately attacks the metal, eating it away, and restores the cutting power of the file. I have found a mixture of equal parts of nitric and sulphuric acid, diluted with five or six times its bulk of water, to act well. The time varies from about one to ten minutes, or even more; it depends on the state of the file and the strength of the acid. The operation should be conducted out of doors, as the fumes of the acid are injurious to the throat and lungs, and will attack and rust any metal that may be near; sometimes the acid bubbles up and overflows. When the file seems to be like a new one in appearance it should be well rinsed in clean water and dried before use. This method will not make an old file into a new one, but it is a useful method if a file is so worn that it will not cut, and a new one cannot be procured at once.

ACCORDING to the report of the Comptroller-General of Patents, Designs, and Trade Marks, the number of inventions relating to the framework and general arrangement of motor-cars was about the same in 1905 as in the previous year.

## SCOTTISH NOTES.

BEFORE the successful Reliability Trial of last year Scottish prowess in organisation had been demonstrated by the Glasgow to London runs which were once a feature of the automobile year. The last of these took place in May, 1904, when thirty cars started from Glasgow. Seven obtained non-stop certificates, and another seven secured more than 990 marks out of a possible 1,000.

IN a recent issue we gave the rules governing the forthcoming Reliability Trial. Reference may now be made to some important differences in the routes of last year and this, the first and fourth day's journeys being varied from those of 1905. Instead of Dundee being the objective of the first day's run, a circuitous run through Ayr, Dumfries, and Peebles will be made, and rest taken at Edinburgh. And on the fourth day, instead of the Aberfeldy hill climb, the way out from Pitlochry will be through the Pass of Killiecrankie to Blair Athole and Trinafour, where the ascent will be up a distance of 1,817 yards, with a total rise of 317 ft. Some who have been on the road near Braemar

The clutch is of a new metal-to-metal multiple disc type running in oil, while the change-speed gear provides three speeds forward and a reverse, the top gear being a direct drive. The 16-h.p. two-cylinder car is the one which gained the gold medal in the 1905 Reliability Trials; since then it has been running as a demonstration and general utility vehicle. Its general features are sufficiently well known as not to require further reference at this time. During last year's trials the car ran on solid tyres on all four wheels. This year 4 in. pneumatics have been fitted to the front wheels, in view of the fact that a delay due to puncture will not necessarily deter the car from gaining the medal in its class, as a non-stop run is not necessary for this. The rear wheels are, however, still shod with solids, the object of the Albion Company being to demonstrate the fact that a car properly designed and constructed for solid tyre work is as efficient in every way as one running on pneumatics.

AN interesting district of South-West Scotland has been opened up by the completion of the Maidens and Dunure Railway, over which traffic is now running. Constructed by the Glasgow and South Western Railway, the line extends in a

and at Tomintoul report that recent rough weather has left the roads in a very loose state.

THE following further entries have been made at double fees, viz., Messrs. Benz and Co. (London), 40-h.p. Benz; Major J. W. Fraser (Brechin), 10-h.p. Argyll; Messrs. Sidney Straker and Squire, Ltd. (London), 28-h.p. Straker; and Captain R. B. P. Lybbe (London), 30-h.p. six-cylinder Standard.

THE Albion Motor Car Company, Ltd., have entered two of their Albion cars for the forthcoming Trials, one being a 24-h.p. four-cylinder side-entrance tonneau, and the other a 16-h.p. two-cylinder vehicle. This is the first appearance of the 24-h.p. car in a public trial, and its performance will doubtless be watched with interest. The motor comprises four cylinders, 4½ in. bore by 4½ in. stroke, developing 24-h.p. at 1,200 revolutions per minute. The lubrication is by means of the Albion patent mechanical lubricator, which is positively driven by the engine, and ensures a constant rate of feed of oil to the motor proportionate to the speed at which the latter is running. The control of the engine is by means of the Murray governor, which in turn controls the timing of the ignition gear.

southerly direction from near the town of Ayr to Girvan, and is 19½ miles in length. At Turnberry, about fifteen miles from Ayr, the passenger station is provided with a covered way, which leads directly to the new hotel which the Glasgow and South Western Railway Company have built. This hotel is situated at a height of about one hundred feet above sea level. Motorists have been catered for by the erection in the grounds adjoining the hotel of a motor garage which will accommodate between forty and fifty motor-cars.
